Residual stresses will be introduced into polymer sheets by thermal quenching and/or mechanical deformation. The three-dimensional stress states will be measured by ultrasonic wave techniques. The latter, together with optical birefringence studies and stress analysis methods, will be employed to distinguish between elastic locked-in stresses and the residual molecular orientation due to flow of the polymers. The effects of the various residual stress states on the physical properties of the polymers will be determined, with consideration to stress relaxation.

SUPPORTED BY U.S. Dept. of Defense, Army Materiel Development & Readiness Command, Army Research Office

3.0008, DEVELOPMENT OF THE THEORY OF REFLECTANCE AND EMITTANCE OF FIBROUS MATERIALS 14076

J.R. Aronson, Arthur D. Little Inc., *15 Acorn Park, Cambridge, Massachusetts* 02140 (DA0F8932; DAAG29 77 C 0

To develop the theory of reflectance or emittance of particulate materials so as to apply it to fibrous materials. Relevance - the research is relevant to the Army's interest in the areas of laser hardening, camouflage, and thermal insulation.

Specifically, research efforts will be concerned with obtaining the optical constants of model materials, constructing a theoretical model of the reflectance or emittance of fibers and making experimental measurements of the infrared emittance to verify and modify the developing theory.

SUPPORTED BY U.S. Dept. of Defense, Army Materiel Development & Readiness Command, Army Research Office

3.0009, VISCOUS FLOW AND CRYSTALLIZATION BEHAVIOR OF HYDROCARBON MIXTURES

D.R. Uhlmann, Massachusetts Inst. of Technology, School of Engineering, Dept. of Metallurgy & Materials Science, *77 Massachusetts Ave., Cambridge, Massachusetts* 02139 (NSG 3286)

3.0010, MICROSTRUCTURE OF AMORPHOUS AND SEMI-CRYSTALLINE POLYMERS

D.R. Uhlmann, Massachusetts Inst. of Technology, School of Engineering, Dept. of Metallurgical & Materials Sciences, *77 Massachusetts Ave., Cambridge, Massachusetts* 02139 (DF046980; AFOSR-77-3226)

AF function - advanced aircraft systems will utilize lightweight polymeric and adhesively bonded structural components and composites and impact resistant transparent canopy materials. Deficiency - although the mechanical and optical properties are determined by processing, the fundamental understanding governing behavior is inadequate. Objective -selected microstructural features of amorphous and semi-crystalline polymers and their relation to processing and mechanical, physical and optical properties will be investigated. How work contributes - this research will help develop the understanding regarding the character of supramolecular structure and the importance of specific morphological features in determining properties which is needed for processing matrix and adhesive resins whose chemistry and microstructure can reproducibly be tailored to specific needs.

The study will explore (1) nodular structures in amorphous thermosetting and thermoplastic polymers (2) chemical and structural differences between bulk material and near-surface regions in semi-crystalline polymers (3) crystallization behavior under high thermal gradients and its effect on structure and (4) differentiation between adjacent re-entry folding and switchboard models for the basic structural units in semi-crystalline polymers. In each case a combination of experimental techniques will be used to elucidate the important structural features of the materials and their variations with changes in process conditions. The structural features will in turn be related to the mechanical and optical properties of the materials with specific attention directed to yield and fracture behavior and to transparency at optical frequencies.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Office of Scientific Research

3.0011, ORGANOSILICON COMPOUNDS AND ORGANOSILICON POLYMER INTERMEDIATES

D. Seyferth, Massachusetts Inst. of Technology, School of Science, Dept. of Chemistry, *77 Massachusetts Ave., Cambridge, Massachusetts* 02139 (DF041490; AFOSR-76-2917)

AF function - future Air Force flight operations require better environmental resistant materials. Deficiency - fluids and lubricants are needed as hydraulic fluids, coolants, engine oils and gyro fluids. Seals and sealants serve indispensable needs for fuel, liquid and air retention, and expulsion bladders in liquid rocket systems. Objective -a study of the synthesis and properties of new organosilicon compounds which may prove useful for these purposes. How work contributes - the work will provide new compounds and new methods of synthesizing organosilicon and related compounds.

The research will involve a study of the chemistry of silacyclopropanes, including ring opening reactions and dimethylsilylene extrusion, the chemistry of silacyclopropenes, and the Diels-Alder route to arylene-bridged disilanes suitable for organosilicon polymer preparation.

3.0012, EFFECT OF STRUCTURE ON PHYSICAL POLYMER INTERACTIONS AND PROPERTIES

F.E. Karasz, University of Massachusetts, Amherst Campus, School of Engineering, Dept. of Polymer Sciences & Engineering, *Amherst, Massachusetts* 01002 (DF043340; AFOSR-76-2983)

AF function - advanced aircraft employ structural materials which require superior performance characteristics over a broad range of temperature and environmental conditions. Deficiency - new high-temperature polymer systems are difficult to process and the effects of processibility on properties and life expectancy for these systems are not understood. Objective - this research is to study how molecular structure and morphology on a supermolecular scale govern polymeric interactions and the resultant physical and mechanical properties. How work contributes - it is expected that this research will generate information for the processing of intractable, high temperature resin systems and self-reinforced or molecular polymeric composites and the design of mechanisms to overcome the polymeric degradation due to temperature-humidity effects.

Polymer physical chemistry will center on (1) development of the specific principles for predicting compatibility and alloying in multi-component polymer systems, (2) assessment of the interaction of water with epoxies to include determination of the kinetics and equilibrium properties of the interactions and analyses in terms of a bound-water model, and (3) characterization of the conformational states of rigid chain polymers using polybenzoximidazole as a model.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Office of Scientific Research

3.0013, EUTECTOID DECOMPOSITION IN TITANIUM ALLOYS

H.I. Aaronson, Michigan Technological University, School of Engineering, Dept. of Metallurgical Engineering, *Houghton, Michigan* 49931 (DF038240; AFOSR-74-2595)

AF function - a rational basis for materials development is required to assure the availability and effective utilization of structural materials in future Air Force systems. Opportunity - the fundamental methodology to provide comprehensive and systematic improvement of existing metallic materials and creation of new materials is dependent upon an understanding of the physical metallurgy of alloys. Objective - this investigation will deduce the principles underlying the eutectoid decomposition processes in titanium alloys. How work contributes - understanding of these phase transformations is necessary in order to furnish a more substantial base for the development of useful titanium alloys in which these processes play an important role in determining their microstructure and mechanical properties at room and moderately elevated temperatures.

Specifically, this research will determine why the massive transformation of beta to fully supersaturated alpha occurs in some Ti-X eutectoid systems but not in others, and the ability of the bainite reaction to compete with pearlite formation in hypo-eutectoid and eutectoid alloys.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Office of Scientific Research

3.0014, BERLINITE CRYSTAL GROWTH

R.F. Belt, Litton Precision Products Inc., *200 E. Hanover Ave., Morris Plains, New Jersey* 07950 (DF903140; F19628-77-C-0213)

Air Force function - navigation, communication, surveillance. Deficiency - presently available resonator materials cause long term frequency drifting. Objective - to develop superior material for both timing and acoustic surface wave devices. How research contributes -development of new possibly superior material may result in improved timing and acoustic surface wave devices.

The approach will be the study and growth of berlinite (aluminum phosphate) of sufficient size and quality for evaluation as timing and acoustic surface wave material. The hydrothermal crystal growth technique will be used.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Rome Air Development Center

3.0015, RESEARCH ON UNSTEADY COMBUSTION PROCESSES

L. Caveny, Princeton University, School of Engineering & Applied Sciences, Dept. of Aerospace & Mechanical Science, *Box 430, Princeton, New Jersey* 08540 (DF045780; AFOSR-76-3104)

AF function - most advanced Air Force strategic and tactical rocket weapons rely on solid propellants for propulsion. Deficiency - more energetic and reliable propellants are required for future weapons. Objective - this research is aimed at increasing the understanding of the unsteady combustion process which occurs in solid propellants, especially in the areas of velocity coupled instabilities and the burning of aluminum droplets. How work contributes - the understanding gained will permit the design of more reliable high performance missiles.

Three directions of study are being pursued simultaneously in this broad investigation of solid propellant combustion. The first is a combined analytical and experimental effort centered

around the modulated throat rocket motor (MTRM), which is a system for gathering meaningful data over a wide range of realistic operating conditions of actual small motors. The dynamic responses of the combustion process to external excitation of longitudinal pressure and velocity waves are measured as functions of frequency, mean pressure, propellant characteristics, internal Mach number and propellant geometry. The second research topic is elucidation, primarily through high-speed photography, of the agglomeration and combustion processes for aluminum particles in propellants. Size, purity and pretreatment of aluminum particles, as well as chamber pressure and cross-flow velocity are variables. In the third portion of the effort, break-up of aluminum and alumina agglomerates in the accelerating flow-field associated with entering or approaching the rocket nozzle will be examined both experimentally and analytically.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Office of Scientific Research

3.0016, FUELS COMBUSTION RESEARCH

I. Glassman, Princeton University, School of Engineering & Applied Sciences, Dept. of Aerospace & Mechanical Science, *Box 430, Princeton, New Jersey* 08540 (DF001830; F49620-78-C-0004)

AF function - weapons delivery, air support, airlift. Deficiency -accurate modelling of combustion and exhaust plume processes in present and future aircraft engines requires much more reliable numerical values of molecular reaction rates than are presently available. Objective -as an AFOSR center for fuels combustion research, this group will perform research leading to understanding of kinetic mechanisms and to accurate values of reaction rate constants for pyrolysis and oxidation of hydrocarbon constituents of present and alternative fuels. How work contributes - the results of these experiments are directly useful to design engineers in jet combustion and plume technology and also to scientists working on the elusive problems of combustion dynamics.

High-temperature homogeneous gas-phase reaction kinetics of hydrocarbon fuel constituents are being studied in flow reactors. The extensive concentration and temperature data obtained as functions of reaction time are used to obtain the correct kinetic mechanisms and global rates and rate constants. Spectroscopic and mass spectroscope capabilities are being added to obtain rate constants of reaction steps involving free radicals and many large product species. The mechanisms of soot formation and of carbon oxidation are also to be studied in experiments yet to be devised. A theoretical effort will be devoted to development of an efficient and comprehensive kinetic sensitivity analysis.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Office of Scientific Research

3.0017, VAPORIZATION AND COMBUSTION OF MULTICOMPONENT FUEL DROPLETS

W.A. Sirignano, Princeton University, School of Engineering & Applied Sciences, Dept. of Aerospace & Mechanical Sciences, *Box 430, Princeton, New Jersey* 08540 (ENG7812564)

The research deals with an experimental and theoretical investigation of the vaporization and burning of liquid fuel droplets which contain more than one chemical component. The objective is the prediction of the transient rate of vaporization of individual components from multicomponent liquid fuel droplets during vaporization and burning in convective flow. The predictions are compared with experimental measurements. Two-component fuel droplets of small size are collected from a high velocity, high temperature laminar gas flow. Fuel components of relatively low boiling temperature are used to preclude droplet pyrolysis. A new phase-discriminating droplet collection probe is used. The efficiency of the probe is being inve tigated. The chemical composition of collected droplets are determined with a gas chromatograph. The research provides a model of droplet burning. The model is related to combustion in diesel engines, gas turbines and furnaces.

The research is a continuation of work done under NSF Grant ENG7681253.

3.0019, STRESS INDUCED HYDROGEN CONCENTRATION CHANGES IN TITANIUM PHASE III

P.N. Adler, Grumman Corp., Grumman Aerospace Corp, *S. Oyster Bay Rd., Bethpage, New York* 11714 (DF043350; F44620-76-C-0071)

AF function - hydrogen embrittlement is a serious problem that causes mechanical property degradation in our most significant aircraft materials including steels, titanium, aluminum and nickel-base alloys. Hydrogen related phenomena are suspect of playing key roles in the mechanisms of stress corrosion cracking, subcritical crack growth, hot salt corrosion, weld cracking, temper embrittlement, fatigue crack growth, and brittle fracture in general. Opportunity - stress induced hydrogen concentration changes appear to be basic to this problem. Objective - this research will determine the extent and kinetics of the hydrogen redistribution that takes place in titanium alloys under the influence of elastic and plastic deformation. How work contributes - the vazious forms of hydrogen-related mechanical property degradation severely restrict the serviceability of our important aircraft materials. Basic understanding of the manner by which hydrogen acts to reduce mechanical strength and cause failures is important if we are to minimize and control these forms of attack.

Objective will be accomplished using Grumman's recently developed lithium nuclear microprobe (LNM) technique that enables in situ hydrogen concentration measurement in the surface of samples while under an applied stress. The results of these measurements will permit evaluation of the manner by which hydrogen participates in crack propagation and embrittlement.

3.0022, INFLUENCE OF COMPOSITION AND MICROSTRUCTURE ON THE LOW-CYCLE FATIGUE RESISTANCE OF A-PHASE AND NEAR A-PHASE ALLOYS

J.C. Williams, Carnegie Mellon University, Inst. of Technology, Dept. of Metallurgy & Materials Science, *Frew Ave. & Margaret Morrison, Pittsburgh, Pennsylvania* 15213 (DF042420; AFOSR-76-2925)

AF function - titanium and its alloys have been of considerable interest to the Air Force because of very favorable strength-to-weight characteristics at temperatures from cryogenic up to 800 degrees F, and resistance to attack by many chemicals. Potential applications for skins, structural and engine components of nigh performance aircraft, cryogenic fuel storage tanks for missiles, and tubing for transporting corrosive fuels all emphasize the available materials roles for titanium alloys. Opportunity - the occurrence of strain localization due to the development of localized regions which are plastically unstable results in severe reductions in fatigue and ductility of many high strength structural materials including certain titanium alloys.

Thus, the critical strain for fracture can be locally surpassed at very low average macroscopic strains, since such instabilities can lead to premature failure. Objective - this research will provide an improved understanding of the metallurgical factors which control strain localization, and the relationship of strain localization phenomena to low-cycle fatigue performance of alpha-Ti alloys. How work contributes -the use of alloys which exhibit the tendency for strain localization requires particular caution since the tolerance for local stress concentrations is reduced.

The program consists of two interrelated tasks: (1) the role of alloy composition in controlling deformation behavior and the relationship between deformation behavior and low-cycle fatigue performance, and (2) the role of microstructure on deformation behavior and low-cycle fatigue performance.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Office of Scientific Research

3.0023, DIRECTIONAL SOLIDIFICATION OF NONOXIDE EUTECTICS 14069-MS

V.S. Stubican, Pennsylvania State University, University Park Campus, School of Engineering, Dept. of Materials Science, *101 Hammond Bldg., University Park, Pennsylvania* 16802 (DA0E9298; DAAG29 77 G0057)

Study the directional solidification of several refractory carbide and boride compositional systems which exhibit eutectics, and relate the resulting microstructures to selected mechanical properties of the materials. Relevance - the materials to be studied may find use as high temperature unlubricated bearings for helicopters, as ceramic tool bits, as high temperature ceramic turbines and adiabatic diesel engines for Army vehicles, and as high temperature missile components.

Determine the crystallography of the eutectic systems and elucidate the fundamental factors which determine the topotaxial relations, measure the three and four point bend strength of the specimens as a function of temperature up to 2000 C, and evaluate the microhardness and wear resistance of the specimens.

3.0024, PROPERTIES OF MA ERIALS FOR ADVANCED ENERGY SYSTEMS

M.M. Abraham, U.S. Dept. of Energy, Oak Ridge National Lab., *P.O. Box X, Oak Ridge Operations Office, Oak Ridge, Tennessee* 37830 (AK-01-02-02-2; W7405-ENG-26)

This program consists of three major tasks concerned with the determination of fundamental information on the properties of materials that will be needed to develop new technologies for the production, storage, and transport of energy. Research on the physical properties of ceramic materials is directed toward obtaining a better correlation between the desirable macroscopic behavior of ceramics and their microscopic properties. Investigations on the physical properties of superconductors are concerned with methods for obtaining higher critical current densities and higher transition temperatures. The program on the research and development of pure materials involves the determination of new techniques for the purification, crystal growth and characterization of research quality materials that are needed in the research and development programs sponsored by DOE. 4.0003, THIN FILM OPTICAL DEVICES AND QUANTUM ELECTRONICS

A. Yariv, California Inst. of Technology, Graduate School, Dept. of Engineering & Applied Science, *1201 E. California Blvd., Pasadena, California* 91109 (DF041480; AFOSR-78-3685)

AF function - the Air Force seeks decreased distortion in fiber optic transmission for avionic system miniaturization, cost reduction, and bandwidth extension and novel tunable lasers especially solid state for optical communication and electronic warfare including jamming. Opportunity - exploration of novel pioneering concepts for devices for optical communication and electronic warfare. Objective - to investigate 1) direct transmission of optical information through optical fibers of kilometer lengths, 2) interaction of electron beams with longitudinal EM waves in a periodic structure environment, 3) Raman scattering in optical fibers experimentally and theoretically. How work contributes -success in objectives will lead to devices useful for optical communication and electronic warfare systems.

1) Compensate for distortion in transmission of optical information in optical fibers through introduction of phase conjugation by means of four wave-mixing, 2) attenuate velocity spread of electrons as electrons propagate in periodic structure and interact with longitudinal EM wave by cascading periodic structures with compensatory entry phases, 3) compare experiment with theory of optical fiber Raman laser and construct this laser including tuning by Franz-Keldysh effect.

4.0004, ADVANCED MISSILE AERO CONTROL INVESTIGATION

M.D. Thomas, Lgarde Inc., *1555 Plancentia Ave., Newport Beach, California* 94304 (DA0G1033; DAAK40 78 C 0072)

The objective of this effort is to investigate the adaptation of a movable aerodynamic flare to present and advanced missile systems in order to compare increases in control effectiveness and maneuverability characteristics.

A conceptual design of the advanced aerodynamic control, adapted to existing Pershing II and Patriot missile systems, shall be accomplished to provide baseline configurations from which performance calculations can be made to determine increases in

maneuverability and a reduction in control system weight thus providing a lower systems cost. An open-loop 6 DOF simulation shall be performed to ascertain the performance when comparisons are made between the baseline configurations and the existing Pershing and Patriot missiles. A plan for a flight demonstration program to include recommendations as to possible flight test boosters as well as test ranges, costs and other related parameters shall be developed and submitted as part of the final report.

4.0005, SINGLE CHIP CCD LENSES FOR ULTRASONIC IMAGING

J.D. Meindl, Stanford University, School of Engineering, Dept. of Electrical Engineering, *Stanford, California* 94305 (DF050130; F49620-77-C-0133)

AF function - the maintenance and quality assurance of flight vehicles relies heavily on nondestructive evaluation (NDE) of critical metallic components. Deficiency - there is a deficiency in techniques to specify size, shape and orientation of flaws which initiate catastrophic failure. Objective - the objective of this research is to develop electronic focusing of acoustic field patterns detected by piezoelectric transducer arrays. How work contributes - the monolithic electronic lenses would serve to reduce present ultrasonic imaging system weight, volume, power consumption and cost as much as an order of magnitude. In addition, they would permit improvements in system resolution, field of view, range and frame rate heretofore unfeasible.

Cascade charge coupled device (C3D) integrated circuit analog delay lines will be explored for ultrasonic imaging systems. Various models will be developed to characterize the influence of device technology on lens performance. Theoretical analysis and fabrication methodology will be adjusted to optimize performance.

4.0006, SUPERCONDUCTING WEAK LINKS FOR MIXING AT MILLIMETER-WAVE FREQUENCIES 13678-EL

T.V. Duzer, University of California, Berkeley Campus, Graduate School, *2200 University Ave., Berkeley, California* 94720 (DA0E9086; DAAG29 76 G0191)

To study novel schemes for detection and mixing in the millimeter and submillimeter wave range. This work will have a long range impact on millimeter and submillimeter wave programs in the Army such as the beam rider guidance system, or general radar and terminal homing applications.

To investigate Josephson junctions for low noise mixing and detection in waveguide applications (below 150 gHz), test wave impedance matching arrays for submillimeter wavelengths, and continue comparison between Josephson junctions and super-Schottky metal-insulator metal characteristics.

SUPPORTED BY U.S. Dept. of Defense, Army Materiel Development & Readiness Command, Army Research Office

4.0007, BASIC RESEARCH IN ELECTRONICS (JSEP)

D.J. Angelakos, University of California, Berkeley Campus, School of Engineering, Dept. of Electrical Engineering & Computer Science, *Berkeley, California* 94720 (DF008700; F44620-76-C-0100)

AF function - electronic research is essential to all Air Force missions and functions, especially aerospace reconnaissance, communications, surveillance, navigation, command and control of operating forces, and gathering, processing, and transmission of intelligence and information. Technology for all of these functions requires more compact, lower power consumption, higher sensitivity and more reliable electronic components, networks and systems. Opportunity - this technology is dependent on continued research on properties of electronic materials, circuits, and systems. Objective - the joint services electronics program (JSEP) provides the research baseline in the electronic sciences for all three military services. How work contributes - jointly and equally supported and managed by the Air Force, Army and Navy, this program provides the DOD with a hard core electronic research capability which includes a highly flexible, quick response to new research opportunities over a broad area of electronic science and engineering.

One part of the electronic research being conducted concerns solid-state electronics, and electro-magnetics. These areas entail fundamental theoretical and experimental studies of semiconductor devices, semiconductor properties and technologies, studies in select areas of electromagnetic wave guiding scattering and measurement techniques. This portion of the JSEP deals with research in large scale system theory, cizcuit analysis and synthesis, VLSI circuits, signal processing, and data base management systems. Specifically, new emphasis is being placed on problems arrising in data base systems distributed over many host computer systems.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Office of Scientific Research

4.0008, LASER-INDUCED FLUORESCENCE SPECTROSCOPY FOR MAKING IN-SITU SPECIES CONCENTRATION MEASUREMENTS IN TURBULENT COMBUSTION FLOWS

J.W. Daily, University of California, Berkeley Campus, School of Engineering, Dept. of Mechanical Engineering, *Berkeley, California* 94720 (DF049060; AFOSR-77-3357)

AF function - advanced diagnostic techniques, advanced air-breathing engines, weapon delivery and defense. Deficiency - inability to obtain reliable measurement of important parameters in turbulent reacting flows in practical hostile combustion environment via present day measuring and diagnostic techniques, inability to reliably evaluate combustion models. Objective - to develop sensitive selective, precise, reliable and rapid diagnostic methods for measuring important parameters in jet engine reacting flow environment. To determine feasibility of using laser induced fluorescence spectroscopy (LIFS) for obtaining high spacial and time resolution in-situ species concentration measurements in practical combustion environments, to determine capabilities and limitations of LIFS as a laboratory diagnostic tool, to provide reliable experimental data to the combustion modeler. How work contributes - will provide additional understanding and reliable data to permit realistic evaluation of analytical models of complex reacting flows, will help reduce development time and cost of air-breathing propulsion systems, will permit evaluation of capabilities and limitations of various diagnostic methods, will aid in development of improved or novel new in-situ nondisturbing techniques for accurately measuring turbulent reacting flow parameters.

Using laser-induced fluorescence spectroscopy techniques, measurements will be made of hydroxyl radical concentrations in two laboratory burners, one laminar and one turbulent. Standard burners will be used wherever possible. Initial work will involve examination of the OH spectrum in both flames, mapping interferences, temperatures, and concentrations using conventional absorption and emission spectroscopy. The OH fluorescence spectrum will then be measured in the laminar flame and saturation and trapping effects examined. Results will be used to optimize the excitation and detection schemes. Data acquisition electronics and signal processing will be developed. The system will be applied to the turbulent flame and fluorescence results compared with those from more conventional measuring techniques. The experimental procedures will be guided by and the results compared with a theoretical model that will be developed to describe the excited state populations of OH. Additionally, theoretical predictions of turbulence results will be made using standard theory for comparison with experimental results.

4.0009, TURBULENCE MEASUREMENTS BY RAYLEIGH SCATTERING

L. Talbot, University of California, Berkeley Campus, School of Engineering, Dept. of Mechanical Engineering, *Berkeley, California* 94720 (DF038830; F44620-76-C-0083)

AF function - aerospace vehicles, air-breathing propulsion, weaponry. Deficiency/opportunity - experimental study of turbulent flows associated with aerospace vehicles and their propulsion systems has been hampered in the past by the lack of non-intrusive measurement methods suitable for measuring all the desired quantities. Hot wires have produced much imxortant information, but they do disturb the flow, and they cannot survive many of the harsher environments in which it is desired to make measurements. The laser Doppler velocimeter (LDV) techniques promise a new dimension in turbulence measurements, but these can measure flow velocity only. Knowledge of turbulent fluctuations of temperature, gas composition, and gas density, as well as pressure and velocity, would contribute to the body of known information about turbulence and diminish the amount of speculative assumption that goes into scientific and engineering work with turbulent flows. The proposed work explores the recent innovation in gas velocity and temperature measurement by Rayleigh scattering, combining it with LDV or hot wire methods, to obtain data on both the temperature and velocity turbulence in hostile gas flow environments. Objective - to provide a practical demonstration of the use of Rayleigh scattered laser light for investigating turbulent flows in a severe environment, and at the same time to gain knowledge of the interaction of turbulence with exothermic reactions or other heat releasing processes in gas flows. How work contributes - many modern applications of gas dynamics involve flows in which chemical reactions occur. It is well known that turbulence in a flow can be amplified by an exothermic chemical reaction. A quantitative correlation between these phenomena could serve to clear up some troublesome questions about entropy layers, flame zones, and radiating or absorbing flows.

Extensive demonstration of the Rayleigh scattering diagnostic method, in combination with LDV will be made in experiments. Interaction of a Karman vortex street with a plane laminar flame, interaction of flat plate boundary layer turbulence with a standing flame, and survey of the flow field near a curved standing flame will be investigated.

4.0011, WAVES AND INSTABILITIES IN STEADY-STATE HIGH-BETA PLASMAS

N.C. Luhmann, University of California, Los Angeles Campus, School of Engineering & Applied Science, Dept. of Electrical Engineering, *405 Hilgard Ave., Los Angeles, California* 90024 (DF035050; F49620-76-C-0012)

AF function - operation of high-altitude vehicles in a post nuclear explosion environment, development of electromagnetic weapons, space and ionospheric communications as well as countermeasures demand the fundamental understanding of high-beta processes occurring in plasmas such as waves and instabilities caused by beams of particles and photons. Deficiency - the aforementioned information required to design advanced equipment is not available today. Its acquisition may be realized by a well planned theoretical and experimental research. Objective - this project will investigate both theoretically and experimentally the behavior of high-beta plasmas specifically studying their waves and instabilities, their interaction with electron and laser beams as well as the abnormally high appearing resistivities. Contribution - this work is a part of a comprehensive program of plasma research for the development of an x-ray radiation source for simulation of nuclear weapon effects, the development of advanced electromagnetic weapons (laser and particle beam), the development of space and ionospheric communications, and the development of countermeasures.

This project will perform theoretical and experimental work to specifically study the following - A. Interaction of the electromagnetic radiation with an inhomogeneous near critical density plasma, namely, 1. Resonance absorption, 2. Density profile modification, 3. Parametric instabilities, 4. Nonthermal hot electron production, 5. Main body heating, 6. Magnetic field generation, 7. second harmonic generation. B. Instabilities in an underdense plasma, including both the absorptive instability occurring at the quarter critical layer (two plasmon decay) and the reflective instabilities, namely, 1. Stimulated Brillouin scattering and 2. Stimulated Raman scattering. C. Self focussing instabilities, which occur when intense microwave or laser beams are propagated through plasmas.

4.0012, MAGNETIC FIELD INTERACTIONS WITH MATERIAL DISCONTINUITIES 13279-MS

W. Lord, Colorado State University, School of Engineering, Dept. of Electrical Engineering, *Fort Collins, Colorado* 80523 (DA0E9194; DAAG29 76 G0249)

To model the interaction of magnetic fields with material discontinuities using finite element analysis techniques. Relevance -the research is relevant to nondestructive evaluation of steels used in such components as gun tubes, munitions, pipe, aircraft etc. To detect inclusions voids and cracks. It is also relevant to the design of magnetic ordinance and communication devices where geometry and spatial distribution of magnetic fields are important. The computer codes to be generated as a result of the research will be made available to Army scientists, and this is relevant to processing of data in various R and D programs in Army laboratories.

The program will include development of magnetic leakage field profiles for a variety of surface and subsurface defects in an axially magnnetized ferromagnetic bar; measurement of magnetic leakage fields around actual defects using hall plates, and comparison of results with theory; and extension of models to include residual forms of magnetization and study of the feasibility of using finite element analysis to model eddy current interactions with material discontinuities.

SUPPORTED BY U.S. Dept. of Defense, Army Materiel Development & Readiness Command, Army Research Office

4.0013, DEVELOP A NAVIER-STOKES ANALYSIS FOR THE AFT-END FLOW FIELD OF AERODYNAMIC VEHICLES 15905-E

H. McDonald, Scientific Research Associates Inc., *Glastonbury, Connecticut* 06033 (DA0G8961; DAAG29-79-C-0003)

To develop a Navier-Stokes solution for the viscous elliptic portion of jet plume interaction flow fields in the vicinity of an axisymmetric base. Relevance - the research is directly relevant to the improved design of Army missiles, rockets and projectiles.

A local flow field Navier-Stokes analysis including flow both upstream of the base where a shock wave-boundary layer interaction may occur on a boat-tail and downstream of the base where recirculation may be present will be carried out. This detailed solution then would be joined either to inviscid solutions or viscous parabolic solutions in an interactive manner to determine the entire flow field.

SUPPORTED BY U.S. Dept. of Defense, Army Materiel Development & Readiness Command, Army Research Office

4.0014, STRUCTURE OF AUTOMATIC CONTROL SYSTEMS

A.S. Morse, Yale University, School of Engineering, Dept. of Engineering & Applied Science, *206 Elm, New Haven, Connecticut* 06520 (DF046570; AFOSR-77-3176)

AF function - the design of aerospace and turbojet control systems. Deficiency - the control process is still poorly understood for nonlinear and time-varying systems. Objective - the objective of this research program is to develop concrete analysis and synthesis methods for dealing with the engineering problems encountered in the design of complex control and information systems. How work contributes - this work would provide new aspects from which to analyze the control design problem.

Research will be made in a number of important design problems associated with the identification and control of linear multivariable systems. Included will be the continuation of a fundamental study of self-tuning systems with the objective of developing effective techniques for designing such systems so that they function reliably over a reasonable range of process operating conditions - the study is motivated, in part, by the control requirements of proposed, high performance turbojet engines. A study will be made of the basic properties of nonlinear dynamical systems with input-output maps admitting finite Volterra series expansions. An effort will be made to develop systematic procedures for constructing realizations directly from multivariable transfer function data and for designing practical feedback controllers for such systems.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Office of Scientific Research

4.0015, PROBING OF TRANSONIC BOUNDARY LAYERS 15172-E

J.E. Danberg, University of Delaware, School of Engineering, Dept. of Mechanical & Aerospace Engineering, *Newark, Delaware* 19711 (DA0F9168; DAAG29-78-G-0057)

To probe the boundary layer on spinning and non-spinning projectiles with the aim of developing physical insight into the reasons for the observed strong variations in pitching moment and magnus force and moments at transonic speeds. Relevance - the proposed investigation is directed toward obtaining a physical understanding of large pitching moment variations observed at transonic speeds on several of the Army's projectiles being evaluated by BRL. Consequently, the research is directly relevant to performance prediction and development of stable long range gun-launched projectiles.

Pilot probing of the flow field will be one of the main techniques used to obtain new information on the state of the boundary layer on the projectile afterbody. The measurement technique will be verified for certain flow conditions and will then be applied to realistic boat-tails.

4.0016, EIGENVALUE/EIGENVECTOR ASSIGNMENT IN LINEAR SYSTEMS

A.K. Choudhury, Howard University, School of Engineering, Dept. of Electrical Engineering, *2400 6th St. N.W., Washington, District of Columbia* 20001 (NSG 7624)

SUPPORTED BY U.S. National Aeronautics & Space Admin., Office of Aeronautics & Space Technology

4.0017, NOISE SUPPRESSION IN JET INLETS

B.T. Zinn, Georgia Inst. of Technology, School of Engineering, Dept. of Aerospace Engineering, *225 North Ave. N.W., Atlanta, Georgia* 30332 (DF047490; F49620-77-C-0066)

AF function - improved aerospace vehicles. Opportunity - reduce noise levels produced by air-breathing engine-inlet configurations. Objective - develop and experimentally verify an analytical technique for predicting the far field radiated noise taking variable noise source characteristics, duct absorption properties and inlet geometries into consideration. How work contributes - a better understanding of the coupling mechanisms of the noise generated in the engine inlet ducting (fans and compressor noise) with the far field radiated noise is required. Also, methods for evaluating the effects of various duct wall acoustic treatments and engine-inlet configurations are needed. Full success of this effort will allow the accurate prediction of the far field noise levels of an engine-inlet and changes to this level due to inlet duct treatment or inlet geometry without the costly cut and dry full-scale testing required at present.

An integral formulation of the Hemholtz equation will be developed, discretized and solved numerically. This formulation will couple the sound source with the radiated far field and will account for changes in the far field due to inlet geometry and wall acoustic liner treatments. Experimental data will be obtained of the radiated sound field from several simple inlet configurations to evaluate the theoretical predictions.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Office of Scientific Research

4.0018, INTERNAL AND EXTERNAL BALLISTICS OF MISSILES WITH SPECIAL CONSIDERATION OF JET PLUMES INTERFERENCE EFFECTS DURING LAUNCH AND FREE FLIGHT PH

H.H. Korst, University of Illinois, Urbana Champaign Campus, School of Engineering, Dept. of Mechanical & Industrial Engineering, *207 Engineering Hall, Urbana, Illinois* 61801 (DA0E9089; DAAG29 76 G0209)

To conduct a comprehensive research program dealing with aerodynamic interference problems encountered during various phases of in-tube propulsive burning and ballistic flight trajectory of rockets. This research is directly relevant to the problem of estimating jet plume effects on performance, stability and control of high acceleration rockets and missiles. Such problems have been identified as high priority advanced technology areas in the MICOM missile plan. In addition, it is relevant to the research activities at BRL in launch and transitional ballistics.

This program shall include theoretical analysis, computer program development, mathematical modeling, and selected experimentation aimed at establishing the merits of analytical and modeling concepts for jet plume-launcher wall interference, blow-back at breach, muzzle blast, and jet plume-slipstream interference.

SUPPORTED BY U.S. Dept. of Defense, Army Materiel Development & Readiness Command, Army Research Office

4.0019, A FUNDAMENTAL STUDY OF A NEW FABRICATION TECHNIQUE FOR FIBER REINFORCED ALUMINUM MATRIX COMPOSITES 13847-MS

R. Mehrabian, University of Illinois, Urbana Champaign Campus, School of Engineering, Dept. of Mechanical Engineering, *207 Engineering Hall, Urbana, Illinois* 61801 (DA0E9048; DAAG29-78-G-0067)

To sutdy the fundamental parameters of a new processing technique, consisting of incorporating discontinuous fibers into a partially solidified alloy before casting, for fabrication of metal matrix composites. The research is relevant to the fabrication of fiber reinforced, metal matrix composites for Army applications, such as lightweight portable bridges, transmission housings for helicopters, and structural bulkheads for ground vehicles (armored personnel carrier). There is a potential application for the hubs for the super flywheel project at MERDC.

The program will include (1) determination of the effect of processing parameters on microstructure, interphase interface characteristics, wetting of the fiber by the matrix and mechanical properties of the composite, (2) determination of the effect of composite composition (fiber type, matrix alloy, volume fraction of fibers) and internal structure (fiber length, distribution, alignment, and orientation) on the mechanical properties of the composite, and (3) development of models to describe the reactions at the fiber-matrix interface.

SUPPORTED BY U.S. Dept. of Defense, Army Materiel Development & Readiness Command, Army Research Office

4.0020, PSEUDOMEASURES - CHARACTERIZATION OF THE BASIC SIGNAL PROCESSING CAPABILITIES OF DIGITAL AND SAMPLED DATA SYSTEMS

R.J. Leake, University of Notre Dame, School of Engineering, Dept. of Electrical Engineering, *Notre Dame, Indiana* 46556 (DF044050; AFOSR-76-3036)

AF function - to advance the theory and application of digital signal processing, filtering, estimation, and detection, which are so important in communications, sensors, and surveillance systems. Deficiency - although the many advantages of digital circuitry are well established, the implementation of the technology

is often much too expensive for the expected return. Objective - to extend the theory of sampled digital systems to better understand quantized data-processing, digital controllers, and other concepts that were so important in classical circuit theory. How work contributes - success in this research would result in improved and more economical military electronic systems.

The theory of generalized functions, which includes Fourier analysis of more general functions that the classical theory, will be used as a tool to extend the important sampling theorem of Shannon, and to study the stability properties of digital filters and control devices. A new concept on quantizers is also to be perfected that will include the various devices now in use and which will permit the evaluation and analysis of quantized digital filters in a more accurate manner than has been possible heretofore.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Office of Scientific Research

4.0021, A SYSTEM STUDY FOR THE APPLICATION OF DISTRIBUTED PROCESSORS TO FLIGHT TESTING TECHNIQUES

G.L. Kelley, University of Kansas, Lawrence Campus, School of Engineering, Dept. of Electrical Engineering, *Learned Hall, Lawrence, Kansas* 66044 (NSG 4026)

SUPPORTED BY U.S. National Aeronautics & Space Admin., Dryden Flight Research Center

4.0022, DRAG REDUCTION/DELIVERY TRUCK

V.U. Muirhead, University of Kansas, Lawrence Campus, School of Engineering, Dept. of Aerospace Engineering, *Learned Hall, Lawrence, Kansas* 66044 (NSG 4023)

SUPPORTED BY U.S. National Aeronautics & Space Admin., Ames Research Center

4.0023, EVALUATION OF AIRCRAFT SEPARATION ASSURANCE CONCEPTS, DISPLAYS AND AVIONICS EQUIPMENT

Unknown, Arnic Research Corp., *Annapolis, Maryland* 21401 (FA78WA-4091; FA161204 (TRAIS NO.))

The contractor shall furnish all of the personnel, materials, services, equipment and facilities for evaluation of pilot performance and commercial aircraft operation when operating with Aircraft Separation Assurance (ASA) avionics, This program will be structured in two parts: (1) simulation; and (2) preparation for operational testing.

SUPPORTED BY U.S. Dept. of Transportation, Federal Aviation Admin.

4.0024, EFFECTS OF SHOCK LOADING VARIABLES ON SHOCK-WAVE STRENGTHENING OF METALS 13183-MS

D.E. Mikkola, Michigan Technological University, School of Engineering, Dept. of Metallurgical Engineering, *Houghton, Michigan* 49931 (DA0T5573; DAAG29-78-G-0005)

To determine the effects of shock loading variables upon the microstructure and properties of materials and to make a detailed comparison of laser-induced shock wave effects with those associated with mechanically introduced shock waves. Relevance - the proposed research has relevancy to hypervelocity impact research on projectiles and armor, and to the laser effects on materials as described in the Army's laser hardened materials and structures plan (1974).

Detailed studies will be made of the microstructural and substructural effects caused by changes in pulse duration during shock loading of metallic alloys, a quantitative examination of the relationship between structure and properties of shock-loaded materials, and will include studies of how various time-dependent flow mechanisms partake in the deformation process. Both laser shocking and mechanical shocking studies would be performed.

SUPPORTED BY U.S. Dept. of Defense, Army Materiel Development & Readiness Command, Army Research Office

4.0025, LASER DIAGNOSTICS OF METALLIC PLASMAS

D.R. Bach, University of Michigan, Ann Arbor Campus, School of Engineering, Dept. of Nuclear Engineering, *Ann Arbor, Michigan* 48104 (DF039640; AFOSR-74-2713)

AF function - operation of high altitude vehicles in a post nuclear explosion environment, development of electromagnetic weapons, space and ionospheric communications as well as countermeasures demand advanced equipment unavailable to date. Deficiency - present day information is inadequate to design the aforementioned equipment. Such information may be obtained from experimental and theoretical work in metallic (collisional) plasmas. Objective - this project will investigate experimentally various laser diagnostic methods on high density metallic plasmas. Both exploding wires and Z pinch plasmas will be investigated, specifically aluminum and tungsten wires. Contribution - this work is a part of a comprehensive program on plasma research for the development of an x-ray radiation source for simulation of nuclear weapon effects, the development of advanced electromagnetic weapons (laser and ion beam), the development of space and ionospheric communications and the development of countermeasures.

This project will use the information obtained from lithium exploded wire plasmas to extend it to higher Z wire plasmas of aluminum and tungsten in the investigation of low energy x-ray emission from the plasma. These x-ray emission measurements will be compared with the calculations of Drs. Ong and Duderstadt (AFOSR grant 76-2904). The explosion wire system will be rebuilt in such a way that the plasma can be heated in the radial direction by using the high intensity CO2 laser in the axial direction in order to simplify the geometry to perform better comparisons between the calculations and experiments. Attempts will also be made to determine the geometrical shape of the x-ray emitting regions using x-ray pinhole photography.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Office of Scientific Research

4.0026, AERODYNAMIC AND ELECTROMAGNETIC PROPERTIES OF PLASMAS

L. Cesari, University of Michigan, Ann Arbor Campus, School of Literature Science & the Arts, Dept. of Mathematics, *Ann Arbor, Michigan* 48104 (DF046970; AFOSR-77-3211)

AF function - design of advanced aerospace vehicles. Deficiency -more critical design criteria requires more exact evaluation involving additional physical effects. Objective - increased understanding of satellite environment and structure. How work contributes - by developing solution techniques for problems in shock waves in fluids and plasmas, chemical reaction and diffusion, optical resonance, nonlinear elastic deformation and buckling, etc.

At present nonlinear problems are to a large extent treated individually although subclasses of such problems, their properties and their solution techniques are being characterized. Theoretical and numerical AF relevant examples in bifurcation aspects of three-dimensional viscous fluid flow - plasma, optical, water, and atmospheric waves and shock waves - reaction diffusion systems, nonlinear elasticity and buckling, etc., chosen for their importance in the development of a general theory, will be investigated.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Office of Scientific Research

4.0027, SIMPLIFIED INERTIAL GUIDANCE DEMONSTRATION (SIG-D)

J.P. Laughlin, Vought Corp., Michigan Division, *P.O. Box 909, Sterling Heights, Michigan* 48077 (DA0F1235; DAAK40 76 C 0669)

The technical objective is to design, manufacture, test and deliver three flight demonstration missile airframes with pneumatic controls to be utilized as flight demonstration vehicles to test low cost strapdown guidance techniques.

The airframe will use solid propellant motors manufactured during the Greener Pastures Program, empty Lance E-11 warheads for the nose section, and modified midsection for guidance system mounting. Aft-mounted pneumatic controls using four elevons for control will be developed. Midship wings and aft

tail/elevon surfaces are being designed based on wind tunnel tests. The government will integrate a ring laser gyro strapdown inertial guidance system into the airframe for feasibility demonstration flight testing.

4.0028, ELECTRON LITHOGRAPHY STAR DESIGN GUIDELINES

W.H. Causey, Mississippi State University, School of Engineering, Dept. of Electrical Engineering, *Suite 101 Engineering Bldg., Mississippi State, Mississippi* 39762 (NAS 8-33450)

SUPPORTED BY U.S. National Aeronautics & Space Admin., Marshall Space Flight Center

4.0029, DEVELOPMENT OF PARTIAL CHANNEL FLOW FOR ARBITRARY INPUT VELOCITY DISTRIBUTIONS USING BOUNDARY-FITTED COORDINATE SYSTEMS 13675-EX

L.R. Hester, Mississippi State University, School of Engineering, Dept. of Aerospace Engineering, *Suite 101 Engineering Bldg., Mississippi State, Mississippi* 39762 (DA0E9022; DAAG29 76 G0144)

To develop numerical solutions for time-dependent, two-dimensional incompressible laminar partial channel flow. This investigation is directly relevant to research on fluidic devices, utilized for example in such Army applications as helicopter and tank stabilization systems, being conducted at HDL and impacts on the techniques for modeling of flows in rivers, estuaries, and coastal seas being carried out at Waterways Experiment Station.

A numerically generated curvilinear coordinate system having a coordinate line coincident with the boundary contour will be utilized for solving the Navier-Stokes equations of viscous fluid mechanics describing flows through arbitrarily shaped channels.

SUPPORTED BY U.S. Dept. of Defense, Army Materiel Development & Readiness Command, Army Research Office

4.0030, PROCESSING MECHANISMS, STRUCTURE, AND MORPHOLOGY OF HIGH-TEMPERATURE POLYMERIC ALLOYS

I.L. Hay, Celanese Corp., *Box 1000 Morris Ct., Summit, New Jersey* 07901 (DF047260; F49620-77-C-0046)

AF function - advanced Air Force lightweight aircraft, missile and satellite systems will utilize structural matrices and adhesives which will provide high performance at elevated temperatures in extreme service environments. Deficiency - the most stable polymer systems are relatively intractable and difficult to process by current fabrication techniques. Objective - the principles and mechanisms underlying the alloying of intractable, high-temperature polymers will be investigated. How work contributes - it is expected that this research will yield combinations of polymers that are more readily fabricable and have high temperature properties similar to the major intractable components.

Research will center on (1) the processibility of intractable polymers when alloyed with compatible polymers and monomers, (2) correlation of the particulate form and character of polymer mixtures before hot pressing with physical and mechanical properties after consolidation, and (3) the assessment and utilization of various experimental techniques to characterize the chemical and physical interactions occurring during processing and to establish the chemical nature of the polymer alloys.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Office of Scientific Research

4.0031, STUDIES OF SLENDER, AXIALLY SYMMETRIC BODIES AT INCIDENCE AT HIGH REYNOLDS NUMBERS 14254-E

S.M. Bogdonoff, Princeton University, Graduate School, *205 Nassau Hall, Princeton, New Jersey* 08540 (DA0F9113; DAAG29-77-G-0234)

To experimentally investigate the flow field about two axisymmetric configurations, a tangent Ogive-cylinder and a secant Ogive-cylinder, at low incidence using a high Reynolds number supersonic wind tunnel. Relevance - experimentally obtained data for three-dimensional turbulent boundary layers on axisymmetric bodies at incidence is urgently needed for verification of recent theoretical developments at BRL. Such data would be quite useful in validating theories for design of Army missiles and projectiles.

Both surface and flow field measurements will first be made on a tangent Ogive-cylinder model at Mach 3 and a Reynolds number of approximately 1.6 million per inch, at incidence angles of 2 degrees and 4 degrees. Measurements will be made at 30 degree increments of Azimuth angle at 4, 5, and 6 diameters from the model tip and similar measurements will then be made for a second nose geometry.

SUPPORTED BY U.S. Dept. of Defense, Army Materiel Development & Readiness Command, Army Research Office

4.0032, NONLINEAR PROCESSES IN PLASMAS

R.M. Kulsrud, Princeton University, School of Engineering & Applied Sciences, Dept. of Astrophysical Sciences, *Box 430, Princeton, New Jersey* 08540 (DF040390; F44620-75-C-0037)

AF function - operation of high altitude vehicles in a post nuclear explosion environment, development of electromagnetic weapons, space and ionospheric communications as well as countermeasures demand the fundamental understanding of the nonlinear evolution of energy transformations in plasmas. Deficiency - the aforementioned information required for the design of advanced equipment is not available today. Its acquisition may be realized by a well planned theoretical and experimental research program. Objective - this program will investigate nonlinear collective phenomena, such as anomalous transport phenomena, linear wave absorption, and plasma wave turbulence, both in the laboratory and in space. Contribution - this work is a part of a comprehensive program of plasma research for the development of an x-ray radiation source for simulation of nuclear weapon effects, the development of advanced electromagnetic weapons (laser and particle beam), the development of space and ionospheric communications and the development of countermeasures.

This project will perform theoretical calculations, analyze, evaluate and correlate the available experimental results of laser plasma interactions, solar wind plasmas, ionospheric plasmas, acceleration processes and runaway electron plasmas. Specifically it will investigate (a) the problem when 'islands' in plasmas appear in two forms, either as magnetic 'islands' in configuration space, or as 'islands' of near resonance in phase space. The islands may be sporadic but their presence causes rapid diffusion, (b) the nonlinear evoluation of the tearing instability made with specific reference to the development of magnetic island structures and to move violent processes such as disruptive instabilities and rapid magnetic reconnection, (c) various types of solitary wave structures which develop in the very large amplitude turbulence associated with rapid heating methods in laser interactions, (d) it will also develop numerical techniques for elucidating the properties of runaway electron discharges and the instabilities observed in laboratory situations and (e) it will continue the study of electron density striations in the ionosphere and their relation to communication problems.

4.0034, PROPOSAL TO VERIFY ROCKET EXHAUST PLUME EFFECT SIMULATION TECHNIQUES 13797-E
C.F. Reid, Calspan Corp., *1422 Genesses Ave., P.O. Box 235, Buffalo, New York* 14221 (DA0F8934; DAAG29 77 C 0008)

To investigate the validity of a cold jet simulation of rocket exhaust plume effects by direct experimental comparison between hot and cold jet base and afterbody pressures and between calculated pressures based on cold jet modeling and measured hot jet pressures. Relevance -the research is directly relevant to the understanding of plume effects on missile aerodynamics which is important because of the possible adverse effects of plumes and because of the potential for improving the accuracy of free rockets. Such technology is one of the principal thrusts of the aeroballistics directorate at MICOM.

Base and afterbody pressure measurements and Schlieren photographs of the plume from a solid fuel rocket engine will be made and used for comparison with an analytical model based on cold jet simulation of the hot jet and with cold jet experimental measurements of similar quantities.

SUPPORTED BY U.S. Dept. of Defense, Army Materiel Development & Readiness Command, Army Research Office

4.0035, INVESTIGATION OF MOLECULAR BEAM EPITAXIAL GROWTH OF COMPOUND SEMICONDUCTORS AND CONTACTS 15479-EL
L.F. Eastman, Cornell University, Ithaca Campus, School of Engineering, Dept. of Electrical Engineering, *242 Carpenter Hall, Ithaca, New York* 14853 (DA0G8960; DAAG29-79-G-0036)

To advance the state of the art in compound semiconductor layers, Schottky barriers and ohmic contacts for electron devices. Relevance -this research will directly support an active program at ERADCOM/ETDL to improve materials technology for very high speed integrated circuits. Close cooperation between this principal investigator and ETDL has already been established.

To use molecular beam epitaxy (MBE) to grow bulk and layered structures. Characterize and analyze grown materials for metallurgical and electrical properties in order to improve quality needed for device application.

4.0037, BASIC TECHNOLOGY OF SQUEEZE-FILM DAMPERS FOR ROTOR-DYNAMICS CONTROL 15657-E
C.H. Pan, Shaker Research Corp., *Northway 10 Executive Pk., Ballston Lake, New York* 12019 (DA0F9245; DAAG29-78-C-0027)

To study and analyze the squeeze-film damper as a means of stabilizing rotor shafts and reducing vibration and shock excitation. Relevance - dampers of the type studied are needed to control vibration of rotors.

To perform an analytic formulation and solution of the system, including cavitation; and verify the solution experimentally.

SUPPORTED BY U.S. Dept. of Defense, Army Materiel Development & Readiness Command, Army Research Office

4.0038, LASER-INDUCED FLUORESCENCE 12211-P
R. George, Duke University, School of Engineering, Dept. of Electrical Engineering, *Durham, North Carolina* 27706 (DA0D9232; DAHC04-74-G-0067)

Investigation of fundamental parameters associated with the use of laser-induced fluorescense in remote sensing. This program is related to the use of laser-induced fluorescence techniques to spoof camouflaged material in reconnaisance applications.

The preliminary investigations will involve assembling a basic facility for evaluating the optimum wavelengths for excitation of various target materials. Parameters to be studied will include those associated with the laser transmitter, the target material, and the detector.

SUPPORTED BY U.S. Dept. of Defense, Army Materiel Development & Readiness Command, Army Research Office

4.0039, INVESTIGATION OF D-REGION BACKSCATTERING PROCESSES 11054-GS
W.A. Flood, University of North Carolina, North Carolina State University, School of Engineering, Dept. of Electrical Engineering, *Raleigh, North Carolina* 27607 (DA0D9299; DAAG29 76 G0138)

To conduct a comprehensive investigation of the accuracies of ground-base radio techniques for sounding the motions and electron densities in the ionospheric D-region between 6 km and 110 km. Upper air winds affect rocketry (BRL, MICOM, ASL) and ionospheric drifts affect communications (e.g., VLF communications program). This ground-based technique for wind measurement in the 60-110 km interval could replace the wind measurements of the cooperative meteorological rocket network with obvious advantages.

Specific studies include A) assessment of the validity of the randomly phased angular spectrum approximaton as it applies to HF radio wave ionospheric drift measurements, B) determination of the amplitude and distribution of D-region echoes as a function of altitude and pulse length, C) investigation of the presence and cause of orthogonally polarized D-region echoes, and D) determination of the cone angle of arrival of D-region echoes and correlation of the cone angle measurements with the orthogonally polarized D-region echoes.

4.0042, APPLICATIONS OF BOUND AND MODE APPROXIMATION TECHNIQUES FOR LARGE DEFLECTIONS OF PULSE LOADED STRUCTURES 15427-E
P.S. Symonds, Brown University, Graduate School, Dept. of Engineering, *University Hall, Box 1883, Providence, Rhode Island* 02912 (DA0F9201; DAAG29-78-G-0085)

To find methods for estimating large plastic deflections due to pulse or impact loading of engineering structures. Relevance - Army structures such as components of helicopters, vehicles, etc. are subject to large strains resulting from impulse loading. Improved methods of analysis would be useful to designers of such equipment.

Two methods of approximation will be used: (1) bound, and (2) mode. The former replaces the dynamic problem by a static one, and energy theorems are used to obtain bounds on the solu-

tions. The latter depends on the development of the solution in terms of instantaneous modes or shape functions obtained from the governing equations.

4.0046, AN ANALYTICAL STUDY OF POWERED MISSILE AERODYNAMIC PERFORMANCE 14966-A-E

J.M. Wu, University of Tennessee, Knoxville Campus, School of Engineering, Dept. of Mechanical & Aerospace Engineering, *W. Cumberland Ave. S.W., Knoxville, Tennessee* 37916 (DA0F8972; DAAG29 77 G0108)

To develop calculation techniques as well as a basic phenomenological understanding that allows the aerodynamic characteristics of realistic missile configurations to be estimated and optimized. Relevance - the understanding and prediction of the aerodynamics of canard-body-fin configurations at angle of attack is of greatest relevancy to the design and development of high performance tactical missiles and therefore has great impact on the Army's need for greater firepower.

Utilizing existing potential flow analyses, viscous flow past missiles at angles of attack will be determined including the effects of fins, fin tips and wake interactions. The resulting model will be utilized to examine aerodynamics of canard-fin-elevon combinations including effects of blunt noses and small geometric imperfections.

SUPPORTED BY U.S. Dept. of Defense, Army Materiel Development & Readiness Command, Army Research Office

4.0047, ROBUST PARAMETER ESTIMATORS FOR COMMUNICATION DATA

P. Papantoni Kazakos, Rice University, School of Engineering, Dept. of Electrical Engineering, *6100 Main St., Houston, Texas* 77001 (DF046340; AFOSR-77-3156)

AF function - radio multi-access communications, remote sensing, image encoding schemes and radar signature recognition. Deficiency -improvements are needed in the techniques of signal estimation and image processing in the presence of unpredicted interferences and abrupt changes. Objective - develop estimators that are 'robust' in the presence of statistically 'contaminated' communication data. How work contributes - this research will allow for better design of communication systems and signal processing techniques.

A big percentage of the communication channels in the literature have been modeled as Gaussian and additive, in the term 'channel' one incorporates all disturbances and measurement errors that are undesirable and which one must get rid of. The main reason for the Gaussian and additive assumptions in modeling is analytical simplicity. However, communication channels are often subject to abrupt changes. Therefore, realistically speaking, even when the channel can be modeled successfully as additive, one almost never has a very accurate knowledge of the true underlying distribution. Taking this under consideration together with the fact that the performance of some of the classical parametric tests or estimates for some information retrieval is very unstable under small changes of the underlying distribution, the need for study and design of receivers (or estimators) insensitive to such changes becomes evident. This need has been recognized by statisticians and engineers, and that is how the nonparametric and robust concepts were created. However, although tests with small sensitivity to distribution changes have been proposed and analyzed, the area is far from being exhausted. Indeed, the nonparametric property has been treated separately from the concept of robustness, although they should be connected. The subject of this proposal is the design of estimators that are 'robust' in the presence of statistically 'contaminated' communication data. A radical approach to the concept of robustness is used. A precise detailed definition of statistical contamination is given. Such definition is very sensitive to the distance between probability measures that are used. Robustness is defined as a stability property inside certain contaminated families. Constructive analysis of robustness as defined above leads to methods for designing 'robust' estimators where the concept is not vague any more.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Office of Scientific Research

4.0048, SPREAD SPECTRUM MULTIPLE ACCESS TECHNIQUES AND MICROWAVE MOBILE RADIO COMMUNICATIONS

S.C. Gupta, Southern Methodist University, School of Engineering & Applied Sciences, Dept. of Electrical Engineering, *Hillcrest & University, Dallas, Texas* 75222 (DF048010; AFOSR-77-3277)

AF function - the interference rejection and inherent message privacy properties of spread spectrum communications is of great significance to military communications as it provides a large measure of protection from active countermeasures by an enemy. Opportunity -current spread spectrum systems are too costly to be incorporated into the tactical air forces. Objective - the proposed research will investigate new spread spectrum concepts for advanced communication systems and explore the applications of these concepts to practical systems, including microwave mobile communications and military satellite communications. How work contributes - this effort will advance spread spectrum techniques for military communications.

Further simulation work will be performed to establish the practical limits on the new acquisition technique that was developed which employs an autoregressive parametric model and a variable wave digital filter. A comprehensive mathematical analysis will be performed on a spread spectrum multiple access technique for satellite communications. Finally, the problem of data transmission, at microwave frequencies, over mobile radio channels will be studied. The use of spread spectrum systems will be investigated and compared to conventional systems. Various modulation and encoding schemes will be comparatively evalu-

ated to determine the data rates that can be supported over mobile radio channels in very hostile propagation environments.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Office of Scientific Research

4.0049, DESIGN STUDIES FOR A TECHNOLOGY ASSESSMENT RECEIVER FOR THE GLOBAL POSITIONING SYSTEM

J.H. Painter, Texas A & M University, College Station Campus, School of Engineering, Dept. of Electrical Engineering, *P.O. Box F E 44, College Station, Texas* 77843 (NSG 1639)

SUPPORTED BY U.S. National Aeronautics & Space Admin., Langley Research Center

4.0050, DENSE PLASMA HEATING AND RADIATION GENERATION

M. Kristiansen, Texas Tech University, School of Engineering, Dept. of Electrical Engineering, *P.O. Box 4340, Lubbock, Texas* 79409 (DF038180; AFOSR-74-2639)

AF function - operation of high latitude vehicles in a post nuclear explosion environment, development of electromagnetic weapons, space and ionospheric communications as well as countermeasures demand the fundamental understanding of dense plasma heating and radiation generation processes. Deficiency - the aforementioned information required for the design of advanced equipment is not available today. Its acquisition may be realized by a well planned theoretical and experimental research program. Objective - this project will perform theoretical and experimental investigations on (A) CO2 laser interaction with preformed plasmas, and (B) nonlinear optical mixing in plasmas. Contribution - this work is a part of a comprehensive program of plasma research for the development of an x-ray radiation source for simulation of nuclear weapon effects, the development of advanced electromagnetic weapons (laser and particle beam), the development of space and ionospheric communications and the development of countermeasures.

This research will investigate dense plasma heating and radiation generation. This will follow two main routes: (A) CO2 laser interaction with preformed plasmas employing the laser obtained from AFWL coupled with an intracavity to enhance laser absorption. For diagnostics of the new plasma source they will use Twymann-Green and Mach-Zehnder interferometers, fast photography, spectroscopy, and diamagnetic loops. They may also use Thomson scattering. In addition to hydrogen they will use high Z materials to enhance the x-ray generation. (B) Non-linear optical mixing in plasmas will be performed by the two counterstreaming laser beams which are expected to heat the plasma by inverse bremsstrahlung. One of the most important goals of the experimental investigation is to determine the threshold for exciting various plasma instabilities that can either absorb the laser energy or scatter it out of the interaction volume. The required power densities for the onset of various possible nonlinear mechanisms is rather large. They will start a theoretical investigation of heating to determine if waves other than the Langmuir plasma wave might be more suitable to be driven by the laser beat frequency. They will use the operator formulation (Markuvitz) to calculate the excitation coefficients of various waves that might fall in the appropriate range. (Text Abridged)

SUPPORTED BY U.S. Dept. of Defense, Air Force, Office of Scientific Research

4.0051, HIGH INTENSITY SOUND

D.T. Blackstock, University of Texas, Austin Campus, School of Engineering, Dept. of Mechanical Engineering, *200 W. 21st, Austin, Texas* 78712 (DF042700; F44620-76-C-0040)

AF function - advanced aerospace vehicles. Deficiency - lack of basic understanding of nonlinear sound waves. Objective - achieve a fundamental understanding of the behavior of finite-amplitude (i.e. very intense) acoustic waves and apply this understanding to important problems of defense technology. How work contributes - major sources of nonlinear waves under investigation are jet and rocket engines. Understanding of this phenomenon and how the frequency spectrum changes with distance will enable the Air Force to remove or a least lower the noise level found around aircraft and air fields.

Research in high intensity sound will be carried out in three areas: 1) propagation of finite-amplitude noise; 2) propagation of periodic waves; and 3) diffraction, reflection, and focusing of N waves. This will be a combined theoretical and experimental program.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Office of Scientific Research

4.0052, SUBSONIC AERODYNAMIC LOADS ON MISSILES 13164-E

A.H. Nayfeh, Virginia Polytechnic Inst. & State University, School of Engineering, Dept. of Engineering Mechanics, *Blacksburg, Virginia* 24061 (DA0Q5576; DAAG29 76 G0034)

To utilize discrete-vortex techniques to treat the subsonic aerodynamic interactions between the components of missile-like configurations. The design programs at MICOM for most missiles and rockets would benefit from this research program. Two major thrust areas, free flight rocket program and terminal homing program, would be particularly benefitted. At BRL, the proposed work would be applicable to the flow about the tail fins of low velocity mortars.

The discrete-vortex technique will be extended to interactions of wings having arbitrary planforms, positions, and orientation as well as to wing-body interactions. Quantitative comparisons with experimental data will determine the accuracy of the predicted interactions effects.

SUPPORTED BY U.S. Dept. of Defense, Army Materiel Development & Readiness Command, Army Research Office

4.0053, UNSTEADY AIRLOADS ON A SINUSOIDALLY OSCILLATING SUPERCRITICAL AIRFOIL

H. Tijdeman, National Aerospace Lab., *Amsterdam, Netherlands* (DF048340; AFOSR-77-3297)

AF function - aerospace vehicles. Deficiency - there is a lack of reliable experimental unsteady aerodynamic data at transonic speeds. These data are required for analysis and for validation of unsteady transonic aerodynamic theories. Objective - to obtain accurate unsteady aerodynamic measurements at transonic speeds on two-dimensional airfoils. Unsteady wall effects will also be investigated. How work contributes - unsteady transonic aerodynamic data are required for evaluation of flutter characteristics of aircraft, flutter characteristics of helicopter rotor blades, gust response of aircraft, performance of helicopter rotor blades, and design of active control systems. The acquisition of accurate unsteady aerodynamic data in which the effects of model scale and facility wall configurations will be evaluated should serve as a standard for the comparison and evaluation of the new generation of calculation methods for unsteady transonic flow.

This is a collaborative program between NASA Ames and the NLR (which has requested nominal Air Force support for their portion of the program). The NLR 7301 airfoil will be investigated in both the NLR transonic tunnel and the NASA Ames 11 by 11 foot transonic wind tunnel. Both the NLR and NASA Ames tests will investigate the amplitude and phase relationships of the pressure distribution and the resultant integrated forces over a range of Mach numbers, angles of attack, Reynolds numbers and reduced frequency. Sufficient data and details of the test facilities pertinent to evaluating wall and scale effects will also be provided as well as details of the test techniques including data acquisition and reduction procedures. It is expected that the close cooperation of the two research laboratories will result in greater progress to improve data accuracy and reliability in a shorter period of time than would be possible by each group working independently.

P.A. Strittmatter, University of Arizona, School of Liberal Arts, Dept. of Astronomy, *Tucson, Arizona* 85721 (DF248810; F19628-78-C-0058)

AF function - communications, surveillance, detection, tracking. Deficiency - severe limitation in observing fine spatial details on deep space objects. Objective - to utilize new and existing techniques used in observational stellar astronomy to assist in solving Air Force needs in the areas of satellite identification and monitoring. How research contributes - enables the Air Force to increase spatial resolution through the atmosphere by a factor of over fifty.

A data acquisition system to obtain short exposure astronomical photographs used in the technique known as 'speckle interferometry'. This system will be used to obtain test and evaluation data on both man-made space objects (satellites) and non-man-made objects (stars, asteroids and extended nebulae). These data will be used to develop and perfect data processing schemes to recover images with spatial detail approaching the best theoretically possible in the absence of atmospheric turbulence.

5.0006, QUANTITATIVE MODELS OF THE TOTAL DENSITY OF THE DISTURBED UPPER ATMOSPHERE AND THE DISTURBED MAGNETOSPHERIC MAGNETIC FIELD
W.P. Olson, McDonnell Douglas Astronautics Co., *5301 Bolsa Ave., Huntington Beach, California* 92647 (DF040430; F44620-75-C-0033)

AF function - accurate models of the earth's magnetic field and the distribution of the earth's neutral atmosphere are needed to accurately predict nuclear weapons effects in the aerospace environment. Deficiency - current models are inadequate for the precise predictions needed. Objective - models will be derived utilizing coordinate systems that will easily interface with existing computer codes. Contributions -these models will improve the accuracy of prediction of nuclear weapons effects.

Existing models of the magnetospheric magnetic field and the density of the neutral upper atmosphere will be improved so that they are useful over the full range of magnetic conditions. Input parameters to the models will be chosen such that the models be used in a predictive mode. In line with this program the following will be accomplished: 1) quantitatively determine position and strength of the three magnetospheric current systems as a function of appropriate parameters describing the variability of each current. 2) by vector integration compute for each current system its associated vector magnetic field in the magnetosphere. 3) using vector B at a grid of points develop an analytic representation for both vector B and its associated vector potential, vector A, valid at least throughout the inner magnetosphere. 4) modify the existing quiet atmospheric density program to include disturbance effects with storm time dependencies included as appropriate. 5) extend the range of the quiet atmosphere density program to an altitude of 1000 km using available data to check and verify the extension.

5.0007, TRACKING AND MONITORING OF HURRICANES BY HF SKYWAVE RADAR OVER THE GULF OF MEXICO
J.W. Maresca, S R I International, *300 Ravenswood Ave., Menlo Park, California* 94025 (DF044800; F49620-76-C-0023)

AF function - the Air Weather Service has a technical need for remote measurement of tropical cyclone parameters. Deficiency - in the early developing stages of a tropical cyclone, the center of the cyclone, as determined by satellite data, can be displaced from the surface center by as much as 100 nautical miles. At nighttime, the coarser resolution of the satellite IR sensor presents problems in locating the tropical cyclone. Objective - HF radar technology will be used for remote sensing of the sea surface conditions and surface winds in tropical cyclones. Contribution - the availability of a remote wind sensing capability with OTH radar will permit a significant reduction of the weather reconnaissance flights with little or no degradation of the present existing forecast capability. This will be a cost effective measure.

The SRI radar (OTH) will be used as an active radar. The tropical storm area will be illuminated by a beam of radio waves originating at this radar transmitting site, and the radio waves reflected (backscatter) from the storm area are detected by a highly directional antenna located at the radar receiving site. The recorded backscatter data will be analyzed to track and monitor hurricanes to determine the sea state and surface winds.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Office of Scientific Research

5.0008, VERY-LOW-FREQUENCY PROBING OF THE MAGNETOSPHERE FROM PALMER STATION, ANTARCTICA
R.A. Helliwell, Stanford University, School of Engineering, Dept. of Electrical Engineering, *Stanford, California* 94305 (DPP7682042A02)

This is a continuation of NSF Grant Number DPP76-82042.

The very-low-frequency (VLF) wave receiving system established at Palmer Station, Antarctica, during the austral summer of 1977-78 will continue to operate during 1979 and early 1980 to obtain data on natural VLF-wave activity and on the magnetospheric response to signals injected from Siple Sta-

tion, Antarctica. The data taken at Palmer Station during transmissions from Siple will support ground-to-satellite transmitting experiments during the International Magnetosphere Study now under way. VLF-direction finding experiments will also be conducted at Palmer along with observations for VLF-wave induced particle precipitation. Two scientists will visit Palmer during the austral summer of 1979-80. One of these will winter-over during 1980.

5.0009, MAGNETOSPHERE-IONOSPHERE-ATMOSPHERE INTERACTIONS
R.A. Helliwell, Stanford University, School of Engineering, Dept. of Electrical Engineering, *Stanford, California* 94305 (ATM7820967)

This grant supports the investigation of magnetosphere-ionosphere-atmosphere interactions for a two year period. The approach to be used involves both theoretical and experimental work. In the experimental area, the primary source of data will be a field program of active and passive probing of the magnetosphere-ionosphere system at Siple, Antarctica, and Roberval, Quebec, Canada. In addition, analysis of correlative data from a number of other ground-based and satellite programs will be performed. Major scientific problems to be investigated include (1) wave-induced particle precipitation and its effects on the ionosphere, (2) the origin of VLF waves in the magnetosphere, with particular emphasis on the role of man-made VLF noise in stimulating wave activity in the magnetosphere, (3) longitudinal wave-particle interactions in the magnetosphere, and (4) substorm electric fields in the plasmasphere and their effects on the ionospheric F region.

I.A. Kinsey, University of California, Berkeley Campus, Space Sciences Lab., *3 Leuschner Observatory, Berkeley, California* 94704 (DF247230; F19628-76-C-0125)

AF function - communications and detection. Deficiency - understanding ionospheric effects caused by various auroral phenomena which cause communications degradation in the Arctic. Objective -investigate the effects of the interplanetary magnetic field on various auroral phenomena. How research contributes - provides inputs to in-house work efforts in substorm prediction and ionospheric mapping. This contractual effort is for investigation of the IMF and its relationship to various auroral phenomena and the predictive indications inherent in the IMF behavior. Interpretation of IMF parameters in terms of auroral phenomenology provides a background for the interpretation of data collected by the AFCRL Airborne Ionospheric Observatory.

Assemble and interpret IMF data to specify a given ionospheric state and structures associated with the chosen state. To correlate the specific states and structures with DMSP photos and aircraft data. To identify any precursor states or structures which warn of impending substorms or other magnetic disturbances.

5.0013, ONE-TIME GRANT FOR MAJOR UPGRADING AT JICAMARCA
B.B. Balsley, U.S. Dept. of Commerce, National Oceanic & Atmospheric Admin., Environmental Research Lab., *Boulder, Colorado* 80302 (ATM78-17663)

This grant provides major upgrading of the data processing capability for aeronomical and meteorological research done at the Jicamarca Radio Observatory. The Observatory has importantly unique research capabilities by virtue of its geophysical location at the magnetic equator and its instrumental capabilities. These unique research opportunities have led to the maintenance of a long standing substantial U.S. research effort at the Observatory by a large number of first rate U.S. scientists. By replacing old worn-out units with their modern counterparts, the capability of this Observatory and the efficiency of the dependent research programs are significantly enhanced.

The improved reliability and order of magnitude increase in data handling capability provided by this grant will correspondingly enhance research in the areas of: 1) Dynamics of the Neutral Atmosphere, including measurement and analysis of winds, waves, and turbulence in troposphere, stratosphere, and mesosphere; 2) Structure and Dynamics of the Equatorial F Regions; 3) Equatorial F-Region Irregularities (Spread F) with emphasis on the explanation of the experiments at Jicamarca and which are so severe as to interfere with radio communications in the very high GHz range; and 4) Equatorial Electrojet Irregularities (Equatorial Sporadic E).

5.0027, RESEARCH LEADING TO THE DEVELOPMENT OF INSTRUMENTATION FOR RESEARCH ROCKETS SUPPORT AND INSTALLATION AT ROCKET LAUNCH SITES
S.J. Rochefort, Northeastern University, School of Engineering, Dept. of Electrical Engineering, *360 Huntington Ave., Boston, Massachusetts* 02115 (DF247220; F19628-76-C-0111)

AF function - research leading to the development of state-of-the-art airborne instrumentation systems. Deficiency - the inability to accurately forecast the atmospheric interactions affecting the design and operation of military systems in the area of rockets and satellites. Objective - to perform studies leading to the design, construction and flight test of state-of-the-art airborne instrumentation systems. Such studies will attempt to improve present day systems by more efficient utilization of transmission bandwidths. Provide field support - carry on post-flight analysis of performance and provide continuing improvement. How research contributes - the development of more efficient airborne data processing techniques and instrumentation systems will allow more efficient use of RF bandwidth within the limited allowed band.

Theoretical development of more efficient telemetry systems for use in rocket, satellite and balloon instrumentation systems. Construct these telemetry systems for flight - provide field support and carry on post-flight analysis of performance. The closed loop will ensure rapid response to current needs. The design objectives concern space, weight and power. The vast experience accumulated through previous contracts should ensure efficient use of valuable Air Force funds.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Geophysics Lab.

5.0028, ELECTRONICS FOR ULTRAVIOLET SPECTROMETER
C.G. Kuczun, Tri Con Associates Inc., *Cambridge, Massachusetts* (DF249990; F19628-77-C-0048)

AF function - vehicle tracking during flight and re-entry, trajectory prediction, communication systems. Deficiency - present atmospheric models predict only slight variability of the density of the upper atmosphere below 200 km; however, empirical data show this conclusion to be incorrect and observations indicate density changes as great as 50 percent in both space and time at altitudes between 120 and 200 km. This altitude, important for Air Force operations, will be studied on a world-wide basis by density experiments aboard the DMSP satellites. The present work will support these experiments. Objective -in-situ measurements with rockets of atmospheric parameters to provide correlative data for comparison with photometric data from DMSP satellites. How research contributes - provides direct, low-altitude measurements of pertinent atmospheric properties as an aid in understanding the remote optical measurements made from DMSP satellites.

Contractor shall design, fabricate and test an electronics subsystem for a double-deck solar EUV spectrometer and auxiliary experiments (a UV photometer, a dayglow photometer and an electron analyzer), modify ground support equipment consoles for the spectrometer and the photometers, and assist in the preparation of the rocket payload for flight. Measurements will subsequently be made from a rocket in the altitude range between 120 and 200 km. of the photoelectron flux, differential energy distribution for energies between 0 and 100 electron volts, of the radiance of nitrogen airglow at 3371 Angstroms and of the density and composition of the upper atmosphere as established by solar ultraviolet photon absorption rates.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Geophysics Lab.

5.0029, ADVANCED WEATHER RADAR DIAGNOSTIC SOFTWARE
C.L. Bjerkaas, U.S. Dept. of Defense, Air Force, Geophysics Lab., *L.G. Hanscom Field, Bedford, Massachusetts* 01731 (DF581480)

AF function - protection of aerospace systems in severe storms. Deficiency - identification and warning of storm hazard by current methods are unreliable and require ineffective utilization of projected reduced manpower. Objective - to develop software suitable for the operational detection of meteorologically significant features of storms and the prediction of storm movement, development, and severity. How development contributes - provides improved identification and prediction of convective storm hazards using automated data processing techniques for storm diagnosis.

Algorithms for detecting radar indicators of severe weather phenomena will be developed based on radar data taken in Oklahoma during the joint agency Doppler tests in the spring of 1977. The algorithms will be operationally tested during the spring 1978 test and modified based on the test results.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Geophysics Lab.

5.0030, LANDSAT STUDY OF URBAN AND LAND USE - JACKSON, MS

M. Lang, Jackson State University, School of Liberal Studies, Dept. of Social Science & Educational Geography, *1325 Lynch St., Jackson, Mississippi* 39217 (NSG 736)

5.0031, CLIMATIC MISSION SUCCESS INDICATORS

D.E. Martin, St. Louis University, School of Engineering, Dept. of Earth & Atmospheric Sciences, *3507 Laclede Ave., St. Louis, Missouri* 63103 (DF248330; F19628-77-C-0032)

AF function - support weather sensitive Air Force and Army mission. Deficiency - current climatology needs to be adapted to expeditiously meet the input requirements for indicators of mission success. Research - apply statistical theory and computer methods to the climatic record. How research contributes - will contribute to a military capability to assess the climatic influence anywhere, at any time, worldwide, upon the probabilities of the successful completion of an Air Force mission.

Develop and test stochastic models for estimating joint or conditional probabilities of weather events including events with time lag between them, all of which will be favorable for the successful completion of a multiphased Air Force mission. The weather events are those relevant at take-off, enroute and at one or more destinations and their alternates.

5.0032, STRATOSPHERIC DISCHARGES

R.E. Orville, State University of New York, Albany Campus, School of Arts & Sciences, Dept. of Atmospheric Science, *1400 Washington Ave., Albany, New York* 12222 (DF580040; F19628-78-C-0007)

AF function - environmental impact statements of high-altitude Air Force operations. Deficiency - current or anticipated AF operations in the stratosphere may deposit harmful materials and it is important to assess the potential impact of this in the context of the harmful substances deposited naturally by such things as thunderstorms. Objective - to perform an experimental study of glow discharges associated with lightning in thunderstorms but which occur above the storm in the stratosphere. How research contributes - this work would establish the existence and some of the characteristics of these discharges. Such discharges may be having a significant effect upon the chemistry of the stratosphere. They may in fact be generating large amounts of NOX there, but comparatively little is known about the phenomenon at present. The work would also be important for future aircraft operations when they have the ability to fly over thunderstorms. This is because it is possible that they may experience or even initiate clear air stratospheric discharges. A third area of relevance is that of navigation, surveillance, and communication since these can be affected by electrical activity.

The experimental program will center around an optical approach involving still and cine photographs as well as spectroscopic investigations using filters and multichannel recordings. A comparison of certain spectral lines will prove or disprove the existence of the clear air stratospheric discharges. Vehicles such as high altitude aircraft and balloons will allow detection of the phenomenon from above the thunderstorms. Both ground-based and airborne observations will be made.

To investigate the role of differential heating at the earth's surface and N-producing mesoscale circulations. This research is relevant to the Army Automated Meteorological System (AMS) requirement for development of the technology base on small-scale atmospheric processes.

Prediction of atmospheric behavior in the planetary boundary layer will be determined using a complex three-dimensional, multi-level primitive equation model modified to realistically account for vertical fluxes of heat and momentum, and a simpler two-dimensional analog to the 3-D model. The role of differential heating at the earth's surface will be stressed in this comparison.

AF function - detection. Deficiency - lack of knowledge of atmospheric processes controlling infrared and optical backgrounds. Objective - a rocketborne electron source will be designed, fabricated and tested for eventual integration in a rocket payload designed to determine specific atmospheric parameters by means of electron induced optical emissions. A rocketborne Echelle spectrometer will measure relative band intensities, band profiles and absolute band intensities of specific molecular emission excited by a rocketborne electron source. The emissions will be interpreted in terms of CO_2, O_2 and O and N_2 atmospheric densities as well as N_2 rotational and vibrational temperatures. How research contributes - the rocket payload measures a series of atmospheric parameters that control infrared

4.3 micron CO2 emission in both auroral and nuclear disturbed atmospheres. The results provide insight into the spectral, spatial and temporal nature of IR backgrounds under auroral and nuclear disturbed conditions.

A rocketborne electron source will be designed and fabricated to provide a beam of electron induced optical emissions to be observed by a rocketborne Echelle spectrometer. The spectrometer measures the molecular band profile and photon emission rate of selected molecular emissions induced by an energetic beam of electrons. The electron source energy and current and the spectrometer are designed as a compatible system with the measurement precision of the ambient atmospheric parameters the principal design criteria.

5.0039, DYNAMICS OF THE HIGH LATITUDE IONOSPHERE

W.J. Raitt, Utah Higher Education System, Utah State University, School of Science, Dept. of Physics, *Main Bldg., Office 104, Logan, Utah* 84321 (DF248300; F19628-77-C-0011)

AF function - surveillance, communication, navigation, ionosphere and magnetosphere modelling. Deficiency - inadequate knowledge of plasma flows, charge distributions, electric fields for the design needs of AF systems. Objective - study high latitude ionospheric dynamics in three areas: 1. High latitude F region dynamics, 2. Convection electrodynamics, and 3. Polar wind. How research contributes - provides data essential to HF and UHF propagation predictions, provides data required for the design and utilization of communication guidance and surveillance systems and provides understanding of the dynamical processes in the ionosphere.

Develop theoretical procedures and computer codes to determine plasma flow, particle distributions and effects of electric fields on the high latitude F region. Satellite data will be utilized to test the theoretical methods and to develop a prediction capability for the high latitude ionosphere.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Geophysics Lab.

5.0040, CLOUD AND PRECIPITATION PARTICLE SIZE SPECTRA 15420-GS

L.F. Radke, University of Washington, School of Arts & Sciences, Dept. of Atmospheric Sciences, *Seattle, Washington* 98105 (DA0G8929; DAAG29-79-G-0005)

To obtain measurements and relate liquid and solid particle size spectra in clouds and precipitation to the mesoscale structure of storms, the mechanism by which precipitation is produced, the effects of moisture supply, air motion and changes in the particle spectra produced by topography. Relevance - many E-O weapon and communication systems are sensitive to attenuation by liquid and solid particles in clouds and precipitation. Liquid and solid particle size spectra also are important in rain and ice crystal erosion, icing of aircraft, and prediction of cloudiness and precipitation.

As a subtask of a larger cycles project, use airborne and ground-based instrumentation to measure size spectra of solid and liquid cloud and precipitation particles as they move from over the Pacific Ocean into Washington State. Combine these measurements with other simultaneous measurements and observations from satellites, two instrumented aircraft, four weather radar (two Doppler), serial radiosondes, and a dense network of precipitation rate measuring gages to analyze cloud and precipitation microphysics.

5.0041, AEROSOL LIFE CYCLES AND RELATED ATMOSPHERIC PROCESSES

M.B. Baker, University of Washington, School of Engineering, Dept. of Civil Engineering, *206 Guggenheim Hall, Seattle, Washington* 98105 (ATM78-08163)

The processes by which materials are cycled through the troposphere determine their spatial and temporal distributions, as well as their physical and chemical properties. This study will perform an analytical investigation of a selected set of aerosol cycles. The optical effects of each aerosol are derived from models of the dominant cycle mechanisms. Determination of the sensitivity of these optical effects to uncertainties in the data leads to quantitative characterization of the major data requirements. The cycles are examined both from a deterministic and a stochastic point of view. Measured variability in input parameters is incorporated into models which predict the statistical properties of the time-dependent and steady-state particle concentrations. The techniques thus developed are generalized and applied to a class of mathematically similar atmospheric phenomena.

5.0042, SATELLITE OBJECTIVE FORECASTING

D.R. Johnson, University of Wisconsin, Madison Campus, Graduate School, *500 Lincoln Dr., Madison, Wisconsin* 53706 (DF581920; F19628-78-C-0137)

AF function - weather observing, analysis and forecasting for military operations. Deficiency - lack of information to meet military weather support requirements. Objective - to develop automated techniques which utilize meteorological satellite data and where necessary, conventional data in the objective specification and forecasting of mesoscale weather features. How development contributes -successful development of these techniques will allow automated forecasts of weather conditions at many locations satisfying AWS requirements specified in AWS TN 3-76.

Objective techniques will be developed using both satellite and conventional data. Use will be made of interactive data display systems to assist in identifying features of the satellite imagery and conventional data analyses that have potential as predictors. Tests will be made to evaluate how well forecasts with satellite data alone compare with those using conventional data as well.

5.0043, A REMOTE JOB ENTRY TERMINAL PROCESSOR

D.D. Houghton, University of Wisconsin, Madison Campus, School of Letters & Science, Dept. of Meteorology, *500 Lincoln Dr., Madison, Wisconsin* 53706 (ATM7818095)

Research programs in the University of Wisconsin Meteorology Department and Space Science and Engineering Center (SSEC) have in recent years involved large computational tasks. These include parameterization and simulation studies with NCAR and Goddard (formerly GISS) general circulation models, analysis and forecast with operational prediction models, and analysis of large volumes of observational data from satellite aircraft, and climatological data archives. Research for at least the next ten years will continue to be focused in areas such as these that rely heavily on external computer support. This equipment grant will allow to continue more effectively the present and future research and teaching in meteorology at this university. The proposed RJE facility will be part of an intelligent processor capable of emulating a variety of terminal disciplines, will allow the flexibility of communicating with virtually any scientific computing facility, will link directly to the data base manager in SSEC, and with future additional peripherals. The terminal could serve as an applications processor to a McIdas type (Chatters and Suomi, 1975) system and as such would serve as a valuable tool in meteorology department teaching.

5.0044, MEASUREMENT OF FLUOROCARBONS, NITROUS OXIDE, AND AEROSOLS IN THE ANTARCTIC STRATOSPHERE

D.J. Hofmann, University of Wyoming, School of Arts & Sciences, Dept. of Physics & Astronomy, *P.O. Box 3435, University Station, Laramie, Wyoming* 82070 (DPP7721202A01)

This is a continuation of NSF Grant DPP77-21202.

Balloon soundings to measure aerosols, condensation nuclei, nitrous oxide and fluorocarbons in the Antarctic stratosphere will be conducted at McMurdo and South Pole stations during the austral summers of 1978/79 and 1979/80. The data obtained will be used to (1) extend the existing data base and determine if seasonal and secular trends exist in their concentrations, (2) assess the effects of volcanic activity on the stratosphere and provide information on interhemispheric transport and exchange processes in the upper atmosphere, and (3) determine the importance of condensation nuclei on clear sky ice crystal precipitation in the Antarctic.

Logistics support is required for five persons at McMurdo and South Pole stations during the austral summers of 1979-80.

6.0002, NEUROPHARMACOLOGICAL EVALUATION OF TOXIC CHEMICALS

M.B. Sterman, University of California, Los Angeles Campus, School of Medicine, Dept. of Anatomy, *2025 Zonal Ave., Los Angeles, California* 90033 (DF319630; F33615-76-C-5014)

The 6570 AMRL has been investigating the pharmacological and toxicological effects of certain missile propellants in order to more safely use such compounds in a manner dictated by good industrial hygiene and industrial medical practice. In order to set standards for exposure criteria and to determine methods for combating the effects of those propellants and chemicals in exposed individuals, it is necessary to determine the exact mode of action of the agents on specific body function. The specific objective is to study the effects of hazardous chemicals of interest to the USAF on behavior responses in laboratory animals, obtain data on performance, correlate behavior changes with other neurological events, and test the efficacy of therapeutic measures to abort untoward effects of the agents.

A study will be conducted to advance the state-of-the-art with respect to the central nervous system effects of toxic chemical compounds of interest to the USAF. Previous studies in this regard have been performed using the cat as the primary model. Research with the cat has indicated a need to change the primary model to a primate for comparative purposes. It is now evident that certain forms of chemically induced epileptic manifestations are better studied in the primate. The specific agent to be studied using primate models will be the propellant, methylhydrazine. The data will be utilized to study mechanisms of action of the compound as well as various therapeutic regimens necessary to abort toxic manifestations. The data will also help develop toxicity criteria for the USAF as required by AFR 19-1.

6.0004, RESPONSE OF THE CARDIOVASCULAR SYSTEM TO VIBRATION AND COMBINED STRESSES

C.F. Knapp, University of Kentucky, School of Engineering, Dept. of Mechanical Engineering, *Limestone & Euclid, Lexington, Kentucky* 40506 (DF037240; F44620-74-C-0012)

AF function - environmental stresses such as acceleration may severely compromise aircrew performance. Circulation may be extended to critical limits since it is directly affected by acceleration and is indirectly involved in all adjustment of the body to environmental stress. Deficiency - with the recent development and deployment of high speed terrain-following tactical aircraft, operational crews are exposed to a dynamic acceleration environment with a significant frequency content below 1.5 Hz for extended periods of time. There is an acute lack of information available concerning responses at frequencies below 1.5 Hz. The design of effective countermeasures to acceleration stress depends upon the understanding of the mechanisms responsible for cardiovascular regulation. Because of the invasive nature of the instrumentation required for assessing cardiovascular responses, studies will be performed using chronically instrumented canines. Objective -the proposed studies are designed to 1) yield needed quantitative information about the cardiovascular system's ability to function in, and adjust to, ultra low frequency acceleration environments, and allow a qualitative evaluation of the possible hazards of exposure to such acceleration stress, and 2) to provide a means of analyzing the frequency response of the cardiac and vascular control mechanisms, acting to maintain circulatory integrity, during exposure to these dynamic, total-circulatory (i.e. whole body) acceleration loadings. How research contributes - this effort will provide the background required for the design and implementation of human investigations which would lead to improved protective equipment and operational procedures for military personnel exposed to the acceleration environment resulting from the optimal utilization of advanced aerospace systems.

Emphasis will be placed on the use of pharmacologic blocking agents to identify the frequency response of neural and adrenal mechanisms associated with cardiovascular regulation. The frequency response characteristics will be obtained from the magnitude of the physiological changes and their phase relationship to the acceleration loadings through the use of Fourier analysis.

6.0005, HIGH Q WINDBLAST FORCES ON MAN

L. Specker, Payne Inc., *Annapolis, Maryland* (DF323000; F33615-77-C-0523)

The forces acting on the ejecting crewman entering the windstream during emergency escape are the second most frequent major cause of all injuries experienced during ejection. Injuries attributed to windblast flail are encountered in 5.6 to 6.9 percent of all survived ejections, while 54 percent of ejections in the 450 to 600 KEAS range result in major injuries or fatalities. As the performance envelope of advanced aircraft systems is expanded, windblast injuries will probably become more common. With the advent of the newer bubble canopies, windblast forces are encountered before the crewman is clear of the aircraft. The data that have been collected on crewman during emergency escape have been limited to that portion of the escape sequence in which the crewman was exposed to free-stream conditions. One-ninth scale model wind tunnel tests of the F-16 aircraft have indicated that the environment within the cockpit before entry into the high speed windstream is potentially hazardous. The aerodynamic forces are increasing in magnitude and the turbulence levels encountered may seriously compromise the crewman's chance of survival before rescue. The objectives of this program are to provide measurements of the aerodynamic forces that are encountered during the initial and transitory phases in the turbulence about the cockpit in order that effective protection countermeasures can be developed.

The program will combine an analytical effort with a wind tunnel scale study. The model will be used to collect pressure and force data needed to quantify inertial and aerodynamic forces acting on the ejecting crewman to cause injury and the development of requirements for the design of personnel protection systems. The analytical effort will allow for the analysis of the

wind tunnel data as well as exploring the use of various testing facilities and techniques for windblast research.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Aerospace Medical Research Lab.

6.0006, DEVELOPMENT OF HUMAN PERFORMANCE MODELS FOR MAN-MACHINE SYSTEM SIMULATION
R.W. Pew, Bolt Beranek & Newman Inc., *50 Moulton St., Cambridge, Massachusetts* 02138 (DF042440; F44620-76-C-0029)

AF function - whatever the precise form of the final RPV operational capability, timely and reliable performance of human components will be critical to mission success. The most responsive design of an RPV system requires valid data on the functioning of the human operation. Deficiency - previous efforts have not provided information specific enough for detailed design of the total complex of rules, procedures and decision-making which must support new, more stringent system functions. Consequently, the task of combining human performance data in the solution of the man-machine reliability equation and, thereby, of assaying alternative system configurations cannot be satisfactorily accomplished. Objective - BBN proposes to develop and test improved models of human performance. These models are to be integrated with structure models of the tasks associated with control of RPV systems being developed by AMRL. How research contributes -promising models in sufficient detail for AMRL implementation and evaluation of their usefulness will identify subsystem model parameters having greatest influence on system performance. By exercising these models, systems engineers can predict the effects of changes in system parameters before proceeding to full-scale simulation efforts and the operational evaluation of prototype systems.

Modelling studies will be conducted in collaboration with AMRL/Human Engineering Division personnel to explore quantitatively and in detail several key issues in model development. Recommendations and guidelines will be prepared concerning the most suitable approaches, and resolving ambiguities in the application of simulation models in future model development programs.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Office of Scientific Research

6.0007, NOISINESS AND ANNOYANCE OF NOISE-TONE COMPLEXES

6.0008, EFFECTS OF SLEEP DEPRIVATION ON THE CENTRAL NERVOUS SYSTEM
A.K. Sinha, College of Medicine & Dentistry of New Jersey, Rutgers Medical School, School of Medicine, Dept. of Physiology, *Box 101, Piscataway, New Jersey* 08854 (DF051050; AFOSR-78-3532)

AF function - Air Force operations expose personnel to a wide range of physiological stresses including prolonged missions with altered work/rest cycles. Varying levels of fatigue and performance degradation may occur as a result of such conditions and thus could impact on the efficiency of aircrew members and support personnel. Deficiency - sleep loss and fatigue due to extended missions occur in many Air Force operations. The ability to reduce crew rest requirements would be a significant application of this research effort. Objective - it is generally accepted that dramatic and incapacitating behavioral changes take place in human subjects due to prolonged sleep deprivation. It is assumed that the behavioral decrement due to sleep loss is a consequence and symptomological expression of cellular and subcellular level changes taking place in the brain cells during the deprivation period. The long term objectives are to detect and describe some of these changes, to explore the possibility of reversing them (thereby reversing or minimizing the functional decrement) by chemical intervention and to determine if qualitatively some biochemical changes take place during cyclic alterations between normal sleep and wakefulness. How research contributes - this research will provide essential information on the effects of sleep deprivation on central nervous system integrity. Findings will be applied to the establishment of rest recovery procedures for flight crews/support personnel and will feed in to related on-going in-house 6.2 efforts at USAFSAM.

A variety of stressful situations is known to stimulate neuroprotease (lysosomal) activity. This generalization suggests that neuroprotease activity in brain will increase following sleep deprivation. A number of conditions (exercise, starvation, infection, hypoxia) and chemicals (progesterone, vitamin A, hyperbaric oxygen) are known to cuase simultaneous increase in neuroprotease activity and sleeping time. Based on these observations this effort proposes the following working hypothesis: prolonged wakefulness or sleep loss increases neuroprotease activity, which causes subcellular disorientation in brain cells and is behaviorally manifested in sleepiness and associated behavioral decrement. This hypothesis will be tested by light and electronmicroscopic survey of morphological changes in brain cells due to prolonged sleep loss. (Text Abridged)

6.0009, VCASS HELMET-MOUNTED DISPLAY DESIGN
M. Shenker, Farrand Optical Co. Inc., *New York, New York* (DF323770; F33615-78-C-0512)

The objective of this program is to accomplish an optimized system design for an extremely wide field-of-view (FOV), virtual image, head-coupled display system for the Visually Coupled Airborne Systems Simulator (VCASS) Program. This device will be utilized in conjunction with head and eye position sensing mechanisms and computer generated imagery subsystems to develop a wide FOV virtual scene simulator for engineering and training simulation applications.

The approach will be to develop a weighted matrix using appropriate analytical techniques which give in an engineering sense a figure of merit when related to the specified design criteria. When the matrix has been completed and design criteria are set a comprehensive study of potential design approaches will be made. The design approach which appears most promising will be selected for detailed analysis. Finally a detailed technical specification complete enough to allow fabrication of the design by any knowledgeable manufacturer of optics and display systems will be prepared.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Aerospace Medical Research Lab.

6.0010, INDIVIDUALIZED OXYGEN DELIVERY SCHEME
E.A. Patrick, University of Cincinnati, Graduate School, *305 Physics Bldg., Cincinnati, Ohio* 45221 (DF319700; F33615-77-C-0603)

The contractor is to identify and select several physiologically sound schemes for enhancement of an ideal oxygen delivery process that will provide the individual crew member with physiologically adequate amounts of oxygen while simultaneously ensuring optimal oxygen supply conservation. An accurate, reliable methodology, convertible to lightweight hardware at a later date, must be continuously changing flow demands imposed by the airborne crew member during various exposures of acceleration, altitude, and workload.

The eventual remedy to current hardware limitations must be based on development of alternative methodologies for oxygen delivery that can later be implemented with hardware fabrication. The starting point for this effort, to be detailed in this statement, should consist of (1) nomination and theoretical evaluation of candidate concepts for matching instantaneous oxygen delivery with crew member demand, (2) mathematical simulation of the two most promising schemes, as chosen by a panel of physiological investigators currently active in aerospace medicine endeavors. This suggested approach is necessarily contingent on respiratory property and response data that is available from qualified sources. The end product of this effort is expected to be a functional, physiologic-based scheme for accurately controlling the inflight delivery of oxygen, with maintenance of optimal crew member performance serving as the guiding criterion.

SUPPORTED BY U.S. Dept. of Defense, Air Force, School of Aerospace Medicine

6.0011, MYOELECTRIC FEEDBACK CONTROL OF VISUAL DISPLAY DIMMING

D. Rogers, University of Dayton, Graduate School, *300 College Park Ave., Dayton, Ohio* 45469 (DF228480; F33615-77-C-0080)

To design and develop a bionic controlled feedback system for controlling the acceleration induced dimming of a simulator pilot's visual environment including the visual display and instruments. Such training devices as the simulator for air-to-air combat (SAAC) have visual display dimming capabilities to simulate the vision loss of a pilot under high positive acceleration. However, this sytem is not pilot interactive, the pilot has no physiological (M-1 maneuver) control over the display. State-of-the-air simulators provide no means for a tactical aircraft simulator pilot to control visual display dimming as a function of g. This effort will result in a technique by which pilot straining (M-1) can be sensed and the signal used to control the g effect dimming of simulator visual displays.

The approach is to develop the software and hardware (electrodes and package) to include the pilot in the visual display/simulation control loop. Two algorithms will be developed. One will predict the human visual systems's response to both antecedent and current g-levels. The other will predict the pilot's increased g-tolerance as a function of his ability (which will be determined by monitoring electromyographic potentials from selected muscle groups) to perform the M-1 maneuver. Development of this algorithm will require experimentation with trained subjects to determine which muscle groups are the most reliable indicators of the effectiveness of the M-1 maneuver. The two algorithms will be integrated to drive a brightness controller for the pilot's visual field. The integrated system will be implemented on the T-38 simulator at the AFHRL Stars facility. If successful, the system may be refined and integrated with the simulator for air-to-air combat (SAAC). Model development complete - 8 MAC; electrode development complete - 9 MAC; integrated controller operational - 10 MAC; system delivered, integrated on stars - 11 MAC; final report - 12 MAC.

6.0013, PROCEDURAL TESTS FOR ANTI-G PROTECTIVE DEVICES

R.W. Thompson, Technology Inc., *8531 N. New Braunfalo Ave., San Antonio, Texas* 78217 (DF320570; F33615-77-C-0610)

The purpose of this effort is to provide more definitive data on standard and experimental anti-g valve operational characteristics. In addition a failure analysis life expectancy of g valves will be undertaken. The final products will be (a) the development of a standard experimental technique for evaluating anti-g valves, (b) a standard analytical approach for evaluating g valves, and (c) a failure analysis/life expectancy prediction of a g valve.

The contractor will impose various onset rates of g and absolute g levels to g valves using the SAM centrifuge while also modifying flow rates of air and inlet pressures of air to the valve. Using these experimental techniques he will develop and test an anti-g valve test protocol for reliability and producibility as a standard test procedure. Also using this technique, he will test standard and experimental valves in various modes of failure.

SUPPORTED BY U.S. Dept. of Defense, Air Force, School of Aerospace Medicine

6.0014, POWER AND CONTROL CONFIGURATIONS FOR A HIGH G-ONSET CENTRIFUGE DRIVE SYSTEM

T.J. Jones, Trinity University, Graduate School, Dept. of Engineering Science, *715 Stadium Dr., San Antonio, Texas* 78212 (DF052510; AFOSR-78-3622)

AF function - aircrew personnel operating high performance aircraft are exposed to increasing levels of rapid onset, sustained, repetitive maneuvering forces which can impose certain physiological responses that can affect operator performance in aerial combat. There is a need to conduct research utilizing test facilities such as the human centrifuge that will simulate these high g forces at levels of g and at rates of onset that match those of present or planned high performance aircraft. Deficiency - for a human centrifuge to provide an adequately realistic simulation of the environment of flight, the pilot to be trained must have control of the g force imposed, as he would through the control stick in an aircraft. In addition, for optimum simulation, the centrifuge should be capable of producing g onset rates from one g to several g per second. Objective - this research will investigate centrifuge power and control configurations which provide pilots (gondola subjects) controlled high g onset rates capable of simulating aerial combat maneuvers in new high performance aircraft. How research contributes - a research centrifuge's power and control system should, as much as possible, simulate the g forces, and g onset rates, produced by high performance fighter aircraft during aerial combat maneuvers. Any modifications, or new or additional gear necessary for achieving aerial combat maneuver simulation should be incorporated in a manner making them maximally compatible with existing equipment. This work supports subarea 1.6, 'habitable crew environments in AF operations.'

This study will be carried out by gathering data and specifications on available power equipment, and using this information in an analysis which will contain the mathematical model of the centrifuge arm and gondola. Methods of control will be included in the overall model. In this manner a number of possible solutions to the problem of pilot-controlled high g onset rates can be obtained. Both all-electric and hydraulic power systems with appropriate controls for each will be considered. Computer programs analyzing the system are to be run on Trinity University's IBM 370/155 computer. Standard programs employing CSMP as well as ones written using APL or FORTRAN would be used in the analysis.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Office of Scientific Research

6.0015, APPLIED PREDICTIVE MODEL FOR HUMAN EXPOSURE TO THERMAL STRESS IN USAF OPERATIONS

E.H. Wissler, University of Texas, Austin Campus, School of Engineering, Dept. of Chemical Engineering, *200 W. 21st, Austin, Texas* 78712 (DF320430; F33615-77-C-0602)

This effort is designed to develop a computer model for predicting human response to the thermal stresses encountered in USAF operations. Use of such a model should permit prompt answers to questions from the field without the need for human experimentation, and should also serve to pinpoint critical areas where further investigation is indeed required. Although a number of programs on thermoregulation are already in existence, none is immediately suitable for USAF application. This effort will produce either a new model or a modification of an older one for this purpose.

The contractor will develop a digital computer program for predicting human response to thermal stress. The objectives of this contract are (1) to conduct a review of existing models to determine their suitability for this application, (2) to write a new program or modify an existing one to meet the technical requirements, (3) to provide computer programs written in FORTRAN, compatible with USAFSAM computer hardware, and (4) to compose a technical report summarizing the literature review and citing the experimental findings which form the basis for the model.

6.0016, EFFECTS OF ANTI-G MEASURES ON GAS EXCHANGE

H.I. Modell, University of Washington, School of Medicine, Dept. of Physiology & Biophysics, *500 17th Ave., Seattle, Washington* 98122 (DF051920; F49620-78-C-0058)

AF function - the Air Force operational environment involves exposure to a wide variety of mechanical forces including high sustained acceleration (HSG). It has been recognized that cardiovascular responses can be encountered which may be particularly important in determining performance capabilities in aircrew members. Although information is available concerning physiological effects of moderate exposure to g (up to 5g), little information is available at higher levels of g exposure such as might be experienced during aerial combat maneuvers flown in the F-15 and F-16 high performance aircraft. Deficiency - several questions remain to be answered relevant to high sustained g (HSG) tolerance if more effective protective measures are to be developed. This study will elucidate on the extent to which commonly used protective measures (e.g., anti-g suits, straining manuevers) enhance or impair ventilation-perfusion ratios and the development of atelectasis at 1g and during exposure to HSG, the time course of gas exchange detriment resulting from use of these protective devices, the means by which these measures can be modified to optimize gas exchange during HSG. Objective - the overall objective of this research is to determine the extent to which commonly used anti-g measures enhance or impair gas exchange at 1 g and during exposure to HSG. How research contributes - this research will directly feed-in to ongoing exploratory development work conducted at USAFSAM and is covered under sub-area 1.6, 'habitable crew environments in Air Force operations.'

Animal experiments designed to examine changes in ventilation-perfusion distribution and atelectasis will be conducted at 1g in the University of Washington laboratory and at HSG at USAFSAM. Protective measures to be examined include the anti-g suit abdominal bladder, positive pressure breathing, and the combined measures of anti-g suit abdominal bladder and positive pressure breathing. In addition to the experimental studies, the computer model of gas exchange presently under development for USAFSAM by Collins' study will be extended to include nonsteady state pulmonary gas exchange and effects of anti-g protective measures on ventilation-perfusion distribution and gas exchange.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Office of Scientific Research

6.0017, TASK LOAD AND OPERATOR ATTENTION CAPACITY IN TIME SHARING PERFORMANCE

D. Gopher, Technion, Israel Inst. of Metals, *Haifa, Israel* (DF046760; AFOSR-77-3131)

AF function - this research supports aircrew training, aircrew performance in high task load environments (e.g., combat), and overall force readiness. Deficiency - as the role of the pilot is shifting from a direct controller of aircraft functions to a monitor and decision-maker in a complex, dynamic, and intelligent man-machine system, we need to measure those abilities which support this new role. The increasing complexity of flight missions combined with the growing sophistication of airborne systems and the concurrent increase in production and training costs emphasize the need for improved assessment techniques for pilot attention capacity and task loads. Objective - the research activity will follow three major lines - (1) development of a quantitative assessment of time sharing efficiency, (2) training for time sharing, and (3) development of software packages, including feedback devices and adaptive techniques. How research contributes -improved techniques and prediction equations for the evaluation of task load and operator efficiency in time sharing situations will be utilized in system design and development, the structuring of aircrew training programs, and the assessment of the workload quotient of various tactical maneuvers.

In FY-78 the research will be devoted to achieving the following goals - (1) cross-validation and improvement of procedures developed during the first year, (2) expansion and diversification of the investigation of performance limitations by adding new tasks to the existing battery. Visual monitoring, memory, reaction time and dichotic listening tasks have been constructed and incorporated in experimental designs, (3) experimentally investigate both dual-task and triple-task conditions, (4) increase emphasis on developing theoretical concepts that can tie applied human factors research with the general theory of attention.

MATHEMATICAL AND COMPUTER SCIENCES

Includes Mathematical and Computer Sciences (general); Computer Operations and Hardware; Computer Programming and Software; Computer Systems; Cybernetics; Numerical Analysis; Statistics and Probability; Systems Analysis; and Theoretical Mathematics.

7.0001, BLENDING ELEMENT-DIFFERENCE SCHEMES

G.H. Golub, Stanford University, School of Humanities & Sciences, Dept. of Computer Science, *Stanford, California* 94305 (NCA 2-745912)

SUPPORTED BY U.S. National Aeronautics & Space Admin., Ames Research Center

7.0002, STUDY ON ONE- AND TWO-DIMENSIONAL FILTERING AND DECONVOLUTION ALGORITHMS FOR A STREAMING ARRAY COMPUTER

G.E. Ioup, Louisiana State University, University of New Orleans, School of Arts & Sciences, Dept. of Physics, *1542 Tulane Ave., Lake Front, New Orleans, Louisiana* 70122 (NSG 1648)

SUPPORTED BY U.S. National Aeronautics & Space Admin., Langley Research Center

7.0003, NONLINEAR OSCILLATIONS BY TOPOLOGICAL AND FUNCTIONAL ANALYTIC METHODS 12981-M

J.C. Scanlon, Rutgers the State University of New Jersey, New Brunswick Campus, School of Arts & Sciences, Dept. of Mathematics, *Old Queens Bldg., New Brunswick, New Jersey* 08903 (DA0K5572; DAHC04-75-G-0148)

To determine useful conditions for the existence and stability of periodic and almost periodic solutions of ordinary and functional differential equations, and to study bifurcation phenomena in nonlinear problems. Relevance - the questions of existence and stability of periodic solutions of nonlinear problems arise in a variety of areas, e.g., flap-lag stability analysis of helicopter rotor blades. These problems are aggravated when hysteresis or material memory introduces a time lag into the system. Bifurcation studies serve a dual role, supporting the theoretical existence studies mentioned above and unraveling such practical problems as buckling and sudden changes of structural response due to the variation of a physical parameter.

To formulate these problems in an abstract function space and apply the methods of topological degree theory to the resulting operator equations.

SUPPORTED BY U.S. Dept. of Defense, Army Materiel Development & Readiness Command, Army Research Office

7.0004, EFFECTIVE BEHAVIOR OF COMPOSITE MATERIALS

G.C. Papanicolaou, New York University, Washington Square & University College of Arts & Sciences, Dept. of Mathematics, *421 1st Ave., New York, New York* 10012 (DF053040; AFOSR-78-3668)

AF function - aerospace vehicle design. Deficiency - design techniques for fastening composite materials. Objective - improved understanding of edge effects in composites. How work contributes -cracking and separation of laminates is influenced by stresses due to edge effects.

Asymptotic techniques including multispace and averaging have been used to obtain macroscopic equations for media with periodic fine structure like composites valid sufficiently far from edges. It is proposed to extend this work to areas including edge

effects, irregular structure with associated fluctuation equations, and humidity transport and associated swelling as for example in epoxy.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Office of Scientific Research

7.0005, MATHEMATICAL MODEL (KRASH) OF CH-47A CRASHWORTHINESS

Y. BadriNath, Boeing Co., Vertol Division, *P.O. Box 16858, Philadelphia, Pennsylvania* 19142 (DA0D4040; DAAJ02-76-C-0015)

The objective of this program is to (1) simulate the dynamic response of a CH-47A helicopter to crash impact using computer program KRASH; (2) correlate the predictons of KRASH with data from a full-scale CH-47A crash test; and (3) recommend improvements to KRASH.

The structural response of a CH-47A to crash impact will be modeled using KRASH, and the initial impact conditions planned for a CH-47A full-scale crash test to be performed jointly by ATL and NASA at NASA's Langley Research Center. Following the test the model will be correlated with the test data and the CH-47A model improved. The contractor will recommend improvements to the KRASH computer program.

SUPPORTED BY U.S. Dept. of Defense, Aviation Research & Development Command, Applied Technology Lab.

7.0006, FINITE ELEMENT ANALYSIS OF TRANSONIC FLOWS 14371-M

G.J. Fix, Carnegie Mellon University, Mellon Inst. of Science, Dept. of Mathematics, *4400 5th Ave., Pittsburgh, Pennsylvania* 15213 (DA0E9249; DAAG29 77 G0026)

To investigate the numerical solution of the partial differential equations describing transonic flow. Relevance - the subject matter has clear relevance to many Army flight problems including flows around rotors, missiles and artillery projectiles.

A new variational principle will be implemented which has certain desirable properties when used in conjunction with the finite element method. This variational principle will be investigated first in the two-dimensional case and then later in the three-dimensional case.

SUPPORTED BY U.S. Dept. of Defense, Army Materiel Development & Readiness Command, Army Research Office

7.0007, CONTINUUM THEORY OF FRACTURE

M.E. Gurtin, Carnegie Mellon University, Mellon Inst. of Science, Dept. of Mathematics, *4400 5th Ave., Pittsburgh, Pennsylvania* 15213 (DF043720; AFOSR-76-3013)

AF function - damage tolerance of advanced aerospace vehicles is essential to reductions in AF cost of ownership. Deficiency - new failure criteria are needed to accurately predict the fracture process under a wide range of materials (metals and composites) and environmental states. Objective - the objective of this research is to investigate new fracture theories for metallic structures and to apply continuum mechanics based upon basic energy balance considerations and diffusion to the durability of composites. How work contributes -research contributes to improved failure resistant designs for aircraft and solid propulsion vehicles.

Principal investigator is approaching the fracture problem as a rational treatment of energy balance. The energy of the fracture surface should be treated as a loss in binding energy caused by the creation of new fracture surfaces. Consideration will be given to the propagation of the fracture surfaces and the effects of temperature. Moisture absorption will continue to be investigated as a diffusion process in a deforming solid. Both moisture and temperature considerations will be included in the study. The influence of free and bound states of moisture in the solid will be studied, as well as interfacial diffusion.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Office of Scientific Research

7.0008, RESEARCH IN DIFFERENTIAL GAME THEORY

M. Mintz, University of Pennsylvania, Moore School of Electrical Engineering, *203 Logan Hall, Philadelphia, Pennsylvania* 19104 (DF048690; AFOSR-77-3327)

AF function - research in differential game theory for conventional Air Force weapons systems. Deficiency - mathematical models for determining evasion strategies for an aircraft threatened by a multiple missile attack has not been fully investigated. Objective - the objective of this research is to develop an improved mathematical model which (1) accounts for the uncertainties and modeling errors associated with the dynamics of multiple pursuing missiles, and (2) leads to the determination of a suitably robust algorithm for specifying the optimal evasion stategies. How work contributes - success here would allow system operational planners to devise methods to avoid a hostile air-to-air or surface-to-air attack on planned air missions.

The proposed research will be divided into three related areas. First, the development of an improved mathematical model which accounts for uncertainties in the assumed missile dynamics which are used in the determination of the optimal evasion strategies will be investigated. Second, the computation of saddle-point solutions for the current mathematical/computer model developed under previous research which assumes simplified dynamics and perfect information will be pursued. Finally, there will be simulation studies to determine the sensitivity of the optimal evasion strategies to uncertainties in the underlying parameters dynamic structure.

PHYSICS

Includes Physics (general); Acoustics; Atomic and Molecular Physics; Nuclear and High-energy Physics; Optics; Plasma Physics; Solid-state Physics; Thermodynamics and Statistical Physics. For Related Information See Also Engineering.

8.0001, TIME-OF-FLIGHT MOLECULAR SPECTROSCOPY

W.E. Lamb, University of Arizona, School of Liberal Arts, Dept. of Physics, *Tucson, Arizona* 85721 (DF039720; AFOSR-75-2864)

AF function - this research contributes to RO 6.3, electromagnetic weaponry. Opportunity - the search for new lasing media will be facilitated if potential energy diagrams of candidate molecules are known. Objective - to make velocity-resolved studies of the production of metastable atoms from dissociating molecules and their de-excitation by collisions with other atoms and molecules. Contribution - this research has the capability of establishing the potential energy diagrams of a number of diatomic molecules of interest to new lasers.

A time-of-flight spectrometer is being used to obtain high-resolution electron-bombardment dissociation spectra and collisional quenching cross-section data for molecules of importance as reservoirs of potential energy which can be transferred to other lasing species.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Office of Scientific Research

8.0002, ENERGY TRANSFER REACTIONS OF EXCITED ATOMS AND MOLECULES 14708-C

G. Black, S R I International, *300 Ravenswood Ave., Menlo Park, California* 94025 (DA0F9016; DAAG29 77 C 0018)

To determine the kinetics for reactions involving oxygen molecules and atoms with various species prevalent in the upper atmosphere. Relevance - the kinetic data to be determined will

have application in on-going Army programs in combustion, laser, and possibly in optical surveillance systems and in atmospheric modeling.

A range of spectroscopic techniques including photon counting, resonance fluorescence and absorption, time-resolved radiative decay measurements, pulsed flash lamps, and laser excitation will be utilized in the investigation to be undertaken.

SUPPORTED BY U.S. Dept. of Defense, Army Materiel Development & Readiness Command, Army Research Office

8.0003, FUNDAMENTAL EXPERIMENTS AT LIQUID HELIUM TEMPERATURES

W.M. Fairbank, Stanford University, School of Humanities & Sciences, Dept. of Physics, *Stanford, California* 94305 (DF027070; F44620-75-C-0022)

AF function - the proposed research primarily falls in the 7.1 research objectives which deal with reconnaissance and surveillance. In particular the experiments involving the production and trapping of very low energy ground state electrons in a weak magnetic field lead to a photon counting millimeter wave detector. AF operations require the search and mapping of regions of interest in real- or near-real-time in order to detect, identify, locate, count or investigate weapons, personnel, vehicles, installations by microwave, electronic and other sensing methods. Deficiency - the far infrared portion of the electromagnetic spectrum is an underdeveloped area that potentially could contribute significantly to remote sensing. This probable interaction of such radiation with materials along with high atmospheric transmission in many bands and especially at the longer wavelengths gives rise to interest regarding potential reconnaissance or surveillance application. Objective - they propose to continue their investigation of the temperature-dependent anomalous shielding effect which we observe on the surface of a copper tube at liquid helium temperatures. During the present contract year they expect to conclude experiments which will determine the behavior of the shielding effect at temperatures below 4.2K (probably down to 2.5K or so) and which will yield improved measurements in the 4.2K-9 region. Contribution - this research is a part of a comprehensive program in low temperature physics.

During the next year the development of the electron/positron thermalizer as a photon counting detector will be continued. Optimization of the device for use in the surface shielding work will be directed toward operating the thermalizer with a positron beam. The problems of interfacing the thermalizer to the time-of-flight apparatus include minimizations of physical size, magnetic field matching and shielding of the high energy particles emitted by the radioactive source at the ejector stage of the thermalizer. Use of the thermalized electron source will allow significant improvements in counting statistics and because of the reduced time needed for data acquisition, will make it possible to perform many more experiments on the surface shielding effect.

8.0004, LOW TEMPERATURE PROPERTIES OF MATERIALS

N.E. Phillips, University of California, Berkeley Campus, Lawrence Berkeley Lab., *Berkeley, California* 94720

The general objective is to obtain low-temperature heat-capacity data that contribute to an understanding of the relations between atomic properties and the macroscopic properties of materials. The materials investigated include normal and superconducting metals, superfluids, dielectric solids, and magnetic materials. Heat capacity measurements are confined to temperatures below 25K because usually only in that region can various contributions be reliably separated. Establishment of a temperature scale for the region from 0.06 to 25 K on germanium resistance thermometers is anticipated. For temperatures from 0.06 K to below 1 mK nuclear susceptibility and gamma-ray anisotropy thermometers will be used as primary thermometers. (ERDA-77-123)

8.0008, MAGNETIC TEXTURES AND SURFACE EFFECTS IN LIQUID 3 HE AT ULTRA LOW TEMPERATURES

H.M. Bozler, University of Southern California, School of Letters Arts & Sciences, Dept. of Physics, *3551 University Ave., Los Angeles, California* 90007 (DMR7900830)

This research is a continuation and extension of work supported by NSF Grant No. DMR7702160. Pulsed nuclear magnetic resonance techniques will be used to investigate magnetic textures in the A phase of superfluid helium-3. Several experiments will be undertaken to observe the effects of restricted geometries on these textures in order to test various aspects of the theory of solutions. Magnetic textures generated by heat flow will be studied to test predictions of current theories regarding the nature of textures in superfluid helium-3. Thermal conduction across boundaries between liquid helium-3 and metallic surfaces will be studied at temperatures as low as 0.4MK; such data will probe the effects of magnetic coupling on the thermal conductance across boundaries. Enhanced surface magnetism of helium-3 in contact with various substrates will also be investigated. This research is important for our fundamental understanding of quantum liquids and solids.

First year of a three-year continuing grant.

SUPPORTED BY U.S. National Aeronautics & Space Admin., Marshall Space Flight Center

8.0017, APPLICATION OF MODERN METHODS OF STATISTICAL MECHANICS TO THE PERCOLATION PHENOMENON 15750-P

H.E. Stanley, Boston University, School of Arts & Sciences, Dept. of Physics, *881 Commonwealth Ave., Boston, Massachusetts* 02215 (DA0G8931; DAAG29-79-G-0002)

To develop percolation theory to a level of sophistication that allows its use in a number of Army applications. Relevance - the research is potentially relevant to ongoing work on composites, particularly in areas of graded metal-ceramic armour, airfoil noise reduction, reduction of blast damage and related phenomena. It may prove important to other phenomena such as crack propagation, chemical reactivity, resistance to wear, printed circuit wiring, and phenomena in solid state physics such as semiconductor-metal transitions.

Modern methods of statistical mechanics, such as the renormalization group method and fractural dimensionality, will be used. Equations of state near the percolation threshold will be derived. Six generalizations of the classical percolation problem will be constructed and solved involving correlation, anisotropy, further-than-nearest-neighbors interaction, chains, and site-bond combinations.

SUPPORTED BY U.S. Dept. of Defense, Army Materiel Development & Readiness Command, Army Research Office

8.0018, ANALYSIS OF METAL/SEMICONDUCTOR STRUCTURES BY AUGER AND ELECTRICAL TECHNIQUES

G.Y. Robinson, University of Minnesota, Minneapolis Campus, School of Engineering, Dept. of Electrical Engineering, *105 Morrill Hall, Minneapolis, Minnesota* 55455 (DMR7614997A01)

This research will be a study of metal/semiconductor contacts using the surface analysis technique of Auger electron spectroscopy combined with conventional electrical characterization techniques. The aim is to develop an understanding about the metallurgical and chemical nature of the metal/semiconductor interface. Research in two areas will be completed during the grant period: (1) studies of the electrical behavior of aluminum-palladium silicide contacts during heat treatment and (2) development of techniques for achieving ohmic contact in the palladium-germanium-gallium arsenide system. Compositional profiling will be done by Auger electron spectroscopy to examine the kinetics of reactions in each of the two systems. A limited number of specimens will also be examined by electron spectroscopy for chemical analysis.

This is a renewal of NSF Grant DMR 76-14997.

SUPPORTED BY U.S. National Science Foundation, Directorate for Mathematical & Physical Sciences, Div. of Materials Research

8.0019, OPTICAL HYPERFINE STRUCTURE AND ISOTOPIC SHIFT STUDIES

G.W. Greenlees, University of Minnesota, Minneapolis Campus, School of Liberal Arts, Dept. of Physics, *322 Johnston Hall, Minneapolis, Minnesota* 55455 (PHY7721737A02)

This grant will support research on fine details of atomic spectra using very high precision laser techniques. These measurements yield information on the electric and magnetic properties of the nuclei of the atoms studied.

These techniques are also highly sensitive allowing measurement on a single atom crossing the laser beam.

The method will be used to study highly unstable nuclei which are produced only in small quantities and decay quickly.

SUPPORTED BY U.S. National Science Foundation, Div. of Physics

8.0020, THEORETICAL STUDIES OF SPIN CORRELATION FUNCTIONS

P.A. Fedders, Washington University, School of Arts & Sciences, Dept. of Physics, *4559 Scott Ave., St. Louis, Missouri* 63130 (DMR7706719A01)

A theoretical program of four partially overlapping categories will be carried out: 1. The study of time-dependent spin correlation functions for systems of strongly interacting spins in the high temperature limit. These studies are based on first principles microscopic equations of motion and should elucidate our understanding of dynamical interactions in spin systems. 2. The development and application of a recently discovered formalism for treating the hopping of vacancies, impurities, and interstitial hydrogen in crystal lattices. This formalism is applicable to correlation functions measured in neutron scattering and magnetic resonance experiments in systems where the hopping rates between members of a pair of sites are asymmetric. 3. The further study of the effects of impurities and other crystal defects on measurable spin correlation functions. The proposed work in this category attacks the important problem of how one can quantitatively study crystal defects. 4. The study of basic spin-phonon interactions and their effects on spin lineshapes and on acoustic velocity and attenuation.

This is a continuation of research supported under DMR7518100.

SUPPORTED BY U.S. National Science Foundation, Directorate for Mathematical & Physical Sciences, Div. of Materials Research

8.0021, IMPROPER FERROELECTRICITY - A THEORETICAL AND EXPERIMENTAL STUDY 14221-P

J.R. Hardy, University of Nebraska, Lincoln Campus, School of Arts & Sciences, Dept. of Physics, *Lincoln, Nebraska* 68508 (DA0E9251; DAAG29 77 G0008)

To elucidate the physical mechanism responsible for the ferroelectric transition in improper ferroelectrics. Relevance - the results of this research explore the mechanism for a new class of materials that have high potential in electro-optic application. GMO acts as an optical switch; its present applicability is limited because of its slow response time. The work is applicable to a broad range of electrooptical materials and as such supports the technological base of nonlinear optics and electro-optical materials.

The program combines a theoretical and experimental program. (1) Theory - the author will consider anharmonic interactions using self-consistent phonon theory to gadolinium molybdate (GMO) in addition to calculation of the lattice dynamics of complex structures like those of other improper ferroelectrics. Some candidate systems are the boracites, dicadmium sulfate and ammonium sulfate. (2) Experimental studies will consist of the measurement of the Raman and far-infrared spectra of these materials as well as a study of the effects of pressure (up to 50 kilobars) and temperature to elucidate mode-Gruneisen parameters.

SUPPORTED BY U.S. Dept. of Defense, Army Materiel Development & Readiness Command, Army Research Office

8.0022, THE PHYSICS OF SPIN-POLARIZED ATOMIC VAPORS

W. Happer, Columbia University, School of Arts & Sciences, Dept. of Physics, *Broadway & W. 116th St., New York, New York* 10027 (DF038840; AFOSR-74-2685)

AF function - the AF has a requirement for long term, low drift space reference systems. Opportunity - development of optically-pumped frequency standards, magnetometers, and gyroscopes will benefit from study of magnetic resonance in dense vapors where spin exchange equilibrium prevails. Objective - investigation of the properties of high-density, optically-pumped alkali vapors and development of ways to make use of these vapors in miniature, inexpensive devices like magnetometers and gyroscopes. Contribution - cheaper and more rugged navigation, guidance, and control devices.

This research is directed toward development of ways to optically pump a very dense alkali vapor with a laser. Advantages are: the high light flux from the laser will allow much more sensitive and rapid measurements of magnetic resonance frequencies than is feasible with conventional optically-pumped systems or with conventional nuclear magnetic resonance or electron spin resonance techniques, since gallium arsenide injection lasers are very small and potentially very inexpensive; a laser pumped magnetic resonance device can be very small and cheap compared to conventional devices; and the active volume of a device operating in the high density regime can be very much smaller than usual.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Office of Scientific Research

8.0023, NEW SEMICONDUCTOR MATERIALS FOR MICROWAVE DEVICES 14354-EL

J. Frey, Cornell University, Ithaca Campus, School of Engineering, Dept. of Electrical Engineering, *242 Carpenter Hall, Ithaca, New York* 14853 (DA0F9118; DAAG29-78-G-0009)

To identify ternary and quaternary III-V compound semiconductors which may be more suitable than GaAs for high-performance microwave devices, such as field-effect transistor (FET's) and transferred-electron devices (TED's). Relevance - microwave devices fabricated from III-V ternary and quaternary materials offer the possibility of extending the frequency-of-operation, increasing the available power and gain, and decreasing the noise over existing GaAs devices. Such devices would impact Army communications/navigation systems in tactical, satellite, and missile guidance applications.

The Monte Carlo method will be used to study the steady-state and transient high-field transport properties of III-V ternary and quaternary semiconductors. Material parameters will be obtained from an interpolation procedure which uses known material parameters for the binary compounds of which the ternary and quaternary materials are composed. This technique will generate fundamental transport parameters which will then be used in device models to predict figures-of-merit for FET's and TED's. The fundamental gain, power, frequency response, and noise-determining mechanisms will be studied.

P.M. Levy, New York University, Washington Square & University College of Arts & Sciences, Dept. of Physics, *421 1st Ave., New York, New York* 10012 (DMR7825008)

Research previously supported in part by DMR7682363.

Theoretical and experimental research will be carried out on a number of properties of a particularly interesting class of metallic compounds, viz. the rare-earth pnictides. The unusual properties of these compounds are due to the large orbital contribution to the magnetic moments of the rare earths, which complicates the interaction between the rare earth and conduction electrons. The effects on the magneto-transport properties of the spin-orbit coupling of the 5D electrons will be calculated. To obtain more realistic estimates of the anisotrophy of the magnetoresistivity of cubic rare-earth compounds due to scattering of the conduction electrons, a variational form of the resistivity will be used. To complement the theoretical work, an experimental study of the anisotropic electrical resistivity of the rare-earth pnictides is planned. These measurements will provide data on the background anisotropy coming from the band structure. To determine the hyperfine field at rare-earth nuclei in metallic compounds, the field coming from the orbital polarization of the conduction electrons by the electrons will be calculated.

This is the first year of a three-year continuing grant.

8.0027, NEUTRON SCATTERING STUDIES

L. Corliss, U.S. Dept. of Energy, Brookhaven National Lab., *Upton, New York* 11973

The following subjects are being investigated: neutron scattering measurements to obtain structural and dynamic properties of solids; magnetic systems; spatial distribution of magnetization, its response to applied fields, and behavior of spontaneous magnetic fluctuations; complete characterization of the magnetic ordered and disordered states as well as the interesting critical region in the neighborhood of the ordering transition; arrangement of atoms and dynamics of motion of nonmagnetic solids. (DOE/ER-0002)

SUPPORTED BY U.S. Dept. of Energy, Office of Energy Research

8.0028, EXPERIMENTAL RESEARCH - SURFACE STUDIES

M. Strongin, U.S. Dept. of Energy, Brookhaven National Lab., *Upton, New York* 11973

The following subjects are being investigated: use of AC pulsing techniques under ultrahigh vacuum conditions to study chemical reactions such as the oxidation of CO on the surfaces of single-crystal and polycrystalline Group VIII metals (Pt, Pd, Rh, Ru, etc.) and transition metal oxides; understanding and development of secondary ion mass spectroscopy for chemisorption studies; correlation with chemisorption bonds and surface phases; and interaction of low-energy ions with surfaces. (ERDA-77-123)

SUPPORTED BY U.S. Dept. of Energy, Div. of Basic Energy Sciences

8.0029, LIQUID HELIUM AT LOW TEMPERATURES

D.O. Edwards, Ohio State University, Columbus Campus, School of Mathematics & Physical Sciences, Dept. of Physics, *164 W. 17th Ave., Columbus, Ohio* 43210 (DMR7901073)

This research is a continuation and extension of work supported under NSF Grant No. DMR-7519546. Experiments to study the free surface of liquid helium will be carried out at temperatures down to 0.02K using a dilution refrigerator. The measurements will include the conduction of heat along the surface by quantized capillary waves, the scattering of free helium atoms, and the heat capacity of helium-3 atoms adsorbed on the surface of superfluid helium-4. The superfluid properties of helium-3 at ultra-low temperatures (down to 0.0004K) will be studied using a nuclear demagnetization cryostat. The experiments will include measurements of the heat capacity of the A and B superfluid phases and of the normal liquid in zero magnetic field, of the superfluid phase diagram and the nuclear magnetization in fields up to 6 kilogauss. The same apparatus will also be used to study nuclear spin ordering in solids helium-3.

First year of a three-year continuing grant.

SUPPORTED BY U.S. National Science Foundation, Directorate for Mathematical & Physical Sciences, Div. of Materials Research

8.0030, FLUX PINNING AND FLUX FLOW STUDIES IN SUPERCONDUCTORS USING FLUX FLOW NOISE TECHNIQUES

W.C. Joiner, University of Cincinnati, McMicken College of Arts & Sciences, Dept. of Physics, *Van Wormer Adm. Bldg., Room 204, Cincinnati, Ohio* 45221

The objective of this work is to study flux pinning and the dynamics of flux flow in type-II superconductors. Superconducting alloy samples will be prepared containing various metallurgical defects and exhibiting different critical current characteristics resulting from the defect structure, and the flux flow noise power spectrum will be studied. This gives information on flux bundle size, transit time, pinning forces, and other flux flow parameters. (ERDA-77-123)

SUPPORTED BY U.S. Dept. of Energy, Div. of Basic Energy Sciences

8.0031, THEORETICAL STUDIES OF NUCLEAR STRUCTURE AND NUCLEAR REACTIONS

N. Austern, University of Pittsburgh, School of Arts & Sciences, Dept. of Physics, *4200 5th Ave., Pittsburgh, Pennsylvania* 15260 (PHY7681104A02)

Theoretical research on nuclear structure and reactions and related studies of medium-energy meson-nucleus processes and of multiple scattering theory initiated under NSF grant PHY75-01397 A01 will be continued.

The nuclear structure work emphasizes a large-scale study of properties of the shell-model effective interaction, derived by the systematic selection of a limited part of Hilbert space. Careful study is given to the singularities of this effective interaction. Techniques for overcoming these singularities and for other improvements to the effective interaction are being developed.

A vigorous program in 'medium-energy nuclear physics' will be continued. Computer codes developed for meson-nucleus collision studies have been improved and generalized so they can be used more conveniently at Pittsburgh and made available to others. Applications to kaon scattering are under way, as are studies of mesic atoms and of pion photoproduction and capture. Much of this work is in collaboration with experimental groups at Carnegie-Mellon University and at LAMPF. Other medium-energy work concerns fundamentals of multiple scattering theory, with particular attention to corrections to closure and to the impulse approximation.

SUPPORTED BY U.S. National Science Foundation, Div. of Physics

8.0032, THEORETICAL ATOMIC PHYSICS

R.L. Becker, U.S. Dept. of Energy, Oak Ridge National Lab., *P.O. Box X, Oak Ridge Operations Office, Oak Ridge, Tennessee* 37830 (AK-01-03-01-3; W7405-eng-26)

Initiated as a separate project in FY-78 this activity aims to perform calculations and develop theories for important atomic processes, primarily those under experimental investigation at ORNL, with emphasis on cross-sections and spectroscopy useful to the magnetic fusion energy and heavy-ion accelerator programs. At present effort is concentrated on calculating charge exchange and ionization produced by energetic highly stripped ions colliding with atomic hydrogen, which are being measured at ORNL and are important as energy-loss mechanisms resulting from impurities in plasmas. Also the capability to compute spectra of multi-charged ions is being developed for use in the diagnostics and modeling of plasmas. Consulting and collaboration with experimentalists is an important activity expected to increase as theoretical tools are developed. Participation by university theorists will be encouraged strongly. (ORNL/CF-78/111)

8.0033, INVESTIGATIONS IN X-RADIATION STIMULATION

K. DasGupta, Texas Tech University, School of Arts & Sciences, Dept. of Physics, *P.O. Box 4340, Lubbock, Texas* 79409 (DF035070; AFOSR-76-3098)

AF function - non-destructive testing of structural members of aerospace vehicles could benefit greatly from the development of an X-ray laser for use in three-dimensional holography. Deficiency - attempts to develop an X-ray laser by standard population inversion techniques have been unsuccessful primarily because of short life-times of excited states. Objective - the objective of this research is to investigate the nature of nearly non-divergent beams of X-rays (hot spots) which apparently are generated by hitherto undiscovered processes and to use this

radiation to make three-dimensional holograms of opaque materials. How work contributes - an understanding of the nature of these hot spots could lead to or contribute to the development of X-ray lasers and three-dimensional holography could lead to important non-destructive testing techniques for structural materials.

The nearly non-divergent beams of X-rays will be studied to determine their penetration properties in various materials, role of stimulated emission, and the degree of coherence and polarization. Three-dimensional holograms will be made in collaboration with Prof. N. George of the University of Rochester.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Office of Scientific Research

8.0034, INVESTIGATION OF THE INITIATION OF SOLID STATE STRUCTURAL PHASE TRANSFORMATIONS AT CRYSTAL SURFACES BY LOW-ENERGY ELECTRON DIFFRACTION

A. Ignatiev, University of Houston, School of Arts & Sciences, Dept. of Physics, *3801 Cullen Blvd., Houston, Texas* 77004 (DA0K5574; DAAG29 77 G0162)

To investigate the initiation at surfaces of structural phase transformations of the non-diffusional Martensitic type in solids. Relevance - the proposed research is highly relevant to the technologically important Martensitic phase transformation and its control is responsible for strengthening the steels used by the Army, for control of fragmentation, fatigue, stress corrosion cracking, etc. The study is directly relevant to programs at AMMRC involving phase transformations in metals.

The program will include (1) determination of virbrational properties and crystallographic spacing of surface atoms during Martensitic phase transformations using low energy electron diffraction, and (2) interpretation of vibration of surface atoms in terms of the theory that high amplitude (soft mode) vibration lowers the barrier to nucleation of non-diffusional Martensitic transformations.

SUPPORTED BY U.S. Dept. of Defense, Army Materiel Development & Readiness Command, Army Research Office

8.0035, EXPERIMENTAL STUDY OF THE INITIAL PHASES OF A TOKAMAK DISCHARGE

R.D. Bengtson, University of Texas, Austin Campus, School of Natural Sciences, Dept. of Physics, *200 W. 21st St., Austin, Texas* 78712

This experimental study will be conducted in a research Tokamak with design parameters R equals 53 cm, a equals 16 cm, B equals 10 to 20 KG, I/sub p/ equals 80 to 160 KA, T/sub e/ equals 400 eV, usable pulse length 50 msi. Emphasis will be placed on impurity transport and atomic physics studies of discharge initiation by a variety of techniques. Diagnostics to be installed on the device include 2 and 4 mm microwave Thompson scattering, and a wide variety of spectrometers.

SUPPORTED BY U.S. Dept. of Energy

8.0036, COMPTON SCATTERINGS OF METAL HYDRIDES WITH 412 KEFY - RADIATION

M.J. Cooper, University of Warwick, Dept. of Physics, *Coventry, England, United Kingdom* (DA0D9371; DAERO 78 G0019)

An Au 198 gamma ray source is constructed at Rutherford Laboratory. Dr. J. L. Dubard of the U.S.A. is experienced with similar sources and is to spend a sabbatical year in the U.K. assisting in this Au 198 source. The research itself will center around the sensitivity of the Compton profile to the behavior of hydrogen in metals. The electron momentum density of metals, and particularly metal hydrides, will be measured.

It is anticipated that by using the Au 198 source, two orders of magnitude improvement will be achieved.

10.0001, LABORATORY INVESTIGATION OF THE ORIGIN OF DIFFUSE INTERSTELLAR BANDS

T.J. Wdowiak, Miles College, Undergraduate School, *5500 Ave. G, Birmingham, Alabama* 35208 (RIM78-17825)

The research that will be done is to elucidate the origin of the diffuse interstellar bands by subjecting fused ring organic compounds to temperatures in the range of 10 degrees to 100 degrees K and to ultraviolet radiation. The samples will be examined by absorption spectroscopy. Molecular structures to be investigated will include graphite precursor molecules and conjugated linear molecules thought to be good candidates for the constituents of interstellar dust. A free radical, free electron model fits many of the characteristics of diffuse interstellar bands and will be used as the rationale for the experiments.

SUPPORTED BY U.S. National Science Foundation, Div. of Astronomical Sciences

10.0002, STUDIES OF WHITE DWARF STARS

J.W. Liebert, University of Arizona, Graduate School, *Tucson, Arizona* 85721 (AST7821071)

This project will be devoted to an investigation of the origin and properties of white dwarf stars and pre-white dwarf star evolution. White dwarf stars represent one of the end points of stellar evolution. They are stars of about one solar mass, with radii of about 5,000 kilometers and densities of one ton per cubic centimeter. The research to be carried out on these stars will include detailed analyses based on optical spectrophotometry of hot white dwarf stars. There will be a theoretical investigation of the manner in which stars become white dwarfs.

It is now generally believed that nova take place in binary systems which contain a white dwarf star. The nova occurs when mass is transferred from the companion star onto the white dwarf star. There will be theoretical and observational studies of white dwarf stars in binary stars, with particular attention directed towards the properties of the classical novae, the formation of dust in nova shells, and nova-like variables.

10.0004, GAS IN GALAXIES - ASTROPHYSICAL GAS DYNAMICS

W.G. Mathews, University of California, Santa Cruz Campus, Lick Observatory, *Mount Hamilton, California* 95140 (AST7818220)

Locally, in our own galaxy stars represent the most apparent form of condensed matter. Many of these stars are as old as the galaxy itself. New stars are continuously being formed from rarefield clouds of interstellar matter. Old stars are observed to throw off a significant part of their outer envelopes back into the pool of interstellar gas, enriched with elements produced by nuclear processes within these stars. Studies of the gaseous component of our galaxy have been scientifically fruitful as the gas responds to additional and more subtle forces than of gravity alone, which is the major force acting on the stellar component. Observational and theoretical studies of tenuous gas near stars has revealed the presence of stellar winds similar to the wind from the sun.

In the central nucleus of quasi-stellar (QSOs) and certain remarkable galaxies, the Seyfert galaxies, an enormous energy powerhouse exists which strongly influences the motion of nearby gas.

At present we know very little about exactly how this energy is released, but giant black holes may be responsible for the energy released. Black holes are not directly observed, but violent motions in nearby gas are easily observed. A careful theoretical study of this gaseous component may reveal more about how energy is released at rates unparalleled elsewhere in the known universe.

10.0008, RADIATION TRANSPORT IN SPACE

M.J. Berger, U.S. Dept. of Commerce, National Bureau of Standards, *Washington, District of Columbia* 20228 (2401430)

PROJECT OBJECTIVE: To solve radiation metrology problems arising in space science and technology. To determine response functions of gamma ray and charged particle detectors, and to use them for converting observed pulse height distributions to energy spectra. Application of these techniques to the analysis of data obtained in space experiments.

PROJECT APPROACH: Research involves modeling of detection systems, calculation of energy deposition in detectors by random sampling, to obtain detector response functions. Important additional phase of work involves reconstruction of energy spectra from gamma and charged particle radiation, taking into account response function as well as removal of distortion and background.

SUPPORTED BY U.S. Dept. of Commerce, National Bureau of Standards

10.0009, OBSERVATIONS OF ULTRAVIOLET LINE SPECTRA STARS

R.A. Bell, University of Maryland, College Park Campus, Graduate School, Dept. of Physics & Astronomy, *College Park, Maryland* 20742 (NSG 5399)

10.0010, STELLAR PHYSICS - SOLAR OBSERVATIONS

R.W. Noyes, Smithsonian Institution, Astrophysical Observatory, *60 Garden St., Cambridge, Massachusetts* 02138

This project is an ongoing one, which includes both satellite and ground-based observations. Satellite observations were obtained in 1967 and 1969 from the Orbiting Solar Observatories OSO 4 and OSO 6, by means of extreme ultraviolet spectrometers built by the Harvard College Observatory Solar Satellite Project. The data have opened up a new spectral region to detailed physical analysis and will continue for several years to provide fundamental information on the physics of the solar corona.

In a related program of ground-based observations, the structure of the solar atmosphere near its temperature minimum is being explored, by use of high-resolution infrared (5 micron) spectra of the sun obtained at Kitt Peak National Observatory. These data are being analyzed using an SAO stellar atmospheres program and should provide definitive information on the solar temperature minimum. At the same time, the structure of sunspots is being studied with the same observing equipment.

SUPPORTED BY Smithsonian Institution, Astrophysical Observatory

10.0011, ASTRONOMY RESEARCH AT THE FIVE COLLEGE RADIO ASTRONOMY OBSERVATORY

G.R. Huguenin, University of Massachusetts, Amherst Campus, School of Arts & Sciences, Dept. of Physics & Astronomy, *Amherst, Massachusetts* 01002 (AST7624610A03)

The Five College Radio Astronomy Observatory will pursue three major projects: 1. The very successful program of pulsar observation will be continued. The behavior of pulsars and their motion through space will be determined in an attempt to characterize the emission mechanism, the rate of formation and other attributes of these unusual, highly condensed objects. The meter wave array used for these observations will be enlarged in order to improve the sensitivity and increase the number of observable objects. 2. The 45-foot, radome enclosed, millimeter telescope will be used for studies of the interstellar medium, extragalactic radio sources, and solar system objects.

Development will continue on the application of very low noise maser amplifiers for radio astronomy at millimeter wavelengths. As such receivers become available, they will be put into use on the telescope where it is expected they will provide a ten to fifty-fold increase in sensitivity.

This is a continuation of work previously supported under NSF Grant AST 76-24610.

10.0015, GALACTIC AND EXTRAGALACTIC RESEARCH WITH THE IMPROVED BURRELL SCHMIDT-TYPE TELESCOPE
P. Pesch, Case Western Reserve University, Graduate School, Dept. of Astronomy, *2040 Adelbert Rd., Cleveland, Ohio* 44106 (AST7723063A01)

A variety of astronomy research projects will be undertaken by the staff of the Warner and Swasey Observatory. The projects will include studies of faint nearby stars, luminous stars in the Milky Way Galaxy, and Quasars. The common theme of the projects is the unique capability of a Schmidt telescope equipped with objective-prisms to do faint spectroscopy and surveys of astronomical objects.

One of the new projects is a low-dispersion (1000 A/mm at 6500A) survey of the northern sky in the red region of the spectrum. This survey, to update one last done in the early 1940's at very low resolution, will identify nearby M-type dwarfs, sulfur and carbon-sulfur stars, and objects that emit the hydrogen-alpha lines of the spectrum.

Another new project is a color-independent survey in the northern sky for bright, high-redshift, radio-quiet, quasi-stellar objects (QSO's). Malcolm Smith at Cerro Tololo Inter-American Observatory has shown that a low-dispersion objective-prism can be used to discover high-redshift QSO's independent of color and/or radio characteristics. A survey of this nature is being done by others in the southern hemisphere; a similar survey in the northern sky will be initiated. This is the only known method of obtaining an accurate and unbiased sample of these cosmologically important objects. The continuing projects will include an effort aimed at identification of objects listed in the Air Force Infrared Sky Survey Catalogue. The photoelectric photometry of faint M stars in the direction of both the north and the south galactic poles will be obtained for purposes of determining correctly the space of dwarf M stars. Objective-prism spectral classification of parallax stars, studies of the Magellanic Clouds, and an investigation of radial velocities of stars obtained from Schmidt telescope objective-prism plates will be carried out. This is a continuation of research done under NSF grant AST 77-23063.

Copyright. Avail: Allerton Press Inc., 150 Fifth Ave., N.Y. 10011; $45.00

An approximate approach is proposed for the solution of the problem of the plane stress state of structurally anisotropic panels of variable stiffness and complex planform. Assuming linear variation of the displacement vectors between the computational lines, specified in equation form, the governing system of ordinary difference-differential equations is obtained. The numerical solution of these equations for a panel with three free edges and one clamped edge is examined. Results are presented of calculations for particular cases and they are compared with the solutions available in the literature. J.M.S.

SURFACE-EFFECT COMPONENTS OF AERODYNAMIC CHARACTERISTICS OF AIR-CUSHION VEHICLE WITH RAM PRESSURIZATION c02
M. A. Guryanov *In its* Soviet Aeron., Vol. 21, No. 2 1978 p 10-19 refs Transl. into ENGLISH from Izv. Vyssh. Ucheb. Zaved. Aviats. Tekh. (USSR), v. 21, no. 2, 1978 p 17-29 (For primary document see N80-11002 02-01)
Copyright. Avail: Allerton Press Inc., 150 Fifth Ave., N.Y. 10011; $45.00

Results are presented of theoretical studies of the purely surface-effect components of the aerodynamic characteristics of an air-cushion vehicle consisting of a semitunnel of pi-shaped cross section traveling above a ground plane with translational velocity. A solution establishing the connection between these characteristics and the basic parameters defining the geometric form of the semitunnel and its position relative to the ground plane is obtained. It is shown that the studied vehicle has high aerodynamic efficiency and natural stability with respect to running height and pitch angle, particularly in the region of low semitunnel aspect ratios. Use of the proposed analysis method together with the known methods for determining the aerodynamic characteristics of flight vehicles in out-of-ground-effect flight makes it possible to calculate and optimize in the first approximation the aerodynamic characteristics of surface-effect vehicles and air-cushion aerotrains with ram pressurization. The conformal mapping method was used to construct in the third approximation the equations for determining the abscissa of the conformal center of gravity of a profile, the mapping circle radius, and the points of the circle corresponding to the profile leading and trailing edges. Analytic formulas for the lift and moment coefficients, aerodynamic center and center of pressure coordinates, and profile surface velocity were obtained with accuracy to quantities of fourth order of smallness. An example (cambered lune) calculation shows that the proposed formulas have very high accuracy. R.E.S.

A method for smooth epsilon approximation of a function of many variables with discontinuities of the first order derivatives at the points of some hypersurface is presented. The method makes it possible to represent any function, specified in the region of smoothness by suitable relations, in the form of a differentiable envelope lying in the epsilon vicinity of the original function. An example is given of specification of the aerodynamic characteristics of a wing with two element trailing-edge flap by the envelope. It is shown that the definition of the function epsilon introduced herein makes it possible with existing limits on its magnitude to obtain an approximation accuracy which is adequate for practical calculations. EVALUATION OF A WIND-TUNNEL GUST RESPONSE TECHNIQUE INCLUDING CORRELATIONS WITH ANALYTICAL AND FLIGHT TEST RESULTS
L. Tracy Redd, Perry W. Hanson, and Eleanor C. Wynne Nov. 1979 55 p refs
(NASA-TP-1501; L-1313) Avail: NTIS HC A04/MF A01 CSCL 01A

A wind tunnel technique for obtaining gust frequency response functions for use in predicting the response of flexible aircraft to atmospheric turbulence is evaluated. The tunnel test results for a dynamically scaled cable supported aeroelastic model are compared with analytical and flight data. The wind tunnel technique, which employs oscillating vanes in the tunnel throat section to generate a sinusoidally varying flow field around the model, was evaluated by use of a 1/30 scale model of the B-52E airplane. Correlation between the wind tunnel results, flight test results, and analytical predictions for response in the short period and wing first elastic modes of motion are presented. A.W.H.

A COMPARISON OF THE PITCHING AND PLUNGING RESPONSE OF AN OSCILLATING AIRFOIL Final Report
Franklin O. Carta Washington NASA Oct. 1979 158 p refs (Contract NAS1-14012)
(NASA-CR-3172) Avail: NTIS HC A08/MF A01 CSCL 01A

An oscillating SC1095 airfoil model was tested for its aerodynamic stability in a rigid body with a single degree of freedom pitch about its quarter chord, and also in a rigid body with single degree of freedom plunge. The ability of pitching data to model plunging motions was evaluated. A one to one correspondence was established between pairs of pitching and plunging motions according to the potential flow transformation formula alpha = ikh. The imposed variables of the experiment were mean incidence angle, amplitude of motion, free stream velocity, and oscillatory frequency. Results indicate that significant differences exist between the aerodynamic responses to the motions, particularly at high load conditions. At high load conditions, the normal force for equivalent pitch is significantly greater than that for true pitch at the geometric incidence angle. R.C.T.

AIRCRAFT CONTROL BY PROPELLER CYCLIC BLADES
John DeYoung Washington NASA Nov. 1979 61 p refs (Contract NAS1-13500)
(NASA-CR-3212) Avail: NTIS HC A04/MF A01 CSCL 01A

A theory is developed for aircraft control obtained from the propeller forces and moments generated by blade angle variation during a blade revolution. The propeller blade is pitched harmonically one cycle per propeller revolution which results in vehicle control forces and moments, termed cyclic-control. Using a power series respresentation of an arbitrary function of cyclic-blade angle, cyclic-control theory is developed which leads to exact solutions in terms of derivatives of steady-state thrust and power with respect to blade angle. An alternative solution, when the cyclic-blade angle function is limited to a sinusoidal cycle, is in terms of Bessel functions. An estimate of non-steady azimuth angle change or lag is presented. Cyclic-control analysis applied to the counter-rotating propeller shows that control forces or moments can be uniquely isolated from each other. Thus the dual rotor, in hovering mode, has propulsion without rotor tilt or moments, or, when in propeller mode at the tail of an air ship or submarine, vehicle control with no vehicle movement. Control isolation is also attainable from three or more propellers in-line. Author

PREDICTION OF HELICOPTER ROTOR DOWNWASH IN HOVER AND VERTICAL FLIGHT
K. R. Reddy Jan. 1979 31 p refs
(ARL-AERO-Rept-150; AR-001-335) Avail: NTIS HC A03/MF A01

A vortex-wake method to calculate the rotor downwash in hovering and vertical flight is presented. The blade is represented by a lifting line. The rotor wake is simulated by a vortex sheet and a series of rolled up root and tip vortices, similar in form to that of a classical fixed wing. The concept of rectangularization of the rotor wake is used in obtaining a formula for the normal component of induced velocity. Wake contraction based on experimental data is introduced into the calculations. Numerical calculations are performed for two rotor configurations. Computed induced velocities and blade loadings are compared with the available flight data. A.W.H.

Low subsonic and incompressible wake flow downstream of lightly loaded rotor was studied. Measurements of mean velocity, turbulence intensity, Reynolds stress, and static variations across the rotor wake at various axial and radial locations were investigated. Wakes were measured at various rotor blade incidences to discern the effect of blade loading on the rotor wake. Mean velocity and turbulence measurements were carried out with a triaxial hot wire probe both rotating with the rotor and stationary behind the rotor. Results indicate that increased loading slows the decay rates of axial and tangential mean velocity defects and radial velocities in the wake. The presence of large radial velocities in the rotor wake indicate the extent of the interactions between one radius and another. Appreciable static pressure variations across the rotor wake were found in the near wake region. Similarity in the profile shape was found for the axial and tangential components of the mean velocity and in the outer layer for axial, tangential, and radial turbulence intensities. R.C.T.

FLIGHT-MEASURED AFTERBODY PRESSURE COEFFICIENTS FROM AN AIRPLANE HAVING TWIN SIDE-BY-SIDE JET ENGINES FOR MACH NUMBERS FROM 0.6 TO 1.6
Louis L. Steers Washington Nov. 1979 88 p refs
(NASA-TP-1549; H-1066) Avail: NTIS HC A05/MF A01 CSCL 01A

Afterbody pressure distribution data were obtained in flight from an airplane having twin side-by-side jet exhausts. The data were obtained in level flight at Mach numbers from 0.60 to 1.60 and at elevated load factors for Mach numbers of 0.60, 0.90, and 1.20. The test altitude varied from 2300 meters (7500 feet) to 15,200 meters (50,000 feet) over a speed range that provided a matrix of constant Mach number and constant unit Reynolds number test conditions. The results of the full-scale flight afterbody pressure distribution program are presented in the form of plotted pressure distributions and tabulated pressure coefficients with Mach number, angle of attack, engine nozzle pressure ratio, and unit Reynolds number as controlled parameters. EXPERIMENTAL STUDY OF LOW ASPECT RATIO COMPRESSOR BLADING
Lonnie Reid and Royce D. Moore 1979 19 p refs Proposed for presentation at the 25th Ann. Intern. Gas Turbine Conf., New Orleans, La., 9-13 Mar. 1980; sponsored by Am. Soc. of Mech. Engr.
(NASA-TM-79280; E-217) Avail: NTIS HC A02/MF A01 CSCL 01A

The effects of low aspect ratio blading on aerodynamic performance were examined. Four individual transonic compressor stages, representative of the inlet stage of an advanced high pressure ratio core compressor, are discussed. The flow phenomena for the four stages are investigated. Comparisons of blade element parameters are presented for the two different aspect ratio configurations. Blade loading levels are compared for the near stall conditions and comparisons are made of loss and diffusion factors over the operating range of incidence angles. A.W.H.

LEADING EDGE VORTEX-FLAP EXPERIMENTS ON A 74 DEG DELTA WING
Dhanvad M. Rao Nov. 1979 53 p refs
(Grant NsG-1315)
(NASA-CR-159161) Avail: NTIS HC A04/MF A01 CSCL 01A

Exploratory wind tunnel tests are reported on a 74 deg. delta wing model. The potential of a vortex flap concept in reducing the subsonic lift dependent drag of highly swept, slender wings is examined. The suction effect of coiled vortices generated through controlled separation over leading edge flap surfaces to produce a thrust component is discussed. A series of vortex-flap configurations were investigated to explore the effect of some primary geomtric variables. A.W.H.

This report covers an experimental investigation of the symmetric body vortex wake of a circular cylinder in supersonic flow. Flow field measurements were made in the cross-flow plane at various axial body stations for angles of attack from 10 to 25 degrees. Data were obtained for two Reynolds numbers at a freestream Mach number of 2 and for one Reynolds number at a freestream Mach number of 3. A conical pressure probe was used to measure total pressure, Mach number, and three orthogonal velocity components at a large number of grid points in each of the survey planes. The pitch and yaw angles of the probe were manipulated in the wind tunnel in order to minimize any probe interference effects on the body vortex. A new experimental technique was used which involved the interaction of a theoretical predictive technique, a computer driven probe, and real time data quality optimization. Results are presented for the distribution of total pressure, Mach number, cross-flow velocity field, and axial velocity component in the cross-flow plane. These quantities are further processed to infer the position of the primary body vortex in the cross-flow plane, local circulation distribution in the cross-flow plane, vortex core size, wake height, and total circulation in the cross-flow plane. THE ANALYSIS OF WING-BODY COMBINATIONS AT MODERATE ANGLES OF ATTACK

N. Uchiyama (Japan Defense Agency, Tokyo), R. P. Mikkilineni, and J. M. Wu. 1978. 7 p. refs. Presented at the AIAA 16th Aerospace Sci. Meeting, Huntsville, Ala., 16-18 Jan. 1978.
(Contract DAAG29-77-G-0108)
(AD-A074284; ARO-14966.1-A-E) Avail: NTIS HC A02/MF A01 CSCL 20/4

A computational scheme is developed to predict the flow over wing-body combinations at moderate angles of attack and the results of computation are presented for two different wing-body combinations. The wing is represented by a system of discrete non-intersecting vortex lines. Each vortex line in the wake is composed of a series of straight finite segments and a semi-infinite segment. The body is represented by a system of source/sink elements distributed on the surface of the body. The effect of lifting nose is taken into account by a horseshoe vortex system, the strength and the location of which are based on the empirical relations. The basic unknowns in the problem are the strengths of the vortex elements and the source/sink elements, and the direction of the vortex elements in the wake. The problem is solved using an iterative approach. The shape of the trailing vortex sheet is shown at different stations along the body. A.R.H.

(AD-A071418; AE-79-1) Avail: NTIS HC A05/MF A01 CSCL 20/4

Direct numerical simulation of complex gas dynamics problems (computational experiment) is performed with the help of Euler, Navier-Stokes and Boltzmann equations. The basic principles of the computational experiment are formulated and the results for various gas dynamics problems of a complex internal structure are presented. The problems examined include the transonic regime (super-critical flows including transition through sound velocity), flows with a jet injected into the main stream and diffraction problems. Body wake flows are studied at various Reynolds numbers. The structure of a shock wave provides an example of rarefied gas flows at various Mach numbers. A set of control tests is worked out for the estimation of calculation accuracy. GRA

The base pressure associated with supersonic axisymmetric flow past a backward facing step, employing previously developed analysis of recompression, reattachment, and redevelopment processes, has been calculated for small supersonic approaching flow Mach numbers with thin initial boundary layers. The model of dealing with transonic flow past a backward facing step in two-dimensional or axisymmetric configuration has been successfully developed. Large scaled calculations of the turbulent Navier-Stokes equation based on the 'two-equation model', has been carried out for the low speed flow past a two-dimensional backstep, where a considerable amount of hot-wire data is available for compression and good description of the overall flow pattern has been obtained. Numerical calculations of the potential flow after hodograph transformation have been proved to be fruitful by solving many previously unsolved problems where the effect of gravitation predominates. (UCRL-82012; Conf-781197-1) Avail: NTIS HC A02/MF A01

Voitenko compressors were used to generate approximately 4.5 cm/micron sec air shocks in a steel and a grout outlet pipe. Diaphragm burst times and time-of-arrival data of shock-front luminosity along the 2 cm i.d. exit pipes are provided by fiber-optics ports. Pressure profiles were obtained for this high enthalpy shock propagation at many locations in both experiments. The effect of wall material on high-energy shock propagation was investigated. In the interval between 10 and 250 cm from the diaphragm the velocity and peak pressure of the shock front attenuated from approximately 4.5 to 0.5 cm/micron sec and approximately 21 to approximately 0.2 kb, respectively. Over this distance, the shock propagation gave nearly identical results for both experiments within the range of experimental accuracy. This rapid attenuation of the shock front velocity and pressure is attributed to ablation and entrainment of wall material. Results indicate that the shock propagation is independent of wall composition to the extent of materials considered over the 250 cm distance of the outlet pipes. DOE

MEASUREMENTS ON A THREE-DIMENSIONAL SWEPT WING AT LOW SPEEDS. PART 1: THE FLOW AROUND THE LEADING EDGE
Arild Bertelrud. Sep. 1977. 112 p. refs. Sponsored by Swed. Defence Mat. Admin. 2 Vol.
(FFA-130-Pt-1; PB-294203/5) Avail: NTIS HC A06/MF A01

As a part of a project on extrapolation from wind tunnel to flight, measurements in the boundary layer of a three dimensional swept wing were made in a low speed wind tunnel. The flow in the region close to the leading edge was studied. Two different flow patterns were investigated; natural transition and bubble transition. The wing tested is outer part of the actual wing of a SAAB 32 Lansen with a NACA 64A010 profile normal to the 25 percent line and a leading edge sweep of 39 deg. It is found that for the present wing the pressure distribution in the leading edge region back to 30 percent of the chord is well described by two-dimensional calculations of attack close to start of separation the attachment line flow probably becomes transitional/turbulent in the tested speed range, followed by relaminarization and bubble. According to calculations there should not be relaminarization in the flight case, despite strong indications from earlier flight tests of bubble separation. Author (ESA)

MEASUREMENTS ON A THREE-DIMENSIONAL SWEPT WING AT LOW SPEEDS. PART 2: THE FLOW IN THE BOUNDARY LAYER ON THE MAIN WING
Arild Bertelrud. Sep. 1977. 85 p. refs. Sponsored by Swed. Defence Mat. Admin. 2 Vol.
(FFA-131-Pt-2; PB-294204/3) Avail: NTIS HC A05/MF A01

As a part of a project on extrapolation from wind tunnel to flight, measurements in the boundary layer of three-dimensional swept wing were made in a low speed tunnel. The flow on the main part of the wing is discussed and essentially time-averaged information is given. The experimental investigation consists of measurements of the static distribution and also of measurements with total head/static probes. These also provide skin friction data. As the flow visualizations and the preliminary measurements indicated that the flow was close to two dimensional, boundary layer rakes were used to get streamwise information on the boundary layer profiles. Calculations of the static pressure distribution and the turbulent boundary layer characteristics were performed and show good agreement with the experimental results. Author (ESA)

COMPARISON OF BOUNDARY LAYER CALCULATION FOR A WING: THE MAY 1978 STOCHOLM WORKSHOP TEST CASE
D. A. Humphreys. Jan. 1979. 121 p. refs.
(FFA-AE-1522) Avail: NTIS HC A06/MF A01

Eight calculation methods for determining three-dimensional turbulent boundary layers were compared. All methods were applied to the same test case which was designed to simulate flow over a wind tunnel model wing. Geometry and free stream

conditions were chosen to be representative, yet to yield a relatively simple compressible (subsonic) boundary layer with only moderate three-dimensionality and spanwise variation. Wing root, tip, and leading edge regions were excluded. Two wing incidences were considered. The main comparison of the calculation methods involved comparing four parameters appearing in the integral equations of motion in streamline coordinates. Despite the simplicity of the test case, disproportionately large differences were evident among the outputs of the eight programs (as much as 10 percent or 20 percent typically). Possible explanations for these discrepencies are suggested. Author (ESA)

AN EXPERIMENTAL SURVEY OF A SEPARATED REGION ON A CONICAL AFTERBODY IN A SUPERSONIC FREE STREAM Final Report
Johan Agrell. Oct. 1978. 24 p. refs
(Contract FMV-F-VT-81713-74-013-07-001)
(FFA-TN-AU-1187) Avail: NTIS HC A02/MF A01

The separated flow region on a boat-tailed afterbody was investigated experimentally at a Mach number of 2.00 during wind tunnel tests. The size of the reversed flow region was determined and, where possible, the velocity of the recirculating flow was estimated. Experimental methods comprised different types of pressure probes and flow visualization techniques. Despite the shortcomings of the method qualitative profiles of the local Mach number in the reverse flow were obtained. Author (ESA)

PITOT PRESSURE AND TOTAL TEMPERATURE PROFILE MEASUREMENTS IN A HYPERSONIC, TURBULENT BOUNDARY LAYER AT M = 9
R. P. Bartlett, A. J. Edwards, J. K. Harvey, and R. Hilier. Feb. 1979. 36 p. refs
(Contract AT/2037/084)
(IC-Aero-79-01) Avail: NTIS HC A03/MF A01

Pitot pressure and total temperature profiles were measured in a zero pressure gradient, turbulent, hypersonic boundary layer under conditions of severe cooling. Velocity profiles were calculated and compared with several available velocity - total temperature relationships. The van Driest transformation was used to compare the data with well-known incompressible results. Results and estimates of the wake component suggested the boundary layer was not fully developed. A SURVEY OF THE LITERATURE ON SURFACE ROUGHNESS EFFECTS ON THE DRAG OF SUBSONIC AIRCRAFT Final Report
A. Bertelrud. Sep. 1978. 131 p. refs
(Contracts SWEDBTD-75-4494; SWEDBTD-76-4505)
(FFA-AU-1224) Avail: NTIS HC A07/MF A01

A survey of selected investigations concerning drag associated with isolated or distributed roughness elements in laminar and turbulent flow is given. Basic roughness types tested in laboratory experiments are covered and the results are related to conditions on wings of subsonic aircraft. Whereas considerable information is available on zero-pressure-gradient two-dimensional turbulent flows with roughness effects can be incorporated in current routines for assessing overall drag of aircraft based on wind tunnel and flight tests is demonstrated. It is suggested to develop a computer code which will allow the determination of allowable roughness size, or the effect of given roughness size on drag for new aircraft. This program would also make possible predictions of the degradation in performance associated with maintenance procedures, structural modifications, etc. Such a program involves a detailed analysis of the flow field around wing and body instead of the over-simplified methods based on flat plate relations now in use. CABIN HAZARDS FROM A LARGE EXTERNAL FUEL FIRE ADJACENT TO AN AIRCRAFT FUSELAGE **Final Report**
Louis J. Brown, Jr. Aug. 1979. 59 p. refs.
(FAA Proj. 181-521-100)
(AD-A073494; FAA-NA-79-27) Avail: NTIS HC A03/MF A01 CSCL 13/12

Fourteen fire tests were conducted with a surplus, fire hardened DC 7 fuselage. The flame penetration and resulting accumulation of heat and smoke inside an aircraft cabin, produced by a large external fuel fire adjacent to a fuselage door opening, was measured and studied. Temperatures, light transmittances, and heat fluxes were measured. The effect of wind direction and velocity on the flame propagation and penetration were investigated. A.W.H.

AIRCREW DISPLAYS AND AVIONICS FOR APPLICATION IN A FUTURE NATIONAL AIRSPACE SYSTEM
Seymour Salmirs. Nov. 1979. 28 p. refs.
(NASA-TM-80095) Avail: NTIS HC A03/MF A01 CSCL 01D

A concept for increased pilot involvement in a future National Airspace System was evolved during the FAA New Initiatives in Engineering and Development Users responsibilities and ways in which they might interact. The technical feasibility of the system is indicated by the sophisticated level of presently manufactured digital computers and display avionics, and the application of that technology under design by the major airframe manufacturers. Data collected during simulations and flights with the Terminal Configured Vehicle Program B-737 airplane are shown to have direct application to the new system concept. The adoption of the operational changes envisioned, offers some potentially significant advantages to the user. Author

MULTICIRCLE CARGO AIRCRAFT OPTIONS AND CONFIGURATIONS
D. William Conner and John C. Vaughan, III (USAF). Oct. 1979. 15 p. refs. Presented at 1979 SAE Aerospace Meeting, 3-9 Dec. 1979.
(NASA-TM-80177) Avail: NTIS HC A02/MF A01 CSCL 01C

A future requirements and advanced market evaluation study indicates derivatives of current wide-body aircraft, using 1980 advanced technology, would be economically attractive through 2008, but new dedicated airfreighters incorporating 1990 technology, would offer little or no economic incentive. They would be economically attractive for all payload sizes, however, if RD and T costs could be shared in a joint civil/military arrangement. For the 1994-2008 cargo market, option studies indicate Mach 0.7 propfans would be economically attractive in trip cost, aircraft price and airline ROI. Spanloaders would have an even lower price and higher ROI but would have a relatively high trip cost because of aerodynamic inefficiencies. Dedicated airfreighters using propfans at Mach 0.8 cruise, laminar flow control, or cryofuels, would not provide any great economic benefits. Air cushion landing gear configurations are identified as an option for avoiding runway constraints on airport requirements and/or operational constraints are noted. Author

EJECTION SEAT FOR HIGH G ESCAPE **Final Technical Report, 1 Jun. 1978 - Apr. 1979**
Orville E. Howland. Apr. 1979. 184 p. refs.
(Contract F33615-78-C-3416; AF Proj. 2402)
(AD-A072444; MDC-J8434; AFFDL-TR-79-3044) Avail: NTIS HC A09/MF A01 CSCL 06/7

Advanced flight vehicles operating at acceleration loads beyond human functional capabilities require a new reclining seat design. An ejection seat compatible with this requirement must provide safe ejection and aircraft clearances under high-G conditions as well as the requirements associated with high dynamic pressures and low altitudes. Design criteria and interface requirements have been established. Ejection seat subsystems have been developed and seat design concepts generated to meet criteria and interface requirements. Candidate seat concepts have been analyzed to determine cockpit integration effects, accelerations, ejection clearances, escape performance, structural requirements and weights. A final design concept has been selected to meet all requirements of an ejection seat for high-G escape. The final report includes a parametric study of tail clearances and discusses technical design details and conclusions of the work performed. GRA

EXPLORATORY DEVELOPMENT OF AIRCREW WINDBLAST PROTECTION CONCEPTS **Final Report, May 1978 - Jan. 1979**
Robert J. Cummings and Frank E. Drsata. Jun. 1979. 100 p. refs.

(Contract F33615-78-C-0514; AF Proj. 7231)
(AD-A072013; RI/LAD-NA-79-77; AMRL-TR-79-16) Avail: NTIS HC A05/MF A01 CSCL 06/7

Design requirements for windblast limb protection systems to be used in current ejection seats were defined. The ACES II system was used as a baseline system. Using the baseline seat and the requirements, three arm and three leg restraint concepts were defined. A proposed program was then defined to evaluate and develop the proposed systems. Design requirements were derived from a list of criteria or constraints for the system as defined in the reference to the escape, aircraft, crew flight conditions and using commands' needs. Resulting requirements were then rank ordered and significant interactions between them identified. Identification of negative interactions highlights the significant trades necessary to design a successful windblast protection system. Ejection events and the resulting environment the crew is exposed to were then analyzed to define the physical actions the man and system must contend with. Review of previous ejection injuries and limb restraint systems was included to further refine the understanding of injury mechanisms. Specific injury mechanisms of the knees, shoulder, elbow, and spinal column are presented. Using the requirements and injury mechanisms the six candidate protection systems were defined. A proposed program for concept refinement and final selection is presented. GRA

LIFE RAFT STUDY, FEBRUARY 1978
R. W. Scobie and D. L. Thompson. Apr. 1979. 33 p. refs
(AD-A073055; CGOU-TR-79-1) Avail: NTIS HC A03/MF A01 CSCL 06/7

A life raft study was conducted from the CGC EVERGREEN in February 1978. Of the six life rafts tested, only one was seen capsizing. The Givens life raft suffered the most damage with both the canopy and ballast bag being destroyed. Leeway for life rafts with improved ballast systems was found to follow the equation Uliferaft = 0.042 Uwind + 0.060. This type of life raft was noted to drift at a much slower rate when the canopy was not deployed. In over 80% of the cases the life rafts drifted within 45 degrees of the downwind direction. GRA

AN ASSESSMENT OF TERMINAL AIR TRAFFIC CONTROL SYSTEM PERFORMANCE WITH AND WITHOUT BASIC METERING AND SPACING AUTOMATION Final Report
H. C. Wintermoyer, William Pailen, and Donald Meyer. Mar. 1979. 134 p. refs
(Contract DOT-FA79WAI-012)
(AD-A073548; FAA-RD-79-81) Avail: NTIS HC A07/MF A01 CSCL 17/7

Basic arrival metering and spacing (M&S), developed as an ARTS (automated radar terminal system) 3 enhancement, is discussed. The functions of metering arrival aircraft prior to their acceptance in terminal airspace, sequencing them according to their estimated time at the runway, scheduling each aircraft at fix points along the arrival path to the runway arrival gate, and providing control commands to assure precise and proper spacing for aircraft on final approach to the runway are examined. Simulation tests to determine the landing time interval error, the potential safe landing rate, and the potential excessive delay are described. A.W.H.

STUDY FOR INCORPORATING TIME-SYNCHRONIZED APPROACH CONTROL INTO THE CH-47/VALT DIGITAL NAVIGATION SYSTEM
Walter J. McConnell, Jr. Oct. 1979. 226 p. refs
(Contract NAS1-14238)
(NASA-CR-159151) Avail: NTIS HC A11/MF A01 CSCL 17G

Techniques for obtaining time synchronized (4D) approach control in the VALT research helicopter is described. Various 4D concepts and their compatibility with the existing VALT digital computer navigation and guidance system hardware and software are examined. Modifications to various techniques were investigated in order to take advantage of the unique operating characteristics of the helicopter in the terminal area. A 4D system is proposed, combining the direct to maneuver with the existing VALT curved path generation capability. A.W.H.

FALCONFIX: A MULTI-MODAL APPROACH TO FIX COMPUTATION Final Report
William T. Hodson, III and Joseph C. H. Smith. Jun. 1979. 77 p.
(AD-A072527; USAFA-TR-79-5) Avail: NTIS HC A05/MF A01 CSCL 17/3

FALCONFIX is a new algorithm for computing the location of an emitter given the bearings from a number of direction-finding stations located worldwide. This approach assumes that each reported bearing may be considered as a sample from a composite normal/uniform distribution, thereby explicitly acknowledging that the bearing may be either true or wild. These distributions are used to create a likelihood function defined over the unit sphere. Non-linear programming techniques are then employed to identify all relative maxima (modes) of this function. The modes (which coincide with concentrations of bearings) are then ordered by value and reported as estimates of the emitter location. GRA

LIMS: LASER INERTIAL MEASUREMENT SYSTEM Final Report
Jul. 1978. 18 p.
(Contract DAAK40-76-C-0665)
(AD-A072389) Avail: NTIS HC A02/MF A01 CSCL 17/7

Acceptance and delivery of the items described was accomplished. A summary acceptance test report was provided for each LIMU delivered. The anomalies and/or failures during these acceptance test were primarily due to remaining hardware development problems and procedure development problems, not unusual for new items. After these developmental problems were solved, the LIMU's capability of meeting the requirements established for it, was adequately demonstrated as evidenced by the fact that the last four acceptance tests were accomplished in a 2 month interval and were routine in nature. EVALUATION OF DAIS TECHNOLOGY APPLIED TO THE INTEGRATED NAVIGATION SYSTEM OF A TACTICAL TRANSPORT Final Report, Sep. 1977 - May 1979
Donald Dewey, Richard Bousley, Stephen Behnen, and James Mason. May 1979. 181 p. refs
(Contract F33615-77-C-1233; AF Proj. 2003)
(AD-A073068; AFAL-TR-79-1061) Avail: NTIS HC A09/MF A01 CSCL 17/7

This effort has provided an independent contractor assessment of the DAIS executive software, industry exposure to the J-73 level one compiler and DAIS software development tools, and a definition of the interface between DAIS and integrated navigation systems. A combination of INS, GPS and air data was used to demonstrate the usefulness of the DAIS/integrated navigation system for tactical air drop and terminal area operations w/transport aircraft. A Boeing Aerospace Lab Simulation jointly managed by AFAL and Boeing, was conducted for the purposes of evaluating the DAIS/integrated navigation system software performance capabilities in a simulated tactical air drop and terminal area navigation flight profile. A 'Hot Bench' simulation was conducted using contractor developed sensor software modules and navigation filter, and the DAIS executive software and processing hardware. Outputs of the program include: Verification of the overall DAIS concept, measurements of

executive software overhead and suggestions for improving the DAIS executive software. GRA

A HYDRAULIC ACTUATOR MECHANISM TO CONTROL AIRCRAFT SPOILER MOVEMENTS THROUGH DUAL INPUT COMMANDS Patent Application
Stephen C. Irick, inventor (to NASA) Filed 17 Aug. 1979 11 p
(NASA-Case-LAR-12412-1; US-Patent-Appl-SN-067595) Avail: NTIS HC A02/MF A01 CSCL 10C

A conventional, primary spoiler control system retains its operational characteristics while accommodating a secondary input controlled by a conventional computer system to supplement the settings made by the primary input. This is achieved by interposing springs between the primary input and the spoiler control unit. The springs are selected to have a stiffness intermediate to the greater force applied by the primary control linkage and the lesser resistance offered by the spoiler control unit. Thus, operation of the primary input causes the control unit to yield before the springs, yet, operation of the secondary input, acting directly on the control unit, causes the springs to yield and absorb adjustments before they are transmitted into the primary control system. FUEL MINIMAL TAKE-OFF PATH OF JET LIFT VTOL AIRCRAFT, LOG NO. C3558
Hiroshi Nishimura 7 Aug. 1979 40 p refs Backup document for AIAA synoptic scheduled for publication in Journal of Aircraft on Feb. 1980
Avail: NTIS HC A03/MF A01

The fuel minimal take-off path analysis for jet lift type VTOL aircraft is presented. The study is made of two basic configurations, namely, separate type and swivel type. The fuel minimal take-off path problems of the two configurations are analyzed as nonlinear systems with the controls constrained by their magnitude. The solutions for both types are generally composed of two or three discontinuous segments connected by switching points. For the separate type, the singular part is analytically deterministic and unique, and plays a decisive role; but for the swivel type, the singular part is not unique. Two methods of solution involving different handling of singular parts are considered. Author

NOISE OF A MODEL HELICOPTER ROTOR DUE TO INGESTION OF TURBULENCE Final Report
Robert W. Paterson and Roy K. Amiet Nov. 1979 131 p refs
(Contract NAS1-15094)
(NASA-CR-3213) Avail: NTIS HC A07/MF A01 CSCL 01C

A theoretical and experimental investigation of the noise of a model helicoper rotor due to ingestion of turbulence was conducted. Experiments were performed with a 0.76 m dia. articulated model rotor for a range of inflow turbulence and rotor operating conditions. Inflow turbulence levels varied from approximately 2 to 19 percent and tip Mach number was varied from 0.3 to 0.52. Test conditions included ingestion of a atmospheric turbulence in outdoor hover as well as ingestion of grid generated isotropic turbulence in the wind tunnel airstream. In wind tunnel testing, both forward flight and vertical ascent (climb) were simulated. Far field noise spectra and directivity were measured in addition to incident turbulence intensities, length scales, and spectra. Results indicate that ingestion of atmospheric turbulence is the dominant helicopter rotor hover noise mechanism at the moderate to high frequencies which determine perceived noise level. R.C.T.

APPLICATION OF MODIFIED PROFILE ANALYSIS TO FUNCTION TESTING OF SIMULATED CTOL TRANSPORT

TOUCHDOWN-PERFORMANCE DATA
Russell V. Parrish and Burnell T. McKissick Nov. 1979 19 p refs
(NASA-TP-1541; L-13091) Avail: NTIS HC A02/MF A01 CSCL 01C

The modification to the methodology of profile analysis to accommodate the testing of differences between two functions with a single test, rather than multiple tests at various values of the abscissa, is described and demonstrated for two sets of simulation-performance data. The first application was to a flight-simulation comparison of pilot-vehicle performance with a three-element refractive display to performance with a more widely used beam-splitter-reflective-mirror display system. The results demonstrate that the refractive system for out-the-window scene display provides equivalent performance to the reflective system. The second application demonstrates the detection of significant differences by modified profile-analysis procedures. This application compares the effects of two sets of pitch-axis force-feel characteristics on the sink rate at touchdown performance utilizing the refractive system. This experiment demonstrates the dependence of simulator sink-rate performance on force-feel characteristics. Author

DESIGN OF THE SPAR-WINGSKIN JOINT Final Report, 1 Sep. 1977 - 15 Dec. 1978
Ralph D. Cope and R. Byran Pipes Wright-Patterson AFB, Ohio Air Force Flight Dynamics Lab. Mar. 1979 188 p refs
(Contract F33615-77-C-3132; AF Proj. 2401)
(AD-A072426; AFFDL-TR-79-3015) Avail: NTIS HC A09/MF A01 CSCL 13/5

A variety of spar-wingskin joint concepts were investigated to optimize out-of-plane strength while still providing low weight and ease of fabrication. The spar-wingskin configuration consists of a thin spar which overlaps and is co-cured perpendicular to a thick wingskin. Investigation parameters were the joint geometry in the immediate vicinity of the base of the spar, and the spar-to-spar spacing. It was found that by varying the overlap geometry and decreasing the interspar spacing, a significant increase in out-of-plane strength could be realized. A theoretical analysis was made by the extended use of the finite element technique. Joint strength was predicted through the application of Tsai-Wu and maximum stress failure criteria. These results were verified by comparison to experimental results in which all significant concepts were fabricated and tested. GRA

PREDICTION OF LATERAL AERODYNAMIC LOADS ON FIGHTER AIRCRAFT AT HIGH ANGLES OF ATTACK Summary Technical report, 1 May 1977 - 31 Jul. 1978
S. B. Spangler and S. C. Perkins, Jr. 31 Jul. 1978 86 p refs
(Contract N00014-74-C-0344)
(AD-A071893; NEAR-TR-173; ONR-CR212-225-4F) Avail: NTIS HC A05/MF A01 CSCL 20/4

This report presents a brief summary of methods and experimental data developed over a four year period, to predict the static lateral forces acting on a modern fighter-type aircraft at high angles of attack, and small angles of sideslip characteristic of a departure flight attitude. The major part of the report is devoted to application of the methods to two aircraft configurations on which detailed data exist, comparison of the predicted and measured results, and evaluation of the comparisons. The configurations are a research V/STOL fighter configuration and the F-5 aircraft. Comparisons are made on nose vortex positions, circulation distributions in the separated region above the nose, flow velocities in the same region, and loads on the nose alone and complete configuration. Generally, the methods predict all of the correct behavior of these highly nonlinear and complicated flows. However, the agreement in many cases is not sufficiently good to consider the methods as satisfactory design or analysis techniques. Additional work is suggested to provide further verification and improvements. GRA

HEIGHT OF SPRAY PRODUCED BY VERTICAL TAKEOFF AND LANDING (VTOL) AIRCRAFT
Richard E. Kuhn Apr. 1979 30 p refs
(Contract N00167-78-M-2599)
(AD-A073099; DTNSRDC/ASED-79/04) Avail: NTIS HC A03/MF A01 CSCL 01/2

The flow phenomenon involved in the production of spray by a vertical takeoff and landing aircraft hovering over smooth water is examined, and a method for predicting spray height is developed from a correlation of the limited amount of large-scale data available. The method is limited to conditions where the spray height does not exceed the nozzle or rotor height and includes VTOL concepts ranging from the helicopter to jet VTOL'S. Application of the method shows that the spray height is primarily dependent on the operating weight of the aircraft and is only slightly dependent on the disk loading. GRA

A METHOD FOR EVALUATING AIRCRAFT TAKE-OFF PERFORMANCE [UN METODO PER LA VALUTAZIONE DELLE PRESTAZIONI DEI VELIVOLI]
C. Casarosa, A. Mancino, and N. Motroni. Jun. 1978. 74 p. refs. In ITALIAN; ENGLISH summary.
(Contracts CNR-76-00442.07; CNR-76-01620.07)
(Rept-1663; AIA-78-1) Avail: NTIS HC A04/MF A01

A theoretical method and a computation program for aircraft takeoff performance evaluation are presented. The method is based on the integration of the center of gravity motion equation and allows for the evaluation of takeoff performance in function of the main aerodynamic and propulsive characteristics of the aircraft as well as of the takeoff procedure used. Performance evaluation in the case of critical engine failure after a critical point is also possible. The method was tried for the takeoff performance evaluation of a typical executive aircraft having two turbojet engines. Theoretical results were compared with experimental ones and good agreement is shown. Results show that the use of this computerized simulation method for determining aircraft to airfield compatibility is reliable.

AIRCRAFT ROLLING RESISTANCE IN LOOSE, DRY SNOW: A THEORETICAL ANALYSIS
Mats Lidstroem. 1979. 40 p. refs. Sponsored by Natl. Swed. Civil Aviation Admin.
(VTI-173-A) Avail: NTIS HC A03/MF A01

In order to provide data on the rolling resistance of aircraft in dry, loose snow, measurements using an aircraft tire and an ASTM-tire were carried out. In order to be able to predict the rolling resistance as a function of aircraft speed, static wheel load, snow density, and snow depth, with the presented measurements as base, a complementary theoretical predictive model was derived. Finally, after comparing theory and practical measurements, a formula for the determination of the rolling resistance as a function of aircraft and snow parameters is suggested.

(Contract DAAB07-78-C-2445; DA Proj. 1L1-62202-AH-85)
(AD-A071743) Avail: NTIS HC A11/MF A01 CSCL 09/2

The objective of the Avionic System Architecture Investigation (AVSAR II) was to investigate the extent to which multiplex technology and integrated control/display techniques could be applied to the AH-1S Night Cobra (Step 4). The primary purpose of the study was to determine if the integration of a multiplex data bus system would have a significant impact on aircraft system weight. Secondary objectives were to determine whether a reduction of crew workload and a reduction of cockpit real estate requirements could be effected through implementation of the new architecture. This technical report describes the system analysis, system definition, and system integration considerations that resulted in a Step 4 Night Cobra avionic system with integrated controls/displays and a multiplex data bus.

A FAULT TOLERANCE ASSESSMENT OF DAIS. Final Report, Sep. 1978 - Mar. 1979
Walter L. Heimerdinger and Karl M. Fant. Mar. 1979. 128 p. refs.
(Contract F33615-77-C-1232; AF Proj. 2003)
(AD-A072450; HONEYWELL-79SRC13; AFAL-TR-79-1007)
Avail: NTIS HC A07/MF A01 CSCL 09/2

A functional/graphical approach is used to assess the fault tolerance of the Digital Avionics Information System (DAIS), a real-time federated multicomputer digital avionics system. Two separate assessments are made; first, the functional/graphical approach is used to assess the fault tolerance of the DAIS architecture, then the utility of the functional/graphical approach itself is considered. The functional/graphical approach used has two complementary aspects: a functional characterization

of fault phenomena, and a graphical approach to the representation of system behavior, both for normal operations and in response to faults. The graphical representation used is based on the LOGOS system description schema, which uses two associated graphs, a control graph and a data graph, to represent a process or activity. The study extends earlier functional/graphical studies of individual, isolated fault tolerance mechanisms, to the assessment of a complex large scale digital system. The assessment begins by modeling top level DAIS control functions and includes DAIS master executive functions and top level functions from a potential DAIS application. GRA

IN-FLIGHT PERFORMANCE EVALUATION OF EXPERIMENTAL INFORMATION Final Report
Michael Lees, Michael G. Sanders, Raymond T. Burden, Jr., and Kent A. Kimball May 1979 27 p refs
(DA Proj. 3E7-62773-A-819)
(AD-A071701; USAARL-79-8) Avail: NTIS HC A03/MF A01 CSCL 01/4

The objective of this investigation was to evaluate a method of displaying information which permits rapid transmission of flight data to the operator under three viewing conditions: (1) day flights with the unaided eye, (2) night flights with the unaided eye, and (3) night flights using the AN/PVS-5 night vision goggles (40 deg field of view focused at infinity). Information obtained from the analyses of aviator performance data demonstrated the potential of presenting flight information to the aircrew via prototype displays for all viewing modes. GRA

F-4 RADAR ALTIMETER AURAL WARNING
29 Jun. 1979 4 p
(AD-A072870) Avail: NTIS HC A02/MF A01 CSCL 01/4

The F-4 radar altimeter has a red warning light that lights up when the aircraft goes below a selected altitude. This light is small and will not attract the pilot's attention if it is not in his field of view. Numerous accidents have occurred in which aircraft have struck the ground in level terrain when the mission required primarily straight and level flight. It has been postulated that an aural warning supplied by the radar altimeter would have alerted the aircrew in sufficient time to avoid contact with the ground. GRA

DEVELOPMENT OF STARTING POINTS FOR A SELECTIVE SUPPORT PROGRAM FOR CIVIL AVIONICS TECHNOLOGIES Final Report
Eberhard Hellermann and Herbert Weinreich Bonn Bundesmin. fuer Forsch. u. Technol. Jun. 1978 251 p refs In GERMAN; ENGLISH summary
(Contract BMFT-LFF-7605)
(BMFT-FB-W-78-21) Avail: NTIS HC A12/MF A01; Fachinformationszentrum Energie, Phys., Math., Eggenstein-Leopoldshafen, West Ger. DM 52,50

The technological and economic structure of the German civil avionics industry was analyzed. The study was mainly designed to answer the question of whether and in which area the technological development of the German civil avionics industry can be meaningfully furthered by systematic government support. The relevant information was obtained in interviews with experts in Germany and other countries. A Delphi survey and a workshop served to assess and check the plausibility of the results obtained. A catalog of 11 technologies recommended for public assistance under a support program of the Federal German Ministry of Research and Technology is given.

INFLUENCE OF COOLANT TUBE CURVATURE ON FILM COOLING EFFECTIVENESS AS DETECTED BY INFRARED IMAGERY
S. Stephen Papell, Robert W. Graham, and Richard P. Cageao Washington Nov. 1979 18 p refs
(NASA-TP-1546; E-066) Avail: NTIS HC A02/MF A01 CSCL 21E

Thermal film cooling footprints observed by infrared imagery from straight, curved, and looped coolant tube geometries are compared. It was hypothesized that the differences in secondary flow and in the turbulence structure of flow through these three tubes should influence the mixing properties between the coolant and the main stream. A flow visualization tunnel, an infrared camera and detector, and a Hilsch tube were employed to test the hypothesis. A.W.H.

OPPORTUNISTIC MAINTENANCE ENGINE SIMULATION MODEL: OMENS 2 Final Report
John L. Madden, Philip A. Persensky, Virginia L. Williamson, and Robert A. Novak Jun. 1979 133 p
(AD-A072516; AFLC/XRS-79-137-1) Avail: NTIS HC A08/MF A01 CSCL 21/5

This model simulates the operation of a single engine through a very long period of future time. In operating over this extended period, the engine must be removed for repair from time to time. Repairs become necessary on the engine when one of the modules fails prematurely or whenever it requires replacement of an internal life-limited part. The model tracks all the engine removals and all replacements of each module and offending life-limited part through future simulated time. Records are kept through simulated time of the number of removals and the reasons for removal for each module and for the engine. Reasons for removal include (1) premature failure of one or more parts, (2) reaching the scheduled operating time limit, or (3) being screened out due to the opportunistic maintenance policy. The model also computes maintenance, pipeline, parts costs, and transportation costs associated with the forecasted removals and aggregates the costs for any desired life cycle period (in years) to aid in selecting that optimal maintenance policy which produces the least total cost. SIMULATED MISSION ENDURANCE TEST (SMET) FOR AN AIRCRAFT ENGINE TO BE USED IN A FIGHTER/ATTACK ROLE Final Report
S. M. Cote and J. L. Birkler 23 Apr. 1979 130 p refs
(AD-A071907; NADC-77051-30) Avail: NTIS HC A07/MF A01 CSCL 21/5

A 750 hour simulated mission endurance test (SMET) cycle which will closely represent the expected in-service engine duty cycle for the F18 power plant has been developed. The test cycle evolved from an extensive investigation of Navy and Marine

fleet engine operating conditions experienced in fighter and attack aircraft during shorebased and carrier operations. The test cycles reflect power lever movements that are an order of magnitude greater than originally thought, and incorporate a representative distribution of time at intermediate and augmented power. It is concluded that this SMET will aid the overall development process to substantiate the suitability of a new engine for service introduction. GRA

Modifications in the procedure for hot spin testing ceramic rotors resulted in several changes. Of twenty-five rotors being proposed for hot testing, ten were inspected by dye-penetrant methods, dimensionally inspected, and curvic coupling contact patterns checked. Five have now completed hot testing, six are ready for test, and the remainder are in processing. Four ceramic turbine rotors and one rotor hub were qualified for hot testing in the cold spin pit at 55,000 rpm, and three rotors and two rotor hubs were qualified to 70,000 rpm. Blades were lost on all rotors qualified to 70,000 rpm because of gross flaws in the blade cross section. From four to eleven blades per rotor were lost in qualification testing. Six rotors was subjected to a twenty-five hour durability test in the hot spin test rig at 50,000 rpm and 1800 F rim temperature. Four rotors completed the test and two failed during acceleration to test speed. In several instances, post test rotor inspection revealed presence of curvic tooth cracking after disassembly from the test shaft. One of the successful rotors was operated an additional 175 hours to complete the objective of 200 hours at 1800 F rim temperature over a simulated duty cycle speed schedule. GRA

BLADED DISK DYNAMIC RESPONSE Final Report, 1 Sep. 1977 - 1 Sep. 1978
J. L. Bearden. Wright-Patterson AFB, Ohio. AFAPL. Feb. 1979. 41 p. refs.
(Contract F33615-77-C-2093; AF Proj. 2307)
(AD-A071975; PWA-FR-10576; AFAPL-TR-79-2002) Avail: NTIS HC A03/MF A01 CSCL 21/5

The feasibility of applying an optical derotator system to conduct dynamic structural analysis of a rotating/vibrating fully bladed gas turbine rotor assembly in a controlled spin pit facility was investigated. Interferometric holograms using pulsed laser holography were constructed for various assembly modes of vibration at assembly rotational velocities up to 835.6 rad/sec (8000 rpm). Results of this investigation are encouraging, although a large bias fringe density, resulting from a plexiglass panel in the optical train, made definitive analysis of the resultant mode shapes difficult. THE EFFECT OF INTERBLADE PHASE ANGLE AND SOLIDITY ON THE TIME VARIANT AERODYNAMIC RESPONSE OF A COMPRESSOR STATOR Interim Report, 1 May 1978 - 1 May 1979
R. R. Allran. Jun. 1979. 55 p.
(Contract F49620-78-C-0070; AF Proj. 2307)
(AD-A071878; DDA-EDR-9930; AFOSR-79-0853TR) Avail: NTIS HC A04/MF A01 CSCL 21/5

The overall objective of this experimental program was to quantify the effects of the reduced frequency as well as the interblade phase angle and associated solidity variations on the fundamental time variant aerodynamics relevant to forced response in turbomachinery. This was accomplished in a large, low speed, single-stage research compressor which permitted variation of the interblade phase angle and solidity by varying the number of rotor to stator blades. A single value of interblade phase angle, 36 degrees and a corresponding value of solidity of .758, the aerodynamically induced fluctuating surface pressure distributions on the downstream vane row, with the primary source of excitation being the upstream rotor wakes, were measured over a wide range of compressor operating conditions. The individual vane surface data were investigated to determine the effect of interblade phase angle and solidity on the overall unsteady pressure magnitude as well as to determine the dynamic pressure coefficient and aerodynamic phase lag for the unsteady pressure differential across the vanes. The unsteady pressure differential data were correlated with predictions from a state-of-the-art flat plate cascade transverse gust analysis. GRA

DESIGN AND PERFORMANCE EVALUATION OF SUPERCRITICAL AIRFOILS FOR AXIAL FLOW COMPRESSORS Final Report
H. E. Stephens and D. E. Hobbs. Jun. 1979. 45 p. refs.
(Contract N00019-77-C-0546)
(AD-A071206; PWA-FR-11455) Avail: NTIS HC A03/MF A01 CSCL 20/4

Pratt Whitney Aircraft has developed an analytical design procedure for producing supercritical cascade airfoils satisfying practical aerodynamic and structural requirements. The purpose of this research is to demonstrate the potential for substantial efficiency improvements in compressor stages incorporating these airfoil designs. The midspan section of a fan exit stator was selected for the design application. An airfoil was designed, fabricated, and tested in a transonic cascade tunnel. Test conditions were varied over a wide range of inlet flow angles and inlet Mach numbers to determine design and off-design performance. Test point information included inlet and exit conditions and airfoil surface pressure distribution. GRA

EVALUATION OF AN EJECTOR POWERED ENGINE SIMULATOR AT TRANSONIC MACH NUMBERS Final Report
C. E. Robinson. AEDC. Jul. 1979. 248 p. refs. Sponsored by the Air Force
(AD-A071607; AEDC-TR-78-69) Avail: NTIS HC A11/MF A01 CSCL 20/4

An experimental program was conducted to evaluate an air-driven ejector for use as a turbo-engine simulator in wind tunnel testing. The use of an engine simulator will provide the capability to simultaneously simulate inlet and afterbody flow fields of a turbo-powered vehicle. The ejector-powered engine simulator (EPES) was fitted to the right-wing nacelle of a 0.06 scale B-1 aircraft model. The B-1 model was chosen for the investigation because of the availability for comparisons of inlet and nozzle afterbody data previously obtained in the Arnold Engineering Development Center (AEDC) Propulsion Wind Tunnel Facility Propulsion Wind Tunnel (16T) using conventional test techniques. A limited amount of flight data from the B-1 flight to wind tunnel correlation program was also available to aid in determining the effectiveness of the EPES as a wind tunnel test tool. GRA

THE USE OF THE MAURER FACTOR FOR ESTIMATING THE COST OF A TURBINE ENGINE IN THE EARLY STAGES OF DEVELOPMENT Final Report, Jun. 1978 - Jun. 1979
Charles W. Barrett, Jr. and Michael J. Koenig. Jun. 1979. 165 p. refs.
(AD-A073018; AFIT-LSSR-19-79A) Avail: NTIS HC A08/MF A01 CSCL 14/1

Military managers are faced with increasing systems costs. One area where this increasing cost is especially true is in the acquisition of aircraft weapon systems. A driving factor in the aircraft cost is the turbine engine, and therefore, acquisition managers have been tasked with developing cost estimating methods that will more accurately predict turbine engine cost. At present, several parametric costing models available are briefly discussed in this report. However, the primary objective of this report, is to evaluate a costing technique used extensively by the Navy--the Maurer Factor (MF) technique. The MF technique is a parametric costing technique based on the materials in a turbine engine. The report includes the following: (a) a detailed

description of the MF technique; (b) a validation of the MF technique; (c) the development of an estimated MF (EMF) model using engine performance parameters; and (d) statistical analysis and validation of the EMF models. GRA

ON THE DEVELOPMENT OF THE RB 199
Mariano Gubitosi. London, Dec. 1978. 22 p. Transl. into ENGLISH from Rivista Aeron. (Rome), v. 54, no. 3, May-Jun. 1978 p. 32-39.
(DRIC-Trans-5429; BR67500) Avail: NTIS HC A02/MF A01.
The development of the RB 199 engine as a tailor-made solution for the MRCA 'Tornado' project is discussed. Operational requirements, such as very high thrust under combat flight conditions and low fuel consumption under other flight conditions, are considered. Design technological alternatives, principally thrust/weight ratio, and as built characteristics are examined. The triple-shaft configuration is treated in light of the performance principles of a jet engine. Among functional choices, afterburn, the double flow solution, and the setting of the by-pass ratio are particularly detailed. Finally, the RB 199 turbofan is described and a short synopsis of the design evolution of this engine is given. Author (ESA)

(Contract F33615-77-C-3013; AF Proj. 2307)
(AD-A072259; AFFDL-TR-78-123) Avail: NTIS HC A98/MF A01 CSCL 01/2.
This report is a study of the application of the entropy function of Information Theory to the analysis of sampled data systems so characteristic of the evolving and important field of digital flight control, including multimode systems. The systems studied are both feed-forward and feedback with the emphasis placed on the regulator problem. The feature common to all the configurations is the presence of a sensor which measures the input signal and which has an output that is usually some random function of the input. For the purposes of the analysis it is convenient to describe the behavior of the sensor by its Sensor Channel Transmittance, which is defined as the mutual information between the input and output of the measuring device. This quantity is not independent of the properties of the input signal, however, in any given problem it need only be calculated once. This research is important because it imbeds the control problem in the communication problem and clearly demonstrates the manner in which the information handling capability of the system elements limits performance, and is, therefore, of considerable potential significance to advanced flight dynamic systems. The goal of this research is to establish an orderly, relatively simple method for optimizing the presentation of motion cues in moving base simulations. This is accomplished via choice of the drive logic parameters for a given simulator and flying task. The method developed here is based upon use of motion fidelity criteria. It has been applied to optimize the LAMARS motion base drive logic parameters for an air-to-ground scenario. The methods and procedures can be applied for any given motion base and any desired scenario. This report describes the FORTRAN computer program used for evaluating and optimizing motion base drive logic. GRA

SYSTEMS ANALYSIS OF ARCTIC FUELS DISPENSING EQUIPMENT Final Report, 1 Jan. - 30 Jun. 1979
Donald B. Rosenfield, Edgar A. Gilbert, III, and John S. Howland 30 Jun. 1979 174 p
(Contract DAAK70-77-D-0024)
(AD-A071815; ADL-80260-18) Avail: NTIS HC A08/MF A01 CSCL 21/4

A systems analysis was performed to evaluate military fuel dispensing systems for arctic applications. The present systems, the Forward Area Refueling Equipment (FARE) and Fuels System Supply Point (FSSP), encounter problems in the areas because engines fail to start and elastomerics become brittle at temperatures of -60 F. The systems analysis consisted of two phases of evaluating and scoring system attributes for numerous combinations of systems concepts and components. The systems with the highest evaluations were the basic designs with gas turbine drives, state-of-the-art elastometrics, and either state-of-the-art batteries or a compressed gas start. It was also concluded that additonal development should be undertaken in the area of cold weather elastomerics. GRA

(VKI-TN-127) Avail: NTIS HC A04/MF A01

A method to measure adiabatic wall effectiveness and the associated heat transfer coefficient of a film cooling system under simulated gas turbine conditions in a short duration wind tunnel is described. This method is based on the measurement of heat transfer rates under different wall and coolant temperature conditions and the definition of a linear relationship between a heat transfer coefficient, h, based on the main stream recovery temperature, and a non dimensional temperature theta. The measurements on a film cooled flat plate at Mach 0.6, main stream temperature of 385 K, and unit Reynolds number of 2.4 million for a range of wall to main stream temperature ratios of from 0.70 to 0.93 and a range of coolant to mainstream temperature ratios between 0.73 and 0.93 with a coolant relative mass flow from 0.6 to 1.4 confirm the linearity of the h (theta) relation. This demonstrates that a short duration facility can provide good film cooling data with this method. Author (ESA)

DATA ACQUISITION SYSTEMS FOR THE HYPERSONIC GUN AND NITROGEN WIND TUNNELS
R. P. Bartlett, J. Davis, and J. K. Harvey Feb. 1979 32 p refs
(Contract AT/2037/084)
(IC-Aero-79-03) Avail: NTIS HC A03/MF A01

A digital system that links the Nitrogen Tunnel and the No. 2 Gun Tunnel to a time shared minicomputer system was

developed. The prime requirement for both facilities was data acquisition and processing, but in the case of the Nitrogen Tunnel it has also been possible to make on-line calculations and to present the processed data to the operator while the facility is running. A high speed digital data acquisition system was also commissioned to make detailed time resolved measurements in the Gun Tunnel which has a steady running time of a few milliseconds. Author (ESA)

SURVEILLANCE AND COMMUNICATION SYSTEMS USING MOBILE MEDIA ON THE AIRPORT SURFACE [SISTEMI DI SORVEGLIANZA E DI COMUNICAZIONE CON MEZZI MOBILI SULLA SUPERFICIE AEROPORTUALE]
Tullio Corzani (Trieste Univ., Italy) and Gabriele Falciasecca (Bologna Univ.) Sep. 1978 10 p refs In ITALIAN Presented at 79th A.E.I. Ann. Reunion, Catanzaro, Italy, Sep. 1978 Sponsored by CNR
(FUB-13-1978) Avail: NTIS HC A02/MF A01

The problems of an airport surface traffic control system developed in Italy are examined. A selection among possible systems is discussed, starting with solutions which use primary radar (now being adopted in many airports) and arriving at a completely automated system for surveillance and control of the airport surface, based on the use of secondary surveillance radar equipment on the ground. FEASIBILITY STUDY FOR SELECTED SPACELAB EXPERIMENTS CONDUCTED IN THE DISCIPLINES OF EARTH OBSERVATION AND METEOROLOGY Final Report
Hansgeorg Francois, Hans Werner Killian, Gerhard Bommas, Gerd Steffen, vonArved Breitenstein, Bernd Kunkel, and Peter Mueller Bonn Bundesmin. fuer Forsch. u. Technol. Dec. 1979 103 p refs In GERMAN; ENGLISH summary Prepared in cooperation with MBB, Munich
(Contracts BMFT-WRT-1075; DFVLR-BPT-01-QS-395)
(BMFT-FB-W-77-46) Avail: NTIS HC A06/MF A01; ZLDI, Munich DM 21.40

For five remote earth sensing and meteorological experiments proposed for the first SPACELAB mission the conceptual designs and feasibility of these payloads were studied. The results are used to support planning of hardware development. The five experiments selected require equipment such as a multi-channel scanning radiometer, a spectral albedometer, a trace gas analyzer, a multi-channel polarimeter, and a two-frequency microwave scatterometer. The feasibility analyses cover mission planning, system design, SPACELAB interfaces, and development planning. The results clearly show that even for the first SPACELAB mission it is feasible to develop and qualify these selected experiments. Author (ESA)

USE OF SPACELAB FOR THE SOLUTION OF TERRESTRIAL PLASMA RESEARCH PROBLEMS Final Report
Rainer Kist and Karl Rawer Bonn Bundesmin. fuer Forsch. u. Technol. Oct. 1978 65 p refs In GERMAN; ENGLISH summary
(Contracts BMFT-WRT-1076; DFVLR-BPT-01-QV-296)
(BMFT-FB-W-78-08) Avail: NTIS HC A04/MF A01; Fachinformationszentrum Energie, Phys., Math., Eggenstein-Leopoldshafen, West Ger. DM 13.45

A representative review of the problems in plasma physics is given. The main aims and problems of laboratory plasma physics are discussed in more detail. A few examples are chosen to demonstrate the potential of Spacelab plasma physics experiments to achieve these goals and help solve these problems. Candidates for plasma physical experiments on Spacelab include studies of excitation and propagation of electromagnetic and electrostatic waves in plasmas; processes and effects due to the interaction of a beam of charged particles with plasmas; processes and effects due to the interaction of strong electromagnetic wave fields with plasmas; production, properties, and consequences of instable plasma states; structure and dynamics of wakes behind bodies moving with respect to the plasma; and plasma diagnostic measuring methods. It is recommended that the use of the specific opportunities afforded by Spacelab for plasma research should be optimized by implementing activities of precursing and accompanying research with suitable laboratory plasma facilities. FEASIBILITY STUDY FOR THE SPACELAB USER PROGRAM. MEASUREMENT OF TERRESTRIAL NOISE, RADIO CONTROL Final Report
Reinhard Bredow, Anton Brunner, Dieter Lovis, Theodor Schwierz, Peter Kreutzer, and Rolf Stiefel Bonn Bundesmin. fuer Forsch. u. Technol. Nov. 1978 221 p refs In GERMAN; ENGLISH summary Prepared in cooperation with Std. Elec. Lorenz AG
(Contracts BMFT-WRT-1076; DFVLR-BPT-01-QV-616)
(BMFT-FB-W-78-14) Avail: NTIS HC A10/MF A10; Fachinformationszentrum Energie, Phys., Math., Eggenstein-Leopoldshafen, West Ger. DM 46.20

The feasibility of a 90 minute orbiter for scanning terrestrial natural noise (primary noise) and man made noise (secondary noise) was studied. The data are intended for use in compiling a noise map. Both are to be scanned by the 90 minute orbiter especially for the purpose of registrating a noise map. The frequency range to be scanned in the proposed experiment extends from 225 to 1000 MHz. The local scanning is handled by a wide angle antenna along with a narrow beam antenna with reflector size of 10 by 7 m and an area of resolution of about 18 to 70 km. The frequency scanning procedure is carried out by quickly switching extremely spectral pure synthesizers which control the quick amplitude amplification stages of the receiver belonging to the antenna concerned. The data processing system built around a microprocessor controls the sequence of the experiment as well as acquisition, processing, and storage of the picked up data. The incoming data rate will be 150 to 350 kbits depending on the chosen frequency resolution. Author (ESA)

PLANNING SYNTHESIS FOR SPACELAB PROJECTS IN COMMUNICATION AND NAVIGATION Final Report
Hans J. Albrecht Oct. 1978 89 p refs In GERMAN; ENGLISH summary
(Contracts BMFT-WRT-1076; DFVLR-BPT-01-QV-097)
(BMFT-FB-W-78-30) Avail: NTIS HC A05/MF A01; Fachinformationszentrum Energie, Phys., Math., Eggenstein-Leopoldshafen, West Ger. DM 18.50

Considering the present state of the art as well as current research work and developmental trends in communication and navigation, an analysis of Spacelab projects in this discipline is presented. An evaluation of experiment proposals submitted within the Federal Republic of Germany is given. As a synthesis of scientific planning activities, criteria of research relevancy, including trend analysis, application-oriented project results, and cost effectiveness are considered. Projects reviewed deal with electromagnetic wave propagation, modulation and bandwith, integrated communication systems, navigation systems, monitoring terrestrial parameters, and equipment technology in space. International coordination is reported and system oriented recommendations as well as a comprehensive bibliography are given. Author (ESA)

OPTIMUM SHAPE FOR TRANSPIRATION-COOLED NOSE-TIP OF A REENTRY VEHICLE Final Report, Oct. 1974 - Jun. 1978
Kevin E. Yelmgren Nov. 1978 93 p refs
(AF Proj. 2404)
(AD-A072296; AFFDL-TR-78-147) Avail: NTIS HC A05/MF A01 CSCL 16/3

The variations of parameters method was used to determine the optimum nose shape for a reentry vehicle having a transpiration-cooled nosetip (TCNT). Three families of nose shapes were considered - The oblate ellipsoid, the flat face - round shoulder, and the spherical arc - round shoulder. These families are bounded by the flat face - sharp corner at one extreme and the hemisphere at the other extreme. The amount of coolant required by each nose shape during reentry was determined by using a high speed computer to couple the aerodynamic equations with the trajectory equations. The optimum shape is the shape which requires the least amount of coolant for reentry. The flat face - sharp corner shape was found to require the least amount of coolant, about 60 percent less water than the hemisphere. Although the time to impact is longer for the flat face, the smaller surface area and lower heating intensity more than offsets the increased reentry time. The possibility of an optimum flat face height was also investigated; no face height was found that minimized the total heating to the vehicle during reentry. GRA

THE RSRE SATELLITE COMMUNICATIONS TEST FACILITY
E. H. Thomas Mar. 1978 15 p ref
(RSRE-78008; BR63099) Avail: NTIS HC A02/MF A01

An explanation of the functions of the facility and a list of in-orbit measurement accuracies are presented. The satellite communications test facility essentially consists of a number of satellite communications earth stations connected on-line into a central spacecraft test laboratory and from there into several research and development laboratories. The prime purpose of the facility is to support the development of satellite communications systems. The establishment is engaged in studies of satcoms for various defense purposes. Support to satellite communications projects includes the testing of new types of earth station equipments and sub-systems, and in-orbit testing of spacecraft. Such work includes studies of interference between various signals passing through spacecraft repeaters, diagnosis of fault conditions in the communications sub-systems of orbiting spacecraft, support of inter-operability trials, detailed measurement of transmissions from operational stations, measurement of spacecraft range, and other tasks requiring special expertise. APPLICATION OF IPAD TO MISSILE DESIGN
J. E. Santa and T. R. Whiting Apr. 1974 393 p refs Sponsored in part by Army Missile Command, Redstone Arsenal, Ala.
(Contract NAS1-12436)
(NASA-CR-132671) Avail: NTIS HC A17/MF A01 CSCL 16D

The application of an integrated program for aerospace-vehicle design (IPAD) to the design of a tactical missile is examined. The feasibility of modifying a proposed IPAD system for aircraft design work for use in missile design is evaluated. The tasks, cost, and schedule for the modification are presented. The basic engineering design process is described, explaining how missile design is achieved through iteration of six logical problem solving functions throughout the system studies, preliminary design, and detailed design phases of a new product. Existing computer codes used in various engineering disciplines are evaluated for their applicability to IPAD in missile design. A.W.H.

MODULAR DIGITAL MISSILE GUIDANCE Technical Report, 1 Jan. - 31 Oct. 1978
Frank J. Langley and John Demetrick 30 Nov. 1978 57 p refs
(Contract N00014-75-C-0549)
(AD-A072544; BR11013; ONR-CR233-052-5) Avail: NTIS HC A04/MF A01 CSCL 09/2

The rapidly developing microprocessor technology poses serious standardization problems for the user, particularly the military, where logistics support costs are significant over the life cycle of tactical systems. Whereas standard interface busses are now in existence e.g., (S-100, Intel Multibus, National Microbus, Motorola Microbus, European 'MUBUS'), no two busses are the same. To provide freedom of choice in microcomputer components throughout a system life cycle, a programmable microbus interface module (MIM) using common programmable control elements (PCEs), such as that described in this report, absorbs the interface irregularities of commercial microprocessors, memory and input-output (I/O) modules, thereby allowing the selection of components based on performance, support software, cost and other driving factors. DISTRIBUTED SOURCE GENERATION FOR RF ENVIRONMENTAL MODELING FOR HARDWARE-IN-THE-LOOP MISSILE GUIDANCE SIMULATION
F. M. Belrose and D. A. McPherson 12 Mar. 1979 19 p
(AD-A072927; DRDMI-T-79-37) Avail: NTIS HC A02/MF A01 CSCL 17/7

The basic simulation philosophy of the Advanced Simulation Center (ASC) is to incorporate as much missile hardware as possible into simulation. Errors associated with modeling nonlinear devices are thus avoided while increasing credibility of the simulation. However, this places a special burden on the simulators to display a realistic and comprehensive environment during the simulations because the seekers are stimulated at their operating wavelengths. The seeker is the more difficult subsystem to model properly, and if it is to form valid responses to environmental stimuli, then the stimuli must portray the correct time, space and frequency characteristics of the target, clutter, ECM and multipath. KINETIC HEATING OF HIGH SPEED MISSILES
B. E. Richards Jan. 1979 23 p refs Presented at AGARD Lecture Series on 'Missile Aerodyn.', Ankara, Rome, and Rhode Saint Genese, Belgium, Mar. 1979
(Preprint-1975-5) Avail: NTIS HC A02/MF A01

Kinetic heating as related to high speed tactical missiles is reviewed. The aspects considered are the design problem, the prediction of heating in attached and separated flows, measurements on configurations in flight and in wind tunnels, ground simulation obtained of flows over models, and the measurement of kinetic heating. Experience is generally obtained from studies in related areas such as high speed aircraft, reentry vehicles, etc., rather than on tactical missiles since little information appears to be available on this application. Because of the wide coverage of the field, a list of references is provided as a guide to papers giving more refined details. Author (ESA)

DESIGN AND OPERATION OF THE SEARCH-COIL MAGNETOMETER EXPERIMENT ON THE SOLAR PROBE HELIOS Final Report
Guenther Dehmel and Fritz Manfred Neubauer Bonn Bundesmin. fuer Forsch. u. Technol. Dec. 1977 76 p refs In GERMAN; ENGLISH summary
(Contracts BMFT-WRT-0107; GfW-01-H-3004)
(BMFT-FB-W-77-25) Avail: NTIS HC A05/MF A01; ZLDI, Munich DM 15.75

Scientific objectives, functioning, electronic and mechanical design, as well as operation of the HELIOS search-coil magnetometer experiment which investigates the magnetic component of electromagnetic waves in the solar wind from 0.3 to 1.0 AU are described. By means of its wave form channel (WFC) the rapid variations in the magnetic field are measured in 3 orthogonal directions from 4 to 128 Hz. The Spectrum Analyzer (SPA) observes power spectral density and peak values on the field components in the eliptic plane and perpendicular to it in the range from 4.7 to 2200 Hz. After amplification they are band-limited by low pass filters in the WFC and analog integrators

give output signals for digitization and transmission. The integrators in the second flight unit were replaced by amplifiers. The SPA data is automatically adapted to the telemetry capacity enabling a continuous transmission. Author (ESA)

The results are summarized of a program to demonstrate the feasibility of Bubble Domain Memory Technology as a mass memory medium for spacecraft applications. The design, fabrication and test of a partially populated 10 to the 8th power Bit Data Recorder using 100 Kbit serial bubble memory chips is described. Design tradeoffs, design approach and performance are discussed. This effort resulted in a 10 to the 8th power bit recorder with a volume of 858.6 cu in and a weight of 47.2 pounds. The recorder is plug reconfigurable, having the capability of operating as one, two or four independent serial channel recorders or as a single sixteen bit byte parallel input recorder. Data rates up to 1.2 Mb/s in a serial mode and 2.4 Mb/s in a parallel mode may be supported. Fabrication and test of the recorder demonstrated the basic feasibility of Bubble Domain Memory technology for such applications. Test results indicate the need for improvement in memory element operating temperature range and detector performance. R.C.L.

SPECIFIC SPACECRAFT EVALUATION: SPECIAL REPORT
Special Report, 1 Nov. 1977 - 1 Jun. 1978
J. M. Sellen, Jr. 1 Nov. 1978 211 p
(Contract NAS3-21047)
(NASA-CR-159420) Avail: NTIS HC A10/MF A01 CSCL 21H

Charged and neutral particle transport from an 8 cm mercury ion thruster to the surfaces of the P 80-1 spacecraft and to the Teal Ruby sensor and the ECOM-501 sensor of that spacecraft were investigated. Laboratory measurements and analyses were used to examine line-of-sight and nonline-of sight particle transport modes. The recirculation of Hg(+) ions in the magnetic field of the earth was analyzed for spacecraft velocity and Earth magnetic field vector configurations which are expected to occur in near Earth, circular, high inclination orbits. For these magnetic field and orbit conditions and for expected ion release distribution functions, in both angles and energies, the recirculation/reinterception of ions on spacecraft surfaces was evaluated. The refraction of weakly energetic ions in the electric fields of the thruster plasma plume and in the electric fields between this plasma plume and the material boundaries of the thruster, the thruster sputter shield, and the various spacecraft surfaces were examined. The neutral particle transport modes of interest were identified as sputtered metal atoms from the thruster beam shield. Results, conclusions, and future considerations are presented. R.C.T.

AN EXPERIMENTAL APPARATUS FOR INVESTIGATING THE KINETIC REACTIONS IN SOLID ROCKET NOZZLES
Final Report, 2 Jun. 1977 - 30 Mar. 1979
J. P. Pope and R. B. Dirling. Jun. 1979 62 p
(Contract F04611-77-C-0047)
(AD-A071318; AFRPL-TR-79-17) Avail: NTIS HC A04/MF A01 CSCL 21/8

The present interest in carbon composite and bulk polycrystalline graphite materials for solid propellant rocket nozzles has occurred, primarily due to the poor thermostructural performance of conventional pyrolytic graphite throat inserts as propellant flame temperature is increased. Circumvention of this problem has necessitated complex, multi-component nozzle configurations which are not only costly to fabricate, but inherently less reliable than an integral design. Composite materials, in particular carbon-carbon composites, offer the potential of considerable improvement in manufacturing, reliability and performance attributes compared to pyrolytic graphite. However, their ablation response in the primarily rate-controlled ablation regime of rocket nozzles is poorly understood. At the present time their ablation response is being assessed using the same techniques previously applied to non-porous pyrolytic graphite; e.g., evaluation of the kinetic coefficients from measurements of recession rate in arc plasma generator (APG) facilities. LGM-30B, STAGE 2 DISSECTED MOTORS Semiannual Test Report
Mar. 1979 144 p
(AD-A071402; MANCP-414(79)) Avail: NTIS HC A07/MF A01 CSCL 21/8

This report contains test data from propellant and case bond materials from Minuteman Stage 2 dissected motors. Testing was performed in accordance with Service Engineering General Test Directive GTD-1 Dissect dated 28 June 1974 and Project M83248C. Statistical analysis includes data from both inner (ANP 2864) and outer (ANP 2862) propellant. Test samples were obtained from two dissected motors this test period. Data obtained from these two motors have been combined with earlier test data from these same two motors and from a third motor. Linear regression plots using unique symbols to identify the three motors were used to indicate trends. Most of the propellant specimens were prepared and tested in the axial orientation, that is, parallel to the longitudinal axis of the motor. GRA

MEASUREMENTS OF TURBULENCE PARAMETERS IN A ROCKET ENGINE EXHAUST USING A LASER CROSSED BEAM CORRELATION TECHNIQUE
Gautam T. Kalghatgi. Jan. 1979 26 p refs
(AASU-340) Avail: NTIS HC A03/MF A01

The laser crossed beam correlation method in its Schlieren mode was used to measure the root mean square value of the fluctuation in density gradient along the flow direction, the integral scale in the transverse direction, convection velocity, and a form of time and length scales in the flow direction in the axisymmetric exhaust plume of a stationary liquid fuel rocket engine. Under certain restrictive assumptions, the root mean square value of the density fluctuation is also inferred. These measurements were made at different radial positions at four different axial stations

and are consistent with each other as well as with expectations based on previously published knowledge of axisymmetric turbulent jets. Author (ESA)

DEVELOPMENT AND FABRICATION OF BISMALEIMIDE-GRAPHITE COMPOSITES: Final Report
H. D. Stenzenberger, M. Herzog, W. Roemer, and R. Scheiblich. 23 Aug. 1979. 49 p.
(Contract NASw-3027)
(NASA-CR-152324; Rept.-7908) Avail: NTIS HC A03/MF A01 CSCL 11D

The successful fabrication of high temperature resistant composites depends mainly on the processability of the resin binder matrix. For two new bismaleimide type resins the processing of graphite fabric prepregs to composites is described. One resin coded M 751 has to be processed from N-Methylpyrrolidone, the other resin evaluated is a so-called hot melt solvent-less system. Commercial T300/3000 Graphite fabrics were used as reinforcement. The M 751 - Resin is a press grade material and laminates are therefore moulded in high pressure conditions (400 N/sq cm). The solvent-less resin system H 795 is an autoclave grade material and can be cured at 40 N/sq cm. The cure cycles for both the press grade and the autoclave grade material (Fiberite W 143 fabric prepregs) are provided and the mechanical properties of laminates at low (23 C) and high (232 C) temperatures were measured. For comparison, the neat resin flexural properties are also presented. The water absorption for the neat resins and the graphite fabric laminates after a 1000 hour period was evaluated. Author

CORROSION RESISTANT THERMAL BARRIER COATING: Patent Application
S. R. Levine, R. A. Miller, and P. E. Hodge, inventors (to NASA). Filed 31 Oct. 1979. 8 p.
(NASA-Case-LEW-13088-1; US-Patent-Appl-SN-089779) Avail: NTIS HC A02/MF A01 CSCL 11D

A thermal barrier coating system was developed to protect the surfaces of metal components, gas turbines, and other heat engine parts that are exposed to fuels contaminated with metallic impurities which are normally corrosive to previously known metallic coatings. The coating system includes a metal alloy bond coating, the alloy containing nickel, cobalt, iron, or a combination of these metals. The system also includes a corrosion resistant thermal barrier oxide coating containing at least one alkaline earth silicate. The preferred oxides are calcium silicate, barium silicate, magnesium silicate, or a combination of these silicates. NASA

MICROMECHANICS OF INTRAPLY HYBRID COMPOSITES: ELASTIC AND THERMAL PROPERTIES
C. C. Chamis and J. H. Sinclair. Washington, 1979. 19 p. refs. Presented at the Winter Ann. Meeting of the Am. Soc. of Mech. Engr., New York, 2-7 Dec. 1979.
(NASA-TM-79253; E-164) Avail: NTIS HC A02/MF A01 CSCL 11D

Composite micromechanics are used to derive equations for predicting the elastic and thermal properties of unidirectional intraply hybrid composites. The results predicted using these equations are compared with those predicted using approximate equations based on the rule of mixtures, linear laminate theory, finite element analysis and limited experimental data. The comparisons for three different intraply hybrids indicate that all four methods predict approximately the same elastic properties and are in good agreement with measured data. The micromechanics equations and linear laminate theory predict about the same values for thermal expansion coefficients. The micromechanics equations predict through-the-thickness properties which are in good agreement with the finite element results. Author

TENSILE AND FLEXURAL STRENGTH OF NON-GRAPHITIC SUPERHYBRID COMPOSITES: PREDICTIONS AND COMPARISONS
C. C. Chamis, J. H. Sinclair, and R. F. Lark. 1979. 27 p. refs. Presented at 11th Natl. Tech. Conf., Boston, Mass., 13-15 Nov. 1979; sponsored by Soc. for the Advancement of Material and Process Engr.
(NASA-TM-79276; E-203) Avail: NTIS HC A03/MF A01 CSCL 11D

Equations are presented and described which can be used to predict bounds on the tensile and flexural strengths of nongraphitic superhybrid (NGSH) composites. These equations are derived by taking into account the measured stress-strain behavior, the lamination residual stresses and the sequence of events leading to fracture. The required input for using these equations includes constituents, properties (elastic and strength), NGSH elastic properties, cure temperature, and ply stress influence coefficients. Results predicted by these equations are in reasonably good agreement with measured data for strength and for the apparent knees in the nonlinear stress-strain curve. The lower bound values are conservative compared to measured data. These equations are relatively simple and are suitable for use in the preliminary design and initial sizing of structural components made from NGSH composites. Author

DYNAMIC RESPONSE OF DAMAGED ANGLEPLIED FIBER COMPOSITES
C. C. Chamis, J. H. Sinclair, and R. F. Lark. 1979. 17 p. refs. Presented at the Winter Ann. Meeting of the Am. Soc. of Mech. Engr., New York, 2-7 Dec. 1979.
(NASA-TM-79281; E-182) Avail: NTIS HC A02/MF A01 CSCL 11D

The effects of low level damage induced by monotonic load, cyclic load and/or residual stresses on the vibration frequencies and damping factors of fiber composite anglepliied laminates were investigated. Two different composite systems were studied - low modulus fiber and ultra high modulus fiber composites. The results obtained show that the frequencies and damping factors of anglepliied laminates made from low modulus fiber composites are sensitive to low level damage while those made from ultra high modulus composites are not. Vibration tests may not be sufficiently sensitive to assess concentrated local damage in anglepliied laminates. Dynamic response determined from low-velocity impact coupled with the Fast Fourier Transform and packaged in a minicomputer can be a convenient procedure for assessing low-level damage. A.R.H.

DEVELOPMENT OF A REALISTIC STRESS ANALYSIS FOR FATIGUE ANALYSIS OF NOTCHED COMPOSITE LAMINATES
E. A. Humphreys and B. Walter Rosen. May 1979. 90 p. refs.
(Contract NAS1-15411)
(NASA-CR-159119; MSC-TFR-1005/0206) Avail: NTIS HC A05/MF A01 CSCL 11D

A finite element stress analysis which consists of a membrane and interlaminar shear spring analysis was developed. This approach was utilized in order to model physically realistic failure mechanisms while maintaining a high degree of computational economy. The accuracy of the stress analysis predictions is

verified through comparisons with other solutions to the composite laminate edge effect problem. The stress analysis model was incorporated into an existing fatigue analysis methodology and the entire procedure computerized. A fatigue analysis is performed upon a square laminated composite plate with a circular central hole. A complete description and users guide for the computer code FLAC (Fatigue of Laminated Composites) is included as an appendix. A.R.H.

CLASSICAL ANALYSES OF LAMINATED BIMODULUS COMPOSITE MATERIAL PLATES
Charles W. Bert. Jul. 1979. 42 p. refs.
(Contract N00014-78-C-0647)
(AD-A072276; OU-AMNE-79-10) Avail: NTIS
HC A03/MF A01 CSCL 20/11

A differential-equation formulation is presented for the equations governing the small-deflection elastic behavior of thin plates laminated of anisotropic bimodulus materials (which have different elastic stiffnesses depending upon the sign of the fiber-direction strains). As a basis for comparative evaluation of a finite-element formulation presented in Technical Report No. 3 of the contract, exact closed-form solutions are presented for two cross-ply-laminated plate problems: (1) a freely supported rectangular plate subjected to a sinusoidally distributed normal pressure, and (2) a fully clamped elliptic plate subjected to uniform normal pressure. For the special case of isotropic bimodulus material, simplified approximate solutions are deduced from the exact ones. Good agreement is obtained among the two solutions presented here, as well as with numerical results existing in the literature for special cases and with the finite-element results. Also, for the first time, a closed-form solution is presented for a rectangular plate arbitrarily laminated of anisotropic ordinary (not bimodulus) material. GRA

ENGINEERING DESIGN HANDBOOK. JOINING OF ADVANCED COMPOSITES
Andrew Devine. Mar. 1979. 147 p. refs.
(AD-A072362; DARCOM-P-706-316) Avail: NTIS
HC A07/MF A01 CSCL 13/8

This handbook should serve as a guide to designers concerned with the technology associated with the joining of advanced composites. It deals with basic joint design practice as well as with those practices specific to composite joining. Tabulated and graphical representations of joint property data obtained on both bonded and mechanically fastened composites are presented. These data can be used by designers to test the degree of conservatism in calculated joint properties for their composite joint designs and hopefully will impart the necessary degree of confidence or warriness in the early design stages where alterations can be made most economically. It is hoped that the diversity of joint possibilities and the magnitude of the joint strength properties reported will prompt cautious designers of Army materiel to make use of the strength-to-weight advantages offered by advanced composites and also to recognize that the technology is available for practical implementation of these valuable engineering materials. TRANSIENT HYDROTHERMAL STRESSES IN COMPOSITES: COUPLING OF MOISTURE AND HEAT WITH TEMPERATURE VARYING DIFFUSIVITY Final Report
G. C. Sih and M. T. Shih. Mar. 1979. 67 p. refs.
(Contract DAAG46-78-C-0014; DA Proj. 8X3-63304-D-215)
(AD-A072613; AMMRC-TR-79-14) Avail: NTIS
HC A04/MF A01 CSCL 11/4

The influence of coupled diffusion of heat and moisture on the transient stresses in a composite is investigated analytically, where the moisture diffusion coefficient is taken to be temperature dependent, while the thermal diffusion coefficient is kept constant. A study of the coupled diffusion equations were made by a finite-difference scheme allowing for time-dependent changes in the humidity and temperature of the environment. The appropriate transient boundary conditions are specified on the surfaces of an infinite plate. Numerical calculations were carried out for the T300/5208 graphite fiber-reinforced epoxy matrix composite, in which the nonuniformity of moisture and temperature is evaluated for sudden changes in the surface moisture and/or temperature. The coupling effect between temperature and moisture is found to be most significant when the plate undergoes a sudden change in surface temperature while the surface moisture concentration is held constant. The present findings indicate that the stresses due to coupling can deviate from the uncoupled results anywhere from 20 to 80 percent depending on the surface temperature gradient. GRA

COATING LAMINATED SUBSTRATES Final Report
G. J. Hale. Jan. 1979. 18 p. refs. Revised.
(Contract EY-76-C-04-0613)
(BDX-613-2062-Rev) Avail: NTIS HC A02/MF A01

The feasibility and development results for coating uniform 6.3 to 12.7 micron m metal films on flat and non-planar Mylar or Kapton laminated substrates are summarized. Four coating techniques (ion plating of aluminum, chemical vapor deposition of aluminum, electroless plating of copper and nickel, and physical vapor deposition of aluminum and aluminum-0.12 weight percent copper) were evaluated. Based on the capability of each process and the resulting properties and structure of these coatings with respect to the requirements, physical vapor deposition was

selected for further development. Processes were developed for depositing aluminum-0.12 weight percent copper alloy from an rf induction vapor source and for depositing pure aluminum from an electron beam gun vapor source. In addition, precision pattern deposition of aluminum from an electron beam gun vapor source was demonstrated for flat Kapton substrates. DOE

HYGROTHERMAL EFFECTS ON THE MECHANICAL RESPONSE OF KELVAR 49/EPOXY LAMINATES
R. E. Allred 1978 16 p refs Presented at DOE Compatibility Meeting, Golden, Colo., 17 Oct. 1978
(Contract EY-76-C-04-0789)
(SAND-78-1362C; Conf-781067) Avail: NTIS HC A02/MF A01

Prior to use in weapon systems, it is necessary to understand the durability of materials in a long term storage environment. The effects of moisture and temperature on the flexural response of Kevlar reinforced epoxy laminates are examined. Temperature or moisture alone do not severely affect the mechanical properties of Kevlar/epoxy; however, strength losses up to 60 percent and modulus losses of 45 percent are seen with saturation moisture contents (5 weight percent) tested at 150 C. Results indicate that filament hygrothermal degradation is the dominant mechanism until moisture solvation depresses the matrix Tg below the test temperature. This is in direct contrast to the majority of high performance resin-matrix composites which exhibit little filament degradation. It is recommended that Kevlar/epoxy components be coated with moisture barriers and that research be conducted on prospective coatings. DOE

INFLUENCE OF ENVIRONMENTAL CYCLING ON THE MECHANICAL PROPERTIES OF COMPOSITE MATERIALS, PART 2
Christer L. Lundemo 1978 56 p refs
(Contract FMV-F-FL-82223-75083-07-001)
(FFA-TN-HU-1853:1-Pt-2) Avail: NTIS HC A04/MF A01

Static and fatigue tests (R = 0.1 and R = -1) on carbon fiber reinforced test specimens exposed to temperature and moisture cycling were carried out with the purpose of simulating the real environmental conditions an aircraft may meet during actual use. The investigation comprised regular test specimens and beams built up from carbon fiber prepreg THORNELL 300/NARMCO 5208. The results show that the mechanical properties of the laminate were not influenced by the relatively moderate environmental cycling used. Better fatigue properties were measured for specimens exposed to humid conditions, compared with untreated specimens. This effect is valid only for short times of exposure. Author (ESA)

This report describes the development of a modular model for the prediction of the performance of sudden expansion burners as a function of the controllable parameters relevant to combustor design. The model is based upon a concept in which the recirculation zone, treated as a stirred reactor, is coupled to a parabolic boundary layer formulation for the flow outside the recirculation zone. Hydrocarbon oxidation kinetics and turbulent kinetic energy models are employed in the model development. In addition to the parabolic-flow and stirred reactor elements, a module representing the fuel injection process has been developed. Results of the application of the modular model to the analysis of cold-flow and reacting-flow dump combustor experimental data are described. GRA

The unsteady one-dimensional interaction of a planar flame, propagating through a fuel-lean premixture, with a parallel impervious noncatalytic wall is modeled as a Stefan-type problem incorporating one-step chemistry. Quantitative details concerning retardation of flame speed near an isothermal wall (pertinent to current cooled engines), and concerning acceleration of flame speed near an adiabatic wall (pertinent to proposed engines), are obtained. The time history of unburned hydrocarbon content varies with dimensionless Arrhenius activation energy, the order of the reaction chemistry, and the Lewis-Semenov number. Both

temporally varying pressure, and also nonuniform fuel stratification, are discussed. GRA

(AD-A073001; Contrib-6006; TR-9) Avail: NTIS HC A02/MF A01 CSCL 07/4

Depending on the initial energies, a proton transfer may proceed either via a saddle-point in a potential energy surface or by crossing from the reactants' to the products' valley before the saddle-point is reached. In the second path the analogy to weak-overlap electron transfers is pointed out. The present study is intended to unify previously divergent viewpoints, by showing how they are special cases of a more general picture. Expressions are obtained for the reaction rate in terms of the properties of the potential energy surface and of other properties of the system, using a hydrogen overvoltage reaction as an example. A generalized time-temperature-transformation diagram for the thermosetting process is presented in which the four physical states encountered (i.e., liquid, rubber, ungelled glass and gelled glass) are related to the time and temperature of cure. Gelation and vitrification, as a consequence of quenching morphological development and chemical conversion respectively, are discussed with respect to control of material properties. GRA

NUMERICAL DECONVOLUTION OF PHOTOELECTRON SPECTRA OF LIQUIDS
James B. Flanagan Jul. 1979 25 p refs
(Contract N00014-75-C-0397)
(AD-A073087) Avail: NTIS HC A02/MF A01 CSCL 07/4

Described is a method for the deconvolution or removal of spectral broadening due to electron interactions with solvent in liquid-phase ultraviolet photoelectron spectroscopy. Certain differences between this usage of deconvolution and its usual applications in pes are noted. Application of the technique is illustrated using synthetic and experimental data. Possible uses include recovering the 'original' photoemission spectrum before broadening by liquid as well as studying the mechanism of energy loss in solvent. Effects of unscattered electrons on the interpretation of this procedure are discussed. GRA

X-RAY EXCITED OPTICAL LUMINESCENCE OF POLYNUCLEAR AROMATIC HYDROCARBONS Ph.D. Thesis
Gregory Joseph Oestreich May 1979 164 p refs
(Contract W-7405-eng-82)
(IS-T-856) Avail: NTIS HC A08/MF A01

X-ray excited optical luminescence (XEOL) coupled with time resolved spectroscopy was employed to analyze polynuclear aromatic hydrocarbons (PAH) in n-alkane solvents at 10 K. A pulsed XEOL system which was designed around minicomputer control of a medical X-ray unit was developed. Computer software which generated variable width X-ray pulses, monitored timing reference pulses, controlled data acquisition, and analyzed data was written. Phosphorescence decay constants of several PAHs were determined. Synthetic mixtures of zone refined PAHs were prepared and time resolved with the pulsed XEOL technique. Analytical results obtained from the five component mixtures of PAHs at the part per million level were tabulated. Systematic improvements and further development of the pulsed XEOL method were considered. DOE

ANALYSIS OF BACKMIXING AND MASS TRANSFER IN SOLVENT EXTRACTION COLUMNS M.S. Thesis
Mahmoud Nazem Jan. 1979 155 p refs
(Contract W-7405-eng-82)
(IS-T-851) Avail: NTIS HC A08/MF A01

The true mass transfer coefficients in backmixed solvent extraction columns are presented. These parameters are of great significance and are very useful in the design and performance evaluation of solvent extraction columns. Several approximate correlations of these parameters as a function of column geometry, operating conditions, and physical properties of the liquid systems involved were developed, and it is possible to use mathematical models in the interpretation and analysis of experimenttal data to determine which correlations appear to be most accurate and easiest to use. The results of the data analysis, together with the best possible estimate of the extraction efficiency were applied to a differential backmixing model to obtain concentration profiles in an extraction column. DOE

CHROMATOGRAPHY OF METAL IONS WITH A TRIAZINE CHELATING RESIN M.S. Thesis
Wang-Nang Wang May 1979 65 p refs
(Contract W-7405-eng-82)
(IS-T-855) Avail: NTIS HC A04/MF A01

The synthesis, characterization, and some analytical applications of a new triazine resin are described. Separation of group 1B, 2B, 6B, and 7B metal ions from group 8 metal ions is achieved by this PDT-4 resin. Calcium(II) and magnesium(II) are taken up at pH = 6,0.1 M acetate and are eluted at pH = 6,0.1 M sodium nitrate. Copper(II) is retained at pH = 6,0.1 M acetate and pH = 1 hydrochloric acid and is eluted subsequently by 5 M perchloric acid. Molybdenum(VI) is sorbed selectively from 0.1 N sulfuric acid or hydrochloric acid and is eluted in a tight band by 0.1 N sodium hydroxide. Numerous rapid column chromatographic separations are reported using this new resin, including analysis of NBS standard samples. DOE

CHEMICAL STRUCTURES AND REACTIVITIES OF COAL AS AN ORGANIC NATURAL PRODUCT
Clair J. Collins, H. P. Hombach, B. M. Benjamin, W. H. Roark, B. Maxwell, and V. F. Raaen 1979 6 p refs Presented at 177th ACS Natl. Meeting, Honolulu, Hawaii, 1 Apr. 1979
(Contract W-7405-eng-26)
(CONF-790415-25) Avail: NTIS HC A02/MF A01

Some chemical reactions involved in coal liquefaction were studied using carbon 14 labelled compounds and nuclear magnetic resonance. It is concluded that the role of tetralin during coal conversion is (1) to act as a dispersion vehicle; (2) to supply hydrogen radicals, when needed, to trap coal radicals; and (3) in a very minor way to undergo intermolecular reaction with the coal through making and breaking of C-C (and possibly other) bonds. As a result of other experiments it is concluded that to the methods previously employed for breaking bonds in coal molecules and thereby lowering their molecular weights, must now be added the use of solvated-electrons for break-

ing -CH2-CH2-linkages. A possible mechanism for the cleavage of bibenzyl (used as a model compound for coal) is given. DOE

CALCULATION OF CHEMICAL EQUILIBRIUM BETWEEN AQUEOUS SOLUTION AND MINERALS: THE EQ3/6 SOFTWARE PACKAGE
T. J. Wolery. 1 Feb. 1979. 46 p. refs.
(Contract W-7405-eng-48)
(UCRL-52658) Avail: NTIS. HC A03/MF A01

The newly developed EQ3/6 software package computes equilibrium models of aqueous geochemical systems. The package contains two principal programs: EQ3 performs distribution-of-species calculations for natural water compositions; EQ6 uses the results of EQ3 to predict the consequences of heating and cooling aqueous solutions and of irreversible reaction in rock-water systems. The programs are valuable for studying such phenomena as the formation of ore bodies, scaling and plugging in geothermal development, and the long-term disposal of nuclear waste. EQ3 and EQ6 are compared with such well-known geochemical codes as SOLMNEQ, WATEQ, REDEQL, MINEQL, and PATHI. The data base allows calculations in the temperature interval 0 to 350 C, at either 1 atm-steam saturation pressures or a constant 500 bars. The activity coefficient approximations for aqueous solutes limit modeling to solutions of ionic strength less than about one molal. The mathematical derivations and numerical techniques used in EQ6 are presented in detail. DOE

LOCAL TURBULENCE PROPERTIES IN FLAMES FROM TIME-AVERAGED RAMAN SPECTROSCOPY MEASUREMENTS
R. E. Setchell. 1979. 10 p. refs. Presented at the AIAA Aerospace Sciences Meeting, New Orleans, 15 Jan. 1979.
(Contract EY-76-C-04-0789)
(SAND-78-1263C; Conf-790102-1) Avail: NTIS. HC A02/MF A01

Local fluctuations in temperature and composition in a turbulent flame are examined through their influence on Raman-scattering measurements of time-averaged flame properties. Using mean temperatures and number densities measured in a hydrogen diffusion flame, two approaches to investigating turbulence properties are examined. In the first, which is restricted to flame condition where fluctuations are fairly small, the variation of measured number density with spectral resolution is used to determine values for particular correlations between fluctuations in number density and temperature. In the second approach the Raman measurements are used to evaluate a particular model for concentration fluctuations. DOE

PARTIAL MOLAR VOLUMES OF HYDROGEN AND DEUTERIUM IN NIOBIUM AND VANADIUM. M.S. Thesis
H. M. Herro. Jan. 1979. 42 p. refs.
(Contract W-7405-eng-82)
(IS-T-839) Avail: NTIS. HC A03/MF A01

Lattice dilation studies and direct pressure experiments gave comparable values for the partial molar volumes of hydrogen and deuterium in niobium and vanadium. Small isotope effects in the partial molar volume of hydrogen were measured in both metals by the differential isotope method. Hydrogen had a larger partial molar volume than deuterium in niobium, but the reverse was true in vanadium. The isotope effect measured in niobium can be represented as being due to the larger amplitude of vibration of the hydrogen atom than the deuterium atom in the metal lattice. Since hydrogen has a larger mean displacement from the equilibrium position than does deuterium, the average force hydrogen exerts on the metal atoms is greater than the force deuterium exerts. The isotope effect in vanadium is likely a result of anharmonic effects in the lattice and local vibrational modes. DOE

CHEMICAL VAPOR DEPOSITION OF TiB2 ON GRAPHITE
H. O. Pierson and E. Randich. 1978. 15 p. refs. Presented at 6th Conf. on Borons and Borides, Drubzna, Bulgaria, 9 Oct. 1978.
(Contract EY-76-C-04-0789)
(SAND-78-1794C; Conf-781064-1) Avail: NTIS. HC A02/MF A01

An experimental investigation of the coating of graphite with TiB2 by chemical vapor deposition (CVD) using the hydrogen reduction of BCl3 and TiCl4 at 925 C and 1 atm. Reasonable matching of the thermal expansion of TiB2 and graphite was necessary to eliminate cracking. A suitable graphite was POCO DFP-1. Adhesion was improved by having a slightly rough graphite surface. Heat treatment at 2000 C and above resulted in a certain degree of diffusion. No melting or solid phases other than TiB2 and graphite were detected up to 2400 C. The coatings showed no failure when repeatedly submitted to an electron beam pulse of 2 KW/sq cm for 0.9 sec. DOE

RESONANCE RAMAN SPECTRA OF METAL HALIDE VAPOR COMPLEXES
G. N. Papatheodorou. 1978. 63 p. refs. Presented at 10th Mater. Res. Symp., Gaithersburg, Md., 18 Sep. 1978.
(Contract W-31-109-eng-38)
(CONF-780941-8) Avail: NTIS. HC A04/MF A01

Resonance Raman spectra of complex vapor phase compounds formed by reacting acidic gases (A2X6 = Al2Cl6, Al2Br6, In2Cl6) with metal halides have been measured. Spectra obtained from equilibrium vapor mixtures of A2X6 over solid MX2 (= PdCl2, PdBr2, CuCl2, CoBr2, TlCl2, FeCl2, NiCl2, PtCl2) were a superposition of the A2X6-AX3 bands and in few cases of new resonanceenhanced polarized bands due to MA2X8 and/or MAX5 complexes. At temperatures above 800 deg K, characteristic bands due to MX2(g) (M = Fe, Co, Ni, Cu, Zn) and M2X4(g) (M = Cu) were observed. The predominant features of the PdAl2Cl8, CuAl2Cl8, and PdAl2Br6 spectra were three high-intensity, polarized bands which were attributed to the vibrational modes of the complex coupled to the electronic state of the central atom. The spectra of CuAlCl5(g), CuInCl5(g) and Cu2Cl4(g) species showed resonance enhancement of selective fundamentals which were attributed to vibrational modes of trigonally coordinated Cu(II). DOE

RHEOLOGY OF CONCENTRATED SUSPENSIONS
M. vandenTempel. 1978. 10 p. refs. Revised. Submitted for publication.
Avail: NTIS. HC A02/MF A01

The viscoelastic properties of a flocculated dispersion, at small or slow deformations, are explained in terms of a network model. If the network consists of single particle chains the modulus and strength are proportional to the first power of the volume fraction and weakly dependent on the particle size. More realistic results are now obtained by constructing a network in which the chains consist of preformed aggregates. In several systems, the state of aggregation is found to depend on volume fraction and particle size only through the total particle concentration. Author (ESA)

COMBUSTION OF LOW GRADE COAL
G. F. Morrison. Jun. 1978. 90 p. refs.
(ICTIS/TR-02; ISBN-92-9029-016-1) Avail: NTIS
HC A05/MF A01

A technical review of the literature is presented in order to assess the increasing extent to which lignite, brown coal, peat, and bituminous shale are combusted for power generation. Although the most common form of combustion in use today, the firing of pulverized low grade coal has presented major operational problems of erosion, corrosion, and fouling of heat exchange equipment. Recent developments in the design of pulverized-coal fired stations are discussed. Fluidized bed combustion has the potential to overcome many of these problems and a brief history of the development of this form of combustion and an assessment of current research is included. One important parameter in the future development of low grade coal combustion is the ability of power stations to comply with national emission standards. The influence of combustion mode on the emission of SO2, NO, and particulates is reviewed. Author (ESA)

N80-11180# IEA Coal Research, London (England).
TRACE ELEMENTS FROM COAL COMBUSTION: ATMOSPHERIC EMISSIONS
M. Y. Lim. May 1979. 58 p. refs.
(ICTIS/TR-05; ISBN-92-9029-024-2) Avail: NTIS
HC A04/MF A01

The literature relating to trace elements in coal combustion is reviewed from the point of view of atmospheric pollution. Some data on trace element concentration in coal are given and comparisons are made with atmospheric emissions from other sources. Environmental effects and potential health hazards are discussed. Radioactive emissions and trace element accumulation around power plants are also reviewed and types of equipment used for particulate control in power plants are summarized. It is concluded that the importance of coal combustion as a pollutant source depends on what type of regulations are established for emission control and on how well power plants comply with these regulations. OXIDATION OF GALLIUM ARSENIDE IN A PLASMA MULTIPLE DEVICE. STUDY OF THE MOS STRUCTURES OBTAINED Final Report [OXYDATION DE L'ARSENIURE DE GALLIUM PAR PLASMA EN UTILISANT UN DISPOSITIF MULTIPOLAIRE. ETUDE DES STRUCTURES MOS OBTENUES]
Serge Gourrier, Andrei Mircea, and Francois Simondet. Dec. 1978. 61 p. refs. Partly in FRENCH and ENGLISH.
(Contract DGRST-77-7-1638)
(LEP-79/62.SME-687-A) Avail: NTIS. HC A04/MF A01

The oxygen plasma oxidation of GaAs was studied in order to obtain extremely high frequency responses with MOS devices. In the multipole system (magnetic confinement associated with a hot cathode), a homogeneous oxygen plasma of high density 5 x 10 to the 10 power/cu cm) can easily be obtained in a large volume. This system is thus highly convenient for the study of plasma oxidation of GaAs. The electrical properties of the MOS diodes obtained in this way are controlled by interface states, located mostly in the upper half of the band gap where densities in the 10 to the 13 power/sq cm x eV range can be estimated. Despite these interface states the possibility of fabricating MOSFET transistors working mostly in the depletion mode for a higher frequency cut-off still exists. Author (ESA)

SURFACE REACTIONS OF OXIDES OF SULFUR
J. H. Lunsford. Apr. 1979. 42 p. refs.
(Grant EPA-R-801136)
(PB-297410/3; EPA-600/7-79-088) Avail: NTIS
HC A03/MF A01. CSCL 07D

Surface reactions of several sulfur-containing molecules were studied in order to understand the mechanism by which sulfate ions are formed on atmospheric aerosols. At 25 C the heterogeneous oxidation of SO2 by NO2 to sulfuric acid and sulfate ions occurred on hydrated silica and silica-alumina surfaces. The oxidation of SO2 by O2 was undetectably slow on these surfaces, however, the reaction was catalyzed by Mn(+2) ions in a Y-type zeolite in this case the only reaction product was a SO4(-2) species which was strongly bound in the zeolite micropores. Molecule oxygen also reacted with H2S on zeolites and magnesium oxide. The mechanism by which S2O(-) and H2S2(-) are formed on MgO was determined. GRA

MECHANICAL PROPERTIES AND OXIDATION AND CORROSION RESISTANCE OF REDUCED-CHROMIUM 304 STAINLESS STEEL ALLOYS
Joseph R. Stephens, Charles A. Barrett, and Charles A. Gyorgak. Washington, Nov. 1979. 22 p. refs.
(NASA-TP-1557; E-065) Avail: NTIS HC A02/MF A01 CSCL 11F

An experimental program was undertaken to identify effective substitutes for part of the Cr in 304 stainless steel as a method of conserving the strategic element Cr. Although special emphasis was placed on tensile properties, oxidation and corrosion resistance were also examined. Results indicate that over the temperature range of -196 C to 540 C the yield stress of experimental austenitic alloys with only 12 percent Cr compare favorably with the 18 percent Cr in 304 stainless steel. Oxidation resistance and in most cases corrosion resistance for the experimental alloys were comparable to the commercial alloy. Effective substitutes for Cr included Al, Mo, Si, Ti, and V, while Ni and Mn contents were increased to maintain an austenitic structure. R.C.T.

EFFECT OF THERMALLY INDUCED POROSITY ON AN AS-HIP POWDER METALLURGY SUPERALLOY
R. L. Dreshfield and R. V. Miner, Jr. Washington, 1979. 20 p. refs. To be presented at Ann. Meeting of the Am. Inst. of Mining, Met. and Petol. Engr., Las Vegas, Nev., 24-28 Feb. 1980.
(NASA-TM-79263; E-178) Avail: NTIS HC A02/MF A01 CSCL 11F

The impact of thermally induced porosity on the mechanical properties of an as-hot-isostatically-pressed and heat treated pressing made from low carbon Astroloy was determined. Porosity in the disk-shape pressing studied ranged from 2.6 percent at the bore to 1.4 percent at the rim. Tensile, yield strength, ductility, and rupture life of the rim of the porous pressing was only slightly inferior to the rim of sound pressings. The strength, ductility, and rupture life of the bore of the porous pressing was severely degraded compared to sound pressings. At strain ranges typical of commercial jet engine designs, the rim of the porous pressing had slightly inferior fatigue life to sound pressings. A.R.H.

IMPACT INDUCED TENSILE FAILURES IN STEEL
Stephan J. Bless and John P. Barber. Feb. 1979. 55 p. refs. (Contract F33615-76-C-5124; AF Proj. 2307)
(AD-A072477; UDR-TR-78-56; AFML-TR-79-4020) Avail: NTIS HC A04/MF A01 CSCL 11/6

Steel spheres 11 mm in diameter struck hemispherical and cylindrical targets at 3 km/s. Materials were AISI 1020 and 4340. Tensile strength of these materials at strain rates of .0001/s to 1000/s was determined and important rate effects were observed. Peak particle velocity as a function of range and angle was measured by a fly-off plate technique. Peak stress was calculated from these data. Failure modes were determined from post-impact analysis of targets. Targets less than 6 cm diameter were totally fragmented. The 8 cm diameter hemispheres failed in bi-axial tension. The 4 cm thick hemispheres failed by planar spall. Large targets did not undergo gross tensile failure. GRA

STRAIN RATE EFFECTS ON ULTIMATE STRAIN OF COPPER Technical Report, Oct. 1976 - Oct. 1977
David P. Bauer and S. J. Bless. May 1979. 85 p. refs. (Contract F33615-76-C-5124; AF Proj. 2307)
(AD-A072175; UDR-TR-78-45; AFML-TR-79-4021) Avail: NTIS HC A05/MF A01 CSCL 11/6

The strain-rate effect on strain to failure of copper was experimentally investigated. Both Oxygen Free High Conductivity (OFHC) copper and Electrolytic Tough Pitch (ETP) copper were studied. Ultimate strains were measured for a range of strain rates from 0.0001 strain/second to over 10000.0 strain/second.

Normal quasi-static tensile machines were used at low strain rates, a split Hopkinson bar apparatus was used at strain rates of 1000.0 strain/second, and an exploding tube technique was developed for strain rates to over 10000.0 strain/second. High speed photographic techniques and post shot fragment analysis were used to determine the strain rate effects. Copper shows little strain rate dependence below 1000.0 strain/second with average ultimate strains around 0.4. Above approximately 5000.0 strain/second, several geometrical and material related factors cause the average ultimate strain to increase to values above 1.3, due to suppression of necking in the material until very late in the straining process. OFHC copper and ETP copper behave much the same to strain rates of 10000.0 strain/second. GRA

HC A02/MF A01 CSCL 11/6

Attempts to control the dynamic compression failure modes of tungsten fiber reinforced steel matrices included changing the matrix material from mild steel to a hypereutectoid steel. However, the thermo-mechanical processes used to fabricate such metal matrix composite materials produce mixed microstructures, and it was not known to what extent the nonmartensitic transformation products influence mechanical behavior. This work examines the effects of isothermally transformed pearlite, bainite, and cementite on the strength, ductility, and plane-strain fracture toughness of a hypereutectoid silico-manganese steel that typifies the compositions being evaluated for a class of metal matrix composite systems. The small-grained, quenched-and-tempered martensite was the toughest material (60 MPa sq. root of m). Increasing the pearlite content gradually decreased the fracture toughness. However, increasing the banite content by even slight amounts produced a catastrophic decrease in fracture toughness to half that value, which was found to be nearly the minimum KIC determined from low temperature (-54C) tests, i.e., 28 MPA sq. root of m. This result dramatizes the importance of careful heat treatment when using such materials in engineering structures. GRA

HOT CORROSION DEGRADATION OF METALS AND ALLOY: A UNIFIED THEORY. Final Scientific Report, 1 Jun. 1976 - 30 Sep. 1978
C. S. Giggins and F. S. Pettit. Jun. 1979. 145 p. refs.
(Contract F44620-76-C-0123; AF Proj. 2306)
(AD-A072645; PWA-FR-11545; AFOSR-79-0905TR) Avail: NTIS HC A07/MF A01 CSCL 11/6

The hot corrosion attack of metals and alloys has been examined over an extensive range of experimental conditions in order to develop a hot corrosion theory. Experiments have been performed at temperatures from 700 to 1000 C in air and in gases containing oxygen and SO3. Sodium sulfate was the principal deposit used to induce attack and the effects of NaCl and carbon in the Na2SO4 was also studied. Nickel- and cobalt-base alloys containing various amounts of chromium, aluminum, molybdenum and tungsten constituted the principal materials studied. The hot corrosion attack of alloys has been found to consist of an initiation stage and a propagation stage. The factors which determine the length of the initiation stage and the type of propagation mode are shown to be: alloy composition, fabrication condition, gas composition and velocity, salt composition, salt deposition rate, condition of salt, temperature, temperature cycles, erosion and specimen geometry. The hot corrosion propagation modes are described and shown to consist of fluxing processes and processes involving the oxidation of phases formed in alloys as a result of reaction with components in the deposit (e.g. sulfides, chlorides). The effects produced by a number of different elements (e.g. Cr, Al, Mo, W) on the hot corrosion of alloys is examined. It is shown that by using the unified theory for hot corrosion, previous inconsistencies are resolved. GRA

CORROSION FATIGUE OF A MARINE ALUMINUM ALLOY (5456-H343) IN THE PRESENCE OF SHALLOW CRACKS. M.S. Thesis
Terrence L. Tinkel. Jun. 1978. 147 p. refs.
(AD-A072562) Avail: NTIS HC A07/MF A01 CSCL 11/6

Marine aluminum alloy 5456-H343 is a candidate primary structural material for naval high performance ships. This material in the form of 1/8 inch sheet was used to obtain initial alternating surface stress v. cycles to failure data in air and salt water. Room temperature tests were performed using deflection controlled fully reversed bending at 30 Hz. Data were obtained for smooth and shallow, sharply notched specimens for fatigue lives up to 10 million cycles. Notches were semi-elliptical surface cracks with depths equal to .002 in., .0115 in., and .025 in. The 5456-H343 showed excellent corrosion fatigue resistance in salt water, with increasing environmental sensitivity in the range of 1-10 million cycles. The material exhibits some notch sensitivity at a fatigue life of 10 million cycles. The following fatigue design/failure criterion were developed: (1) for shallow cracks less than .001 in. deep, the maximum fatigue stress is determined by endurance limit or fatigue strength of smooth specimens, and (2) for shallow cracks greater than .020 in. deep, the maximum fatigue stress is determined by the threshold or allowable stress intensity factor of notched specimens. EVALUATION OF YTTRIATED TITANIUM 6 Al-4 V PLATES AND FORGINGS. Final Report, Jun. 1975 - Aug. 1978
A. E. Gunderson and R. F. Geisendorfer. Jan. 1979. 124 p. refs.
(AF Proj. 2418)
(AD-A072439; AFML-TR-78-158) Avail: NTIS
HC A06/MF A01 CSCL 11/6

This program evaluated the effects of yttrium additions to titanium 6Al-4V alloy by means of mechanical property testing and metallurgical studies. Product forms evaluated which contained yttria (yttrium oxide) included hand forgings, die forgings, and plate material which were compared to baseline plate material which had no yttria additions. The summary of results of the mechanical property evaluations are presented below. Certain heats and specimens did appear as outliers from the norm and these have been noted. Metallographic evaluations of the yttriated material demonstrated the yttria particles are readily observable by optical and scanning electron microscopy. Fracture surface analysis on the failed fatigue and tensile specimens did not establish a direct correlation between specimen performance and yttria particles or clusters. These results indicate the effects of yttria additions are indirect and more subtle, and that the variations in data are more likely to be a consequence of the differences in mill processing procedures due to the greater hot workability of the yttriated titanium. A PHENOMENOLOGICAL MECHANISM FOR THE OCCURRENCE OF THE EXTRUSION CENTRAL BURST DEFECT. Interim Technical Report, 15 Feb. 1978 - 10 Jan. 1979
F. J. Gurney. Wright-Patterson AFB, Ohio: AFML, Apr. 1979. 31 p. refs.
(Contract F33615-78-C-5003; AF Proj. 2418)
(AD-A072476; FM-TR-79-4031) Avail: NTIS
HC A03/MF A01 CSCL 11/6

Six billets of 7075 Al were partially extruded in a horizontal extrusion press using a three-inch diameter container. Extrusion conditions were selected such that the central burst defect would occur. A rigid ram stop mechanism was employed to halt the extrusion process abruptly after selected increments of deformation were achieved in each billet. Both metallographic and scanning electron microscopy analyses were used to identify the mechanism for occurrence of the defect. The occurrence of the defect was found to be preceded by the development of tangential velocity discontinuity surface in the deformation zone. Enhanced metal flow in the radial direction on the die exit side of this discon-

tinuity surface caused tensile stresses to develop along the axis of the billet initiating the defect by a tensile overload mechanism. The defect was found to propagate along the discontinuity surface but was halted when continued ram motion caused continued plastic flow along this discontinuity surface to become diffused. GRA

ADSORPTION OF OXYGEN ON Pt (111) AND ITS REACTIVITY TO HYDROGEN AND CARBON MONOXIDE Interim Report
David R. Monroe and Robert P. Merrill Oct. 1978 23 p
(Grant AF-AFOSR-2926-76; AF Proj. 2303)
(AD-A072710; AFOSR-78-1432TR) Avail: NTIS HC A02/MF A01 CSCL 07/2

Oxygen was found to adsorb on Pt(111) with an initial sticking coefficient of 0.048 - or - .006 and linear adsorption kinetics. The surface saturated at an oxygen to platinum ratio of 1:4. The reactivity of adsorbed oxygen to hydrogen and CO was determined from steady state oxygen coverages for H2-O2 and CO-O2 mixtures. From the reactivity data which show reaction probabilities of 1.0 for CO and 1/2 for H2 over a wide range of oxygen coverages, it is concluded that both H2 and CO are reactive in mobile states which are probably the precursors to adsorption. ASSESSMENT OF THE STATE OF KNOWLEDGE PERTAINING TO SOLID PARTICLE EROSION Final Report
William F. Adler 30 Jun. 1979 153 p refs
(Contract DAAG29-77-C-0039)
(AD-A073034; ETI-CR79-680; ARO-14980.1-MS) Avail: NTIS HC A08/MF A01 CSCL 11/6

This investigation examines the analyses of solid particle erosion which have been formulated for both ductile and brittle materials. The solid particle erosion process can be described qualitatively for several materials from microscopic examinations of the eroded surfaces; however, most of the available erosion analyses are based on material removal models which do not represent the physical processes of material removal as they are presently known. A number of published results have been generally accepted by the erosion community without proper scrutiny of the basis for the conclusions reached. Some of these inconsistencies are pointed out, and the various analytical approaches used in describing solid particle erosion phenomena are summarized. The need for an adequately characterized solid particle erosion testing capability is indicated due to the range of test parameters, which have been found recently to significantly influence the measured erosion rates. Meaningful advancement in the field is strongly dependent on the development of a reliable experimental data base and experimentation which isolates and clarifies a particular feature of the material removal process. THE RESPONSE OF COATED STEELS TO CAVITATION IN CORROSIVE ENVIRONMENTS
H. Herman, C. R. Clayton, M. Dorfman, S. Safai, and J. Vargas Mar. 1979 64 p refs
(Contract N00014-75-C-1018)
(AD-A072841; TR-4) Avail: NTIS HC A04/MF A01 CSCL 11/6

This ONR-supported program has concentrated on the cavitation-erosion behavior of thermal-sprayed coatings on steel in distilled and in salt water. The coatings have been Zn, Al and Zn-150 w/o Al. Porosity is a major cause of failure in a cavitation field, and further work is proposed whereby the porosity can be controlled and the coatings examined both from the points of view of corrosion (visually and electrochemically) and cavitation-erosion (visually and with weight-change measurements). The microstructures of both oxide and metal coatings have been examined through X-ray diffraction and using scanning and transmission electron microscopy techniques. Aside from active coatings, it is also desired to examine thermally-sprayed stainless steels, exothermic coatings and sprayed metallic glass forming materials. Acoustic emission (AE) is being developed as an important tool for coating evaluation. It is one goal to relate AE measurements to cavitation-corrosion survivability. GRA

FRACTURE AND FATIGUE PROPERTIES OF 1Cr-Mo-V BAINITIC TURBINE ROTOR STEELS
I. Roman, C. A. Rau, Jr., A. S. Tetelman, and K. Ono Mar. 1979 268 p refs
(EPRI Proj. 700-1)
(EPRI-NP-1023) Avail: NTIS HC A12/MF A01

The deformation, fracture and fatigue properties of 1Cr-Mo-V turbine rotor steel have been evaluated for a wide range of loading conditions and metallurgical structures controlled by melting and heat treatment practice. The mechanical property differences and corresponding metallurgical differences between older, air-melted steels and newer heats that are vacuum degassed were determined. The effects of prior fatigue cycling on fracture toughness were measured, and a model was developed to predict the effect for various materials and loading conditions. Irrespective of the fracture mode, materials which soften under strain cycling, like this rotor steel, show a toughness which increases with number and magnitude of prior fatigue cycling. DOE

LOW TEMPERATURE HEAT CAPACITY STUDIES ON HYDROGEN ABSORBING INTERMETALLIC COMPOUNDS
T. Takeshita, G. Dublon, O. D. McMasters, and K. A. Gschneidner, Jr. 1979 5 p refs Presented at Rare Earth Res. Conf., Fargo, N.D., 25 Jun. 1979
(Contract W-7405-eng-82)
(IS-M-210; Conf-790641-4) Avail: NTIS HC A02/MF A01

Low temperature heat capacities of some ternary Hauke compounds were studied. The electronic specific heat constants of these compounds decrease as Ni is substituted with Al or Cu. The Debye temperatures show some variations but not in a systematic manner for the aluminum substitution. In the aluminum substituted ternaries, there is no correlation between the hydrogen absorption capacity with the electronic specific constant and the Debye temperature except for ThNi2Al3. In the pseudo-binary system, LaNi5 - /sub x/Cu/sub x/, the stability of the metal hydride may be rigidity of the metal lattice, i.e., softer the metal lattice the more related to the stable the metal hydride. This is in agreement with our previous observations. DOE

EFFECT OF PERIODIC CHEMICAL VARIATION ON THE MECHANICAL PROPERTIES OF Ta FOILS
R. W. Springer, N. L. Ott (St. Joseph's College, Philadelphia), and D. S. Catlett 1978 11 p refs Presented at 25th Natl. Am. Vacuum Soc. Symp., San Francisco, 27 Nov. - 1 Dec. 1978
(Contract W-7405-eng-36)
(LA-UR-78-3065; Conf-781130-5) Avail: NTIS HC A02/MF A01

Acetylene gas was admitted to the chamber over approximately two orders of magnitude of pressure during Ta deposition. Residual gas analysis was used to verify that a reaction between the Ta film and the gas occurred. Subsequent Auger analysis showed that the carbon in the films could be predicted using simple pressure vs rate equation. The pulse gas process (PGP) has been applied to the electron beam gun deposition of Ta. Tensile test specimens a few micro-meters thick have been produced to show fracture strengths varying from approximately 170 MPa to approximately 860 MPa for pure to highly pulsed runs. The fracture strength loosely follows a Hall-Petch relation fracture strength to the time between pulses. Although diffusion of the carbon smoothes out the chemical period, it is thought that the remaining structure accounts for the strength enhancement. DOE

DUCTILITY MINIMUM AND ITS REVERSAL WITH PROLONGED AGING IN COBALT-AND NICKEL-BASE SUPERALLOYS
1978 15 p refs Presented at ASME Meeting, San Francisco, Calif., 10 Dec. 1978
(Contract W-7405-eng-26)
(CONF-781202-35) Avail: NTIS HC A02/MF A01

The cobalt-base superalloys Haynes alloy No. 25 and Haynes alloy No. 188 and the nickel-base superalloy Inconel 625 show a pronounced ductility minimum at temperatures of 760 and 704 C, respectively, in the solution-annealed condition. However, after prolonged (11,000 h) aging at 816 C (1500 F), copious precipitates form to completely reverse the behavior. These precipitates reduce tensile ductility drastically up to temperatures where the ductility dip is observed for the solution-annealed condition; then the brittle behavior from aging gives way to greatly enhanced ductility. This behavior in Haynes alloy No. 25 is examined in detail. Its tensile properties in the solution-annealed and 816 C-aged conditions are correlated with mode of fracture and the amounts, identity, and morphology of the precipitates. The latter were assessed by optical and scanning electron metallography, microhardness, electron microprobe, and X-ray diffraction. The minimum and its reversal are explained by thermally activated processes, which began with the onset of recovery. DOE

STUDY OF METAL-OXYGEN SOLID SOLUTIONS UTILIZING SOLID ELECTROLYTIC CELLS Ph.D. Thesis
Robert John Lauf Oct. 1978 104 p refs
(Contract EY-76-C-02-1198)
(COO-1198-1216) Avail: NTIS HC A06/MF A01

A study was made of the thermodynamic and kinetic behavior of oxygen in a number of Group V metals and alloys. Investigations were made with a ThO_2/Y_2O_3 electrolyte over the temperature range of 600 to 1150 C (873 to 1423 K). The activity of oxygen in three Nb-Ta alloys (nominally 25, 50, and 75 at. % Ta) was found to obey Henry's Law up to the solubility limit in each alloy. The standard entropy and enthalpy of solution of oxygen in the three Nb-Ta alloys were intermediate between those for pure niobium and pure tantalum, and varied almost linearly with Nb : Ta content. The diffusion coefficient of oxygen was measured in niobium and vanadium, and the values were found to be in excellent agreement with literature values obtained by a variety of techniques. The diffusion coefficient of oxygen in each of several dilute substitutional niobium alloys was measured and compared to the diffusion coefficient in pure niobium. The addition of 1 to 5% substitutional solutes resulted in as much as an order-of-magnitude decrease in the oxygen diffusivity. DOE

HIGH PRECISION METAL STABLE ISOTOPE RATIO MEASUREMENTS USING VOLATILE METAL CHELATES
D. L. Hachey, J. Johnston, and P. D. Klein 1978 15 p refs Presented at 3d Intern. Conf. on Stable Isotopes, Oak Brook, Ill., 23 May 1978
(Contract W-31-109-eng-38)
(CONF-780501-7) Avail: NTIS HC A02/MF A01

A series of volable metal chelates were prepared for magnesium, calcium, iron, and cadmium. Extraction efficiency studies were done for magnesium and calcium in order to define the optimum conditions of pH and chelating agent required for recovery of these elements from aqueous media. Mass spectra of these chelates were obtained to evaluate their suitability for the measurement of metal stable isotope ratios. Chemical ionization mass spectrometry is most useful for the measurement of transition metal isotope ratios but electron ionization mass spectrometry is required for measurement of calcium and magnesium isotope ratios, since these elements are extensively polymerized in the gas phase. Isotope ratios can be measured to an absolute accuracy of +-0.03 to 0.72 percent, depending on the element, the ionization technique and the magnitude of the isotope ratio. The natural abundance can be determined in a single run for as many as eight isotopes or one element with better than +-0.48 percent accuracy when corrected for the natural abundance of C(13), H(2), and O(18) present in the chelating agent. EFFECTS OF IMPURITIES ON THE WELDABILITY OF ELECTROFORMED NICKEL
J. A. Brooks, J. W. Dini, and H. R. Johnson Dec. 1978 36 p refs
(NASA Order-L-50230A; Contract EY-76-C-04-0789)
(NASA-CR-162455; SAND-78-8774) Avail: NTIS HC A03/MF A01 CSCL 11F

The effect of impurities on weld cracking of electroformed nickel was studied using gas tungsten arc welding, varestraint testing and hot ductility testing. High purity electroformed nickel was found to be very resistant to weld cracking; furthermore, intentional additions of copper and iron to levels above those commonly observed in electrodeposits had no detrimental effects on welding. However, nickel electrodeposits with sulfur and lead impurities were found to exhibit increased susceptibility to weld cracking with increasing impurity content. High levels of carbon, oxygen, and nitrogen result in intergranular porosity of the weld heat affected zone and this leads to weld cracking resulting from locally reduced strength and ductility. Other cracking mechanisms resulting from impurities are proposed. DOE

CATALYSIS BY TRANSITION METAL COMPOUNDS Ph.D. Thesis
David Lee Klein 1978 153 p refs
(Contract EY-76-C-02-1198)
(COO-1198-1234) Avail: NTIS HC A08/MF A01

The catalytic properties of cobalt oxide were investigated theoretically. The interactions of atomic hydrogen with small clusters of atoms, respresenting cobalt oxide surfaces, were calculated using the ab initio Unrestricted Hartree-Fock method. The electronic structure of the bulk solid was studied through band and cluster models. The bulk electronic structure computed predicts insulating behavior for cobalt oxide and agrees with experimental optical results. The perfect (100) cobalt oxide surface was determined not to chemisorb atomic hydrogen. Singly-ionized oxygen ions located near cation vacancies were found to chemisorb hydrogen, forming two-center covalent bonds. The effect of lattice defects on the creation of singly ionized oxygen ions was examined. A systematic procedure for the study of surface and bulk electronic properties is discussed. DOE

A CREEP DATA LIBRARY FOR DTD 5070A ALUMINUM ALLOYS
J. N. Webb London Dec. 1976 17 p refs Document includes a microfiche supplement. This supplement is available in microfiche on request from the NASA Scientific and Technical Information Facility
(RAE-TR-76067) Avail: NTIS HC A02/MF A01

Tensile creep and strain recovery data, accumulated during an investigation into creep behavior under varying load conditions of an aluminum alloy suited to airframe applications at elevated temperature, are presented. The data is of high quality as special attention was paid to the control of temperature, load, and load axiality. Data are included from continuous creep tests over a range of stresses (80 to 250 MM/sqm) and temperatures (150 to 195 C) as well as from tests, mainly at 180 C, involving prior heating and step changes in load level. Particular attention was paid to transient response and the effect of strain recovery periods. Each test phase was accurately fitted with a polynomial; computer printouts were obtained listing time, measured and fitted strain, strain rate, and the second derivative together with the polynomial coefficients. These collected printouts comprise the library of creep data which are presented in microfiche form. Author (ESA)

(Contract FMV-F-FL-82223-76-001-21-001)
(FFA-TN-HU-1943) Avail: NTIS HC A03/MF A01

A fatigue investigation of surface treated aluminum AZ 74 (3633-4) is reviewed. The test specimens were turned and notched (K = 1.5). The loading was axial tension with R = 0. The separate processes used in treatment and some ten process variants are detailed. Owing to a limited number of test specimens, the investigation only admits rough estimations. However, process variants supposed to be detrimental, but not appearing so, as well as variants associated with considerable improvements point to the necessity of attention to details in anodizing processes. FATIGUE TESTING OF PRECIPITATING STEEL 1745

(CUSTOM 455) WITH MACHINING AS THE FINAL PROCESS
Nils Larsson 1979 35 p
(Contract FMV-F-K-82223-76-001-21-001)
(FFA-TN-HU-1965) Avail: NTIS HC A03/MF A01

Results from fatigue testing of turned specimens of a precipitation hardened steel are presented. The specimens were either plain or notched (K = 2.5 and K = 4.0) with machining as the final process. The fatigue testing was carried out with R = -1, R = 0, and sigma min = 300 N/sq mm. Supplementary static tests were performed. The ultimate tensile strength for plain specimens was 1612 N/sq mm. The fatigue results are presented as S-N curves and are also revised to Haig diagrams. Notch fatigue factors (Kf) were calculated and are shown.

ANALYSIS OF THE INFLUENCE OF SPACE CONDITIONS UPON REACTIONS BETWEEN LIQUID AS WELL AS GASEOUS CORROSIVE AGENTS AND METALS Final Report
Guenther Mix Bonn Bundesmin. fuer Forsch. u. Technol. Dec. 1977 150 p refs In GERMAN; ENGLISH summary
(Contracts BMFT-SLN-7751; DFVLR-BPT-01-QV-205-B22)
(BMFT-FB-W-77-10) Avail: NTIS HC A07/MF A01; ZLDI, Munich DM 31.30

In order to eliminate the deleterious influence of convection on research into chemical reactions between aquatic electrotypes and metallic surfaces, a low gravity environment is necessary. A comprehensive evaluation of the literature describing liquid mechanics under low gravity conditions is given in support of the use of SPACELAB for this type of study. Advantages cited include a gravitational field of 1/10,000 g, a low temperature gradient, and a low concentration gradient. It is shown that material transport depends on diffusion only under these conditions. Six experiments are proposed; i.e. the measuring of the double-layer capacity and the adsorption on metallic surfaces, corrosion of homogeneous metals, pitting corrosion, and cathodic protection against corrosion. ON THE INFLUENCE OF NICKLE ON TOUGHNESS AND DUCTILE-BRITTLE TRANSITION IN LOW-CARBON LATH MARTENSITE STEELS
Lars-Aake Norstroem (Uddeholms AB) Jun. 1978 36 p refs
(UPTEC-78-53-R) Avail: NTIS HC A03/MF A01

The ductile-cleavage transition was studied with respect to grain size, yield strength, and nickel content by impact testing of low-carbon (< 0.1 percent C) lath martensite steels with 5% Mn, 5% Ni, and 9% Ni. The impact transition temperature (ITT) is found to be controlled by the martensite packet size and the yield strength. Regardless of packet size and yield strength, nickel additions imply powerful intrinsic toughness improvments while decreasing the ITT by as much as 20 C per percent nickel. At the same time, nickel moderated the effect of packet size and yield strength on ITT. These important effects of nickel additions are mainly attributed to a corresponding increase in cleavage fracture resistance and form the basis for the use of Ni-steels in cryogenic applications. FATIGUE TESTING OF FORGED TITANIUM
Nils Larsson Feb. 1979 31 p
(Contract FMV-F-FL-82223-77-001-21-001)
(FFA-HU-1997) Avail: NTIS HC A03/MF A01

Results from fatigue testing with specimens of forged titanium AMS 4971 satisfying the Saab-Scania specifications 6466-2 and 6466-3 are presented. The specimens were taken longitudinally as well as transversely from six similar forgings. They were turned and either plain (k sub t = 1.0) or notched (k sub t = 2.5 and 4.0). The fatigue testing was carried out with r = -1, R = 0, and sigma min = 250 N/sq mm. Supplementary static tests were performed. The ultimate tensile strength for plain specimens was 1020 and 1230 N/sq mm for 6466-2 and 6966-3, respectively. Most of the fatigue testing was devoted to 6466-2 returning seven S-N curves. Comparisons between the two conditions (6466-2, 6466-3) and the two forging directions (longitudinal, transverse) were made in the case k sub t = 2.5/R = 0. No marked differences were noticed. Large scatter was noticed for 6466-2 in the case k sub t = 1.0/R = 0.

DETERMINATION OF PHYSICAL AND CHEMICAL STATES OF LUBRICANTS IN CONCENTRATED CONTACTS, PART 1 Final Report
James L. Lauer Washington NASA Nov. 1979 58 p refs
(Grant NsG-3170)
(NASA-CR-3204) Avail: NTIS HC A04/MF A01 CSCL 11H

A Fourier emission infrared microspectrometer, set up on a vibration-proof optical table and interfaced to a dedicated minicomputer, was used to record infrared emission spectra from elastohydrodynamic bearing contacts. Its range was extended to cover the entire mid-infrared from 2 to 15 micron. A series of experiments with 5P4E polyphenyl ether showed the existence of a temperature gradient through the lubricant in an ehd contact, which is perpendicular to the flow direction. The experiments also show marked polarization of some of the spectral bands, indicating a molecular alignment. Alignment is less evident at high pressure than at low pressure. To account for this behavior, a model is suggested along the lines developed for the conformational changes observed in long-chain polymers when subjected to increased pressure--to accommodate closer packing, molecules become kinked and curl up. Experiments with a traction fluid showed periodic changes of flow pattern associated with certain spectral changes. These observations will be studied further. A study by infrared attenuated total reflection spectrophotometry was undertaken to determine whether gamma irradiation would change polyethylene wear specimens. The results were negative. A.R.H.

ELECTRON AND PROTON ABSORPTION CALCULATIONS FOR A GRAPHITE/EPOXY COMPOSITE MODEL
Edward R. Long, Jr. Nov. 1979 33 p refs
(NASA-TP-1568; L-13073) Avail: NTIS HC A02/MF A01 CSCL 11G

The Bethe-Bloch stopping power relations for inelastic collisions were used to determine the absorption of electron and proton energy in cured neat epoxy resin and the absorption of electron energy in a graphite/epoxy composite. Absorption of electron energy due to bremsstrahlung was determined. Electron energies from 0.2 to 4.0 MeV and proton energies from 0.3 to 1.75 MeV were used. Monoenergetic electron energy absorption profiles for models of pure graphite, cured neat epoxy resin, and graphite/epoxy composites are reported. A relation is determined for depth of uniform energy absorption in a composite as a function of fiber volume fraction and initial electron energy. Monoenergetic proton energy absorption profiles are reported for the neat resin model. A relation for total proton penetration in the epoxy resin as a function of initial proton energy is determined. Electron energy absorption in the composite due to bremsstrahlung is reported. Electron and proton energy absorption profiles in cured neat epoxy resin are reported for environments approximating geosynchronous earth orbit. R.C.T.

HC A05/MF A01 CSCL 11/1

The performance properties of thermosetting polymer systems which are cured with the application of heat and pressure generally surpass those obtained with ambient temperature cures for the same systems. This report describes a program of research and development comprising the exploration and study of selected novel ambient temperature curing techniques with the goal of obtaining performance characteristics equaling or surpassing those achieved with conventional heat/pressure type cures. The specific room temperature curing methods experimentally investigated included electron beam radiation; flash polymerization; interfacial polymerization and anaerobic cures. Some experiments were also carried out on room temperature curing epoxy polymer systems with high temperature service capabilities. GRA

TOXICITY AND THERMAL PROPERTIES OF POLYPHOSPHAZENES Interim Report

P. J. Lieu, J. H. Magill, and Y. C. Alarie 19 Jul. 1979 37 p refs

(Contract N00014-77-C-0310)

(AD-A072120; SETEC-MME-79-40; TR-3) Avail: NTIS HC A03/MF A01 CSCL 07/3

Flammability and toxicity of various polyphosphazenes with and without fillers have been measured. The performance characteristics of these polymers are compared with other more conventional plastics of commercial interest. Other small scale tests such as limiting oxygen index, at different heat fluxes, have been used as indicators of flammability. Under ambient conditions, polyphosphazenes require a higher oxygen concentration to burn than air alone can supply. LOI values always decrease as heat flux or ambient temperature is raised. Fillers also influence LOI measurements. Foam samples burn more readily than films of the same chemical constitution. RD(50) and LC(50) values were obtained by exposing animals (mice) to a gaseous stream of polyphosphazene decomposition products. The respiratory response of mice is directly correlatable with the rate of polymer decomposition. The toxicity of a particular polyphosphazene depends strongly upon the type of the side groups on the phosphorus. There is no direct correlation between toxicity hazard and CO concentration in these polymers. Halogen side groups give rise to the most toxic products. Based upon an overall hazard rating involving thermal stability, flammability and toxicity parameters, halogen free polyphosphazenes are favored over halogen containing polymers for high temperature applications. EFFECT OF CHEMICAL ENVIRONMENTS ON THE FRACTURE OF CERAMIC SURFACES

Robert E. Cuthrell 1978 18 p refs Presented at Symp. on Ceram. Machining and Surface Finishing, Washington, D.C., 13 Nov. 1978

(Contract EY-76-C-04-0789)

(SAND-78-1664C; Conf-781143-1) Avail: NTIS HC A02/MF A01

Environmental effects on the deformation and fracture of a variety of materials during drilling/grinding and four point bending to failure were traced to embrittlement by hydrogen. The extent of embrittlement is determined by the availability of hydrogen in the drilling fluid or in the gaseous environment in an ultrahigh vacuum chamber. The hydrogen availability is in turn dependent on its binding in liquids (ionic, covalent, ion paired in media of low dielectric constant) or by the blocking effect of adsorbed carbon monoxide in the vacuum chamber. These hydrogen effects are shown in drilling rates, maximum strain to fracture, acoustic emission amplitude (energy) distributions accompanying fracture, and scanning electron microscope photomicrographs of the fracture surfaces. COMPARISON OF POLYMER FLAMMABILITIES AND A DETERMINATION OF THE LOSS OF FIRE RETARDANT ADDITIVES WITH AGING

R. L. Clough and E. A. Salazar 1979 9 p refs Presented at JOWOG-28, Albuquerque, N. Mex., 11 Jun. 1979

(Contract DE-AC04-76DP-00789)

(SAND-79-0978C; Conf-790632-2) Avail: NTIS HC A02/MF A01

An investigation on the flammability of two major types of commercial cable insulation formulations that are widely used in nuclear applications is described. The effects of thermal and radiation aging on the combustion properties of these polymeric materials are studied including an evaluation of the potential loss of fire retardant additives. The two polymer types being studied are chlorosulfonated polyethylene (Hypalon) and ethylenepropylene rubber (EPR). The fire retardant system used commercially with both of these polymers consists of two components antimony trioxide and a chlorinated hydrocarbon. DOE

FURTHER MEASUREMENTS OF THE SPECIFIC HEATS AT LOW TEMPERATURES IN METALLIC GLASSES Final Report

T. B. Massalski 27 Sep. 1978 8 p refs

(UCRL-13908) Avail: NTIS HC A02/MF A01

The effect of the crystallization on the electronic structure and on certain lattice properties of amorphous alloys, Pd-Si and Pd-Si-Cu is presented. The temperature dependence of the low temperature specific heats for nonmagnetic amorphous alloys was established. The customary fitting equation C = gamma T + alpha T cubed + delta T to the 5th power was found to describe adequately the data for all amorphous samples studied. The linearly temperature dependent term gamma T, which measures the density of states at the Fermi level after the correction for the electron-phonon interaction and the noncrystalline effect, was found to be strongly dependent on composition. A large, broad maximum was observed at about 19 at. percent Si in the binary system. The interaction of the conduction electrons with the first peak of the structure factor S(q) was studied. DOE

CHARACTERIZATION OF LOW DENSITY RIGID URETHANE FOAM

F. N. Larsen Oct. 1978 20 p refs

(Contract EY-76-C-04-0613)

(BDX-613-1890-Rev) Avail: NTIS HC A02/MF A01

The chemical and mechanical properties of a low density, rigid polyurethane foam material taken from a Joint Test Assembly after 13 years of storage were measured. The chemical composition was Bendix Rigifoam 6003-1.5, a pentaerythritol/epsilon-caprolactone/tolyene diisocyanate polyurethane foam. Comparison of data from testing the thermal and mechanical characteristics with data from a currently manufactured foam of identical composition indicates no degradation of properties had occurred. This information gives added confidence to the stockpile lifetime integrity of the Rigifoam 6003-2 foam system designated for use in other programs. DOE

SHELF LIFE DETERMINATION OF EPOXY PREPREGS AND FILM ADHESIVES Final Report

B. G. Parker Jan. 1979 24 p refs

(Contract EY-76-C-04-0613)

(BDX-613-2033-Rev) Avail: NTIS HC A02/MF A01

Kinetic data describing the cure of a Kevlar/epoxy prepreg and an epoxy film adhesive were determined by the use of Differential Scanning Calorimetry. For the Kevlar/epoxy prepreg, a correlation was found between the heat of reaction and percent resin flow; a similar correlation was found between the heat of reaction and lapshear strength for the film adhesive. An equation was derived for the determination of the B stage time required to yield an epoxy prepreg possessing the desired flow properties. The effects of storage temperature on the shelf-life of both the prepreg and film adhesive were determined. DOE

THERMAL EXPANSION OF GLASSES AT LOW TEMPERATURES Ph.D. Thesis - Iowa State Univ.

K. G. Lyon Jan. 1979 89 p refs

(Contract W-7405-eng-82)

(IS-T-829) Avail: NTIS HC A05/MF A01

The linear thermal expansion coefficient was measured at temperatures to 1.2 K for two amorphous solids, fused silica

and plexiglas, using a parallel plate capacitor differential dilatometer. The low temparature expansion coefficients for these solids have the same temperature dependences as the specific heats, and show a contribution which is linear in the temperature and which can be associated with the postulate of a broad distribution of two level states. The Grueneisen parameters which are associated with this contribution are comparable for the two solids, and suggest a further indication of common behavior for amorphous solids at low temparature. Large magnitudes for Grueneisen parameters generally are associated with tunneling models. A symmetric double harmonic oscillator funneling model can be used to understand the sign and magnitude of gamma for these solids. This model is inconsistent with other thermal and thermodynamic data for fused silica. DOE

ETCHING STUDY FOR THE MC2980 GLASS CERAMIC PREFORM
S. T. Reed and C. R. Abrams. Nov. 1978. 23 p. refs.
(Contract EX-76-C-04-0789)
(SAND-78-1295). Avail: NTIS. HC A02/MF A01.

Variables of the etching process for the MC2980 glass ceramic preform were studied to determine their effect upon the etching rate. These variables include: type of agitation on the preform, temperature of the etchant, duration of etch, surface finish of preform, depletion of etchant, evaporation of etchant, and interruption of etching cycle. The etching rate varied from 0.18 g/min at room temperature to 1.31 g/minute at 80 C. A constant etching rate, at elevated temperatures using the same batch of etchant, could not be maintained because of evaporation losses and the depletion of the etchant. The vapor-honed surface layer of the preform was removed after 10 min of etching at room temperature and only 2 min of etching at 80 C. DOE

MEASUREMENT OF DIFFUSION COEFFICIENTS OF SHORT-LIVED SPECIES IN SOLUTION AND IN AMORPHOUS GLASSES. Final Report, 1 May 1967 - 31 Aug. 1978
R. D. Burkhart. Aug. 1978. 36 p. refs.
(Contract EY-76-S-08-0535)
(NVO-0535-7). Avail: NTIS. HC A03/MF A01.

The diffusion coefficients of 1-propyl, 1-pentyl, 1-dodecyl, 1-octadecyl cyclohexyl and benzyl radicals were measured in hydrocarbon solvents at room temperature using the method of photochemical space intermittency. The results indicate that strong radical-solvent interactions exist for all but the benzyl radical. Solvent effects observed are those to be expected from changes in viscosity. Measurements of triplet energy transfer between molecules in polystyrene matrices show that the energy transfer probability is a decreasing exponential function of the average separation distance of solute molecules. Triplet energy migration was studied in solid films of poly(N-vinyl carbazole) (PVCA). Effects of temperature on intensities and lifetimes of PVCA phosphorescence and delayed fluorescence were determined and a PVCA delayed luminescence spectrum at room temperature was obtained. DOE

GLASS FIBRE REINFORCED, SPRAYED COATING FOR SEALING THERMAL INSULATION CONTAINING ASBESTOS
P. H. Crum, inventor, B. Godfrey, inventor, R. D. Hunt, inventor, and T. K. Marston, inventor. May 1979. 4 p.
(TDB-325). Avail: NTIS. HC A02/MF A01.

A method of sealing asbestos insulation was developed. It consists of simultaneously spraying short glass fiber rovings and certain water based paints of the type commonly used for sealing asbestos such that the two components mix and form, when dry, a tough membrane reinforced with randomly orientated fiber. Spraying tests were run at two electric power stations. Results show that the sprayed coatings are superior to other coatings as they extend more before perforation and are much more resistant to tearing and impact damage. Author (ESA)

ECONOMICS OF HYDROGEN PRODUCTION AND LIQUEFACTION UPDATED TO 1980
C. R. Baker. Nov. 1979. 41 p. refs.
(Contract NAS1-14698)
(NASA-CR-159163). Avail: NTIS. HC A03/MF A01. CSCL 21D.

Revised costs for generating and liquefying hydrogen in mid-1980 are presented. Plant investments were treated as straight-forward escalations resulting from inflation. Operating costs, however, were derived in terms of the unit cost of coal, fuel gas and electrical energy to permit the determination of the influence of these parameters on the cost of liquid hydrogen. Inflationary influence was recognized by requiring a 15% discounted rate of return on investment for Discounted Cash Flow financing analysis, up from 12% previously. Utility financing was revised to require an 11% interest rate on debt. The scope of operation of the hydrogen plant was revised from previous studies to include only the hydrogen generation and liquefaction facilities. On-site fuel gas and power generation, originally a part of the plant complex, was eliminated. Fuel gas and power are now treated as purchased utilities. Costs for on-site generation of fuel gas however, are included. A.R.H.

INFRARED OPTICAL PROPERTIES OF BIPROPELLANT CRYOCONTAMINANTS Interim Report, 1 Oct. 1977 - 15 Mar. 1979
J. A. Roux, B. E. Wood, and A. M. Smith Arnold AFB AEDC Aug. 1979 123 p refs
(AD-A073186; AEDC-TR-79-50) Avail: NTIS HC A06/MF A01 CSCL 17/5

The infrared spectral transmittance of cryofilms formed by MMH, N2O4, and N2H4 propellants was measured. These films were cryopumped on 20 and 77K germanium substrates and ranged in thickness from 0.25 to 9 microns; the deposition pressure for the films was approximately 1 x 10-7 torr. Transmission spectra were obtained for the 500 to 3700 wavenumber range using a Fourier transform spectrometer. Values of the complex index of refraction for the cryodeposits were derived from the experimental data using an analytical model and a nonlinear least-squares method. The analytical model treats the germanium as a thick, noninterfering film and the deposit as a thin film. Results from the least-squares method are also compared with a Kramers-Kronig determination of the real part of the index of refraction. The optical properties of such cryofilms are essential for predicting the degradation of cryocooled optical surfaces contaminated by liquid propellant exhaust plumes. GRA

(Contract EC-77-C-03-1543)
(SAN-1543-12) Avail: NTIS HC A05/MF A01

The development of fuel-flexible combustion systems for gas turbines as well as Rankine and Stirling cycle engines is presented. An improved understanding was developed of relationships between alternate fuel properties and continuous combustion system effects, and to provide analytical modeling/correlation capabilities to be used as design aids for development of fuel-tolerant combustion systems. Experimental procedures were evaluated for studying alternate fuel combustion effects and to determine current analytical capabilities for prediction of these effects. Jet Stirred Combustor studies during this period produced new insights into soot formation in strongly back-mixed systems and have provided much information for comparison with analytical predictions. Applications of quasi-global modeling techniques were included as well as comparison of prediction with the experimental results generated. DOE

ECONOMICS OF GASOLINE PRODUCTION FROM UNDERGROUND COAL GASIFICATION VIA MOBIL M PROCESS
M. S. Edwards, W. C. Ulrich, and R. Salmon 1979 36 p refs Presented at AICE Meeting, Houston, Tex., 1 Apr. 1979
(Contract W-7405-eng-26)
(CONF-790405-12) Avail: NTIS HC A03/MF A01

A conceptual process design and cost estimate is presented for a facility producing approximately 15,000 barrels per day of M-gasoline via methanol from synthesis gas generated by gasification of coal in situ. The design was based on experimental data obtained at the Laramie Energy Technology Center on the linked vertical well in situ coal gasification process. In-place coal consumption is 756 Mg/h (20,000 tons/day), based on a subbituminous Wyoming coal. The capital investment was estimated to be $535 million in first quarter 1978 dollars. The product price of M-gasoline (including mixed butane LPG) is about $240/cubed m ($0.90/gal) at the plant gate. Calculated overall thermal efficiency for the facility was 22%, based on in-place coal. DOE

K. J. Scribner and G. J. Tanaka 2 Feb. 1979 23 p
(Contract W-7405-eng-48)
(UCRL-52659) Avail: NTIS HC A02/MF A01

The effects of a jet-fuel fire on the behavior of several plastic-bonded explosives of military interest were investigated. Eight small spherical explosive assemblies cased in stainless steel and containing thermocouples to record the ambient flame temperature at several points inside the assembly were fabricated. The explosive formulations contained HMX, TATB, NQ, or combinations of HMX with either TATB or NQ. When these units were tested, similar behavior for all formulations was observed. There were no detonations. Decomposition began at the outer surface of the high-explosive charge and proceeded slowly toward the center, and all casings vented under the pressure of the decomposition products. Thermograms showed that, under the test conditions, TATB is the most thermally stable and NQ is the least stable of the three explosives tested. DOE

PROGRAM TO DISCOVER MATERIALS SUITABLE FOR SERVICE UNDER HOSTILE CONDITIONS OBTAINING IN EQUIPMENT FOR THE GASIFICATION OF COAL AND OTHER SOLID FUELS Quarterly Progress Report, 1 Apr. 1978 - 30 Jun. 1978
A. O. Schaefer, ed. DOE 16 Oct. 1978 238 p refs
(Contract EX-76-C-01-1784)

(FE-1784-42) Avail: NTIS HC A11/MF A01

Progress is reported in screening materials for use in such plants with corrosive environments and in providing useful corrosion data as well as reliable information on other properties needed for the design, construction, and operation of such plants. The program involves high temperature corrosion studies involving low concentration of H2S, exposure of metal coupons and refractories in coal gasification pilot plants, aqueous corrosion erosion and corrosion testing, and measurements of the mechanical and physical properties of materials. RESEARCH AND DEVELOPMENT OF RAPID HYDROGENATION FOR COAL CONVERSION TO SYNTHETIC MOTOR FUELS (RISER CRACKING OF COAL) Quarterly Report, 1 Apr. - 30 Jun. 1978
D. A. Duncan, J. L. Beeson, and R. D. Oberle Sep. 1978 25 p refs
(Contract EX-76-C-01-2307)
(FE-2307-38; QR-1) Avail: NTIS HC A02/MF A01

Runs were made in the bench-scale unit to investigate hydrocarbon yields from North Dakota lignite at operating pressures of 500 and 1000 psig. The base carbon conversions were reduced to approximately 26 and 33%, and hydrocarbon liquids yields were reduced to 6.4 and 9.2 grams per 100 grams of feed carbon, respectively. These values are considerably lower than those obtained from North Dakota lignite in bench-scale unit operations at 2000 psig. At that pressure, base carbon conversions were approximately 50%, and hydrocarbon liquids yields were 18 grams per 100 grams of feed carbon. Runs were also made with Illinois No. 6 bituminous coal [free-swelling-index (FSI) - 4-1/2]. To avoid plugging the reactor, the coal was mixed with fine silica sand at levels of 10%, 20%, and 30% (by weight) coal with sand. The bench-scale unit was operated using an upsweeping temperature profile at coil outlet temperatures of 1450 and 1500 F and a system outlet pressure of 2000 psig. Runs with the 10% and 20% (by weight) coal were successful. DOE

BIOFUELS: A SURVEY
John R. Benemann Jun. 1978 96 p refs Sponsored by EPRI
(EPRI-ER-746-SR) Avail: NTIS HC A05/MF A01

Photosynthesis, plant productivity, waste and residue resources, 'energy farming,' processes for using biomass directly or converting it to fuels, and overall economics are discussed. Applications by U.S. industries and utilities are emphasized and current U.S. research and development programs presented. With foreseeable technologies and economics, approximately 5% of the fossil fuels now consumed in the United States could presently be replaced by available forestry, agricultural, and municipal wastes and residues. DETONATION OF EXPLOSIVES USING SEMICONDUCTING LAYERS [INITIATION D'EXPLOSIVES A COUCHES SEMICONDUCTRICES]
J. F. Vincent Jul. 1978 20 p ref In FRENCH
(Publ-368) Avail: NTIS HC A02/MF A01

Nonlinear layers to be combined with appropriate detonators for the electrical firing of explosives were developed in order to provide an elevation of the low voltage safety limit and a reduction of the operating point dispersion. Indirect operation in series with a conductive initiator and direct operation producing detonation by primary current heating of the nonlinear layer were investigated. The materials under study were OZN ceramics with the addition of 0.5 percent of Bi203 (binary system) and the same with the addition of 0.5 percent Mn02 (tertiary system). Results show that using a 100 nF condenser, an operation point of 150 volts with a + or - dispersion of 10 volts with the tertiary system is possible for indirect firing, while 400 volts and 1000 nF are necessary for direct firing. U. S. ARMY METRICATION ANALYSIS AND RECOMMENDATIONS FOR DA IMPLEMENTATION PLAN, VOLUME 1
M. J. Oetron, L. A. Roepcke, C. F. McFadden, S. E. Sugarek, and E. B. Peters 9 Jun. 1978 345 p refs
(Contract DAAG39-77-C-0108)
(AD-A069746) Avail: NTIS HC A15/MF A01 CSCL 05/1

Much has been learned about the metrication experiences and practices of foreign nations and U.S. companies. The most

crucial lessons learned from the experience of others which have relevance to the U.S. Army are briefly summarized below. (1) Metrication is inevitable. (2) Key to the Army's approach to metrication should be an evolutionary, least cost philosophy - including the concepts of keeping pace with industry, letting costs lie where they fall and employing flexible timetables and plans. (3) A strong, high level commitment to metrication is essential. (4) Planning and coordination are the keys to successful, least cost metrication, and the 'doers' (line management) should be the planners. (5) Only a small, dedicated metrication organization is needed. It can be supported by ad hoc working groups with membership drawn from the line organization. GRA

DEVELOPMENT EFFORTS ON A DIFFUSER AND PUMP INLET FOR A WATER JET PROPULSION SYSTEM
A. M. Yocum 4 Apr. 1979 88 p refs
(Contract N00024-79-C-6043)
(AD-A072567; ARL/PSU/TM-79-51) Avail: NTIS HC A05/MF A01 CSCL 13/10

Results from three studies relating to the development of a water jet propulsion system for a high speed planing craft are presented. More specifically, these studies apply to the development of the diffuser and pump inlet of the system and represent a continuation of previous work done at ARL/PSU in this area. The first study investigates the possible interaction of the flow between the diffuser and a vaned-volute type pump inlet. No interaction was revealed. The second study determined the feasibility of an improved vaned-volute type inlet using conventional pump design techniques to lay out the vanes. With the restrictions placed on the design by the propulsion system, flow separation from the vanes is likely and, thus, this type of inlet was found to be infeasible. The third study consisted of the design and model testing of a new diffuser and a conventional double suction pump inlet. The design and test results are documented in this report. Test results showed that the diffuser efficiency was improved slightly and the losses through the pump inlet were reduced by more than a factor of two from the losses in the vaned-volute inlet. GRA

A MODEL FOR NONLINEAR CREEP OF CONCRETE
J. H. Argyris, K. S. Pister, and K. J. William Apr. 1978 14 p refs Presented at 2d Session of RILEM Colloq. on Creep Concrete, Leeds, Engl., 20-21 Apr. 1978
(ISD-Rept-246) Avail: NTIS HC A02/MF A01

A constitutive model for uniaxial creep of concrete, based on thermodynamics of materials with internal state variables is described. Using experimental data, model parameters are estimated using least squares procedures. It is found that considerable nonlinearity with respect to stress exists in instantaneous creep response, that recoverable creep strain is relatively insensitive to aging, and that irreversible creep strain is relatively strongly affected by aging and stress level. A brief discussion of important open questions concerning choice of models for creep is included. Author (ESA)

DESORPTION HEAT CAPACITY OF 3He ADSORBED ON SOLID ARGON

Per Wennerstroem, Anders Toerne, and Torsten Lindqvist Mar. 1978 14 p refs
(UPTEC-78-16-R) Avail: NTIS HC A02/MF A01

The desorption heat capacity of successive monolayers of 3He absorbed on solid argon was measured and a rigid band model for the adsorption states was used in the analysis. Results show that the desorption energy for the first layer varies from -90 K to -38 K as a function of coverage. For the second layer the model shows that the first adatoms in this layer have thermodynamic properties very similar to the last atoms in the first layer. Author (ESA)

DIGITAL SOUND: SAMPLING-RATE SYNCHRONISATION BY VARIABLE DELAY
N. H. C. Gilchrist Sep. 1979 9 p refs
(BBC-RD-1979/17) Avail: British Broadcasting Corp., Kingswood Warren, Tadworth, Surrey, England

In a situation where a number of digital sound signals, all from sources operating at nominally the same sampling frequency, need to be processed, a variable delay technique may be used to synchronize the signals at the input to the processor. Experimental equipment is described which changes the sampling rate of a digital sound signal by using a variable delay which is automatically reset during program pauses. Listening tests indicate that the adjustment of sampling rates by a small amount using this technique can be achieved with little or no impairment to the sound signal. Author

PROSPECTS AND LIMITATIONS FOR USE OF FREQUENCY SPECTRUM FROM 40 TO 300 GHz
Clarence E. Catoe [1979] 11 p refs
(NASA-TM-80812) Avail: NTIS HC A02/MF A01 CSCL 17B

The existing and future use of the electromagnetic spectrum

from 40 to 300 gigahertz is discussed. The activities envisioned for this segment of the electromagnetic spectrum fall generically into two basic categories: communications and remote sensing. The communications services considered for this region are focused on the existing and future frequency allocations that are required for terrestrial radio services, space to ground radio services, space to space radio services, and space to deep space radio services. The remote sensing services considered for this region are divided into two groups of activities: earth viewing and space viewing. A.W.H.

VOICE DATA ENTRY IN AIR TRAFFIC CONTROL Report, May 1975 - Dec. 1978
Donald W. Connolly Aug. 1979 76 p refs
(FAA Proj. 219-151-100)
(AD-A073670; FAA-NA-79-20) Avail: NTIS
HC A05/MF A01 CSCL 17/2

The potential operational utility of state-of-the-art word recognition technology in air traffic control applications were studied. Experiment 1, employing 12 operators or talkers, secured baseline data representing the inherent best case recognition accuracy of the system. Three of the subvocabularies of an operational data entry language were tested exhaustively to a total of over 46,000 spoken words. On the average, across all speakers and all three subvocabularies, only 1 percent of the words spoken were erroneously recognized. Subsequent tuning of the recognition algorithm reduced the error rate to less than 0.4 percent. Experiment 2 compared the quality and efficiency of the voice system versus the existing keyboard method of entering complete operational messages. The voice system produced 64 percent fewer errors of all kinds than the keyboard in the messages entered, but showed no advantage (or disadvantage) in rate of entry. Voice entry, however, did demonstrate an advantage in the overall time consumed by the data entry process - less time was required to translate entry requirements into the spoken language than into the keyboard code. Other influential factors were also examined, including the effects of microphone type, individual differences between operators, the stability of operators' word-prints over time, and operator adaptation to the voice entry system. F.O.S.

EVALUATION OF TRANSPONDER ANTENNA COVERAGE/ATCRBS DURING SIMULATED FLIGHTS OF AIRCRAFT Final Report
Thomas Gibson Apr. 1979 73 p refs
(Contracts DOT-FA70WAI-175; F19628-78-C-0006)
(AD-A073547; ECAC-PR-76-019; FAA-RD-77-122) Avail: NTIS HC A04/MF A01 CSCL 17/9

A computer model was used to analyze the effect of aircraft orientation on the performance of the Air Traffic Control Radar Beacon System (ATCRBS). Flights by Cessna 150, Boeing 727, Boeing 747, and F-4H aircraft over a common flight route out of La Guardia Airport were simulated. Transponder/antenna performance for various aircraft attitudes and locations along the flight path was analyzed with respect to interrogators located at JFK airport. This performance was compared to a transponder having ideal, omni-directional antenna coverage to illustrate the degree to which the combination of aircraft orientation and transponder antenna pattern may affect ATCRBS performance. PROGRAM PSD: DIGITAL DETERMINATION OF POWER SPECTRAL DENSITIES OF RANDOM SIGNALS
J. T. D. Fritz Oct. 1978 52 p refs
(CSIR-ME-1594; ISBN-0-7988-1460-8) Avail: NTIS
HC A04/MF A01

The algorithm and procedure for the digital determination of power spectral densities from random signals are described. The program yields power spectra with a frequency range resolution of (1/256)f(MAX). Floating point arithmetic utilizing Varian supplied software is used with a consequent relatively long execution time of 210 seconds per analysis. This, however, is not a very serious drawback as the program was constructed to enable batch analyses to be carried out and can thus be run overnight. A significant improvement on execution time can be obtained by changing the program to fixed point double precision arithmetic. Should an even shorter execution time be desirable, the program must be rewritten to utilize the so-called Fast Fourier Transform algorithm. Author

CONCEPTS FOR 18/30 GHz SATELLITE COMMUNICATION SYSTEM STUDY. EXECUTIVE SUMMARY
M. Baker, R. Davies, L. Cuccia, and C. Mitchell 1 Nov. 1979
36 p 3 Vol.
(Contract NAS3-21362)
(NASA-CR-159680; WDL-TR8457) Avail: NTIS
HC A03/MF A01 CSCL 17B

An examination of a multiplicity of interconnected parameters ranging from specific technology details to total system economic costs for satellite communication systems at the 18/30 GHz transmission bands are presented. It was determined that K sub A band systems can incur a small communications outage during very heavy rainfall periods and that reducing the outage to zero would lead to prohibitive system costs. On the other hand, the economics of scale, ie, one spacecraft accommodating 2.5 GHz of bandwidth coupled with multiple beam frequency reuse, leads

to very low costs for those users who can tolerate the 5 to 50 hours per year of downtime. A multiple frequency band satellite network can provide the ultimate optimized match to the consumer performance/economics demands. M.M.M.

ANTENNA OF THE SPACE RADIOTELESCOPE KRT-3
V. I. Kostenko and L. I. Matveyenko Nov. 1979 22 p refs Transl. into ENGLISH of Antenna Kosmicheskogo Radioteleskopa KRT-3 (Moscow), PR-340, 1977 20 p Transl. by Kanner (Leo) Associates, Redwood City, Calif. Original doc. prepared by Academy of Sciences (USSR), Moscow
(Contract NASw-3199)
(NASA-TM-75714) Avail: NTIS HC A02/MF A01 CSCL 09C

The questions of antenna design with a diameter of 3 m for space radio-interferometry are examined. The basic characteristics of the antenna are determined, on the basis of which a model of the antenna of a space radiotelescope of 3.1 m KRT-3 is developed and prepared. The technological peculiarities of the antenna preparation are examined. The results of measurement of the reflecting surfaces of the telescope are cited, which point to the fact that the antenna may operate to wave lengths in the order of 2 mm. Author

RADAR DETECTION CALCULATIONS WITH THE HP-65 AND HP-67
M. A. Johnson May 1979 71 p refs
(AD-A071609; R79EMH5) Avail: NTIS HC A04/MF A01 CSCL 17/7

Card programmable calculators together with suitable programs can easily provide numerical answers which formerly took large computers and volumes of tabular or plotted outputs for everyday reference. Presented here are derivations and program listings for the HP-65 and HP-67 calculators to provide the user with commonly used radar detection performance data. Both fixed threshold and adaptive threshold CFAR detection with noncoherent integration are covered. Recursive programs for the general chi-squared target fluctuation distribution are treated as well as faster running recursive programs for the Swerling target Cases I - IV. Also included are fast programs for the required detection signal-to-noise ratio based on the simplified algorithms of Barton. GRA

AN EXPERIMENTAL INVESTIGATION OF THE REDUCTION OF NONLINEAR EFFECTS USING PASSIVE COMPENSATING NETWORKS Progress Report, Oct. 1977 - Sep. 1978
Carmen A. Paludi, Jr. and James J. Whalen Jun. 1979 63 p refs
(Contract F30602-75-C-0122; AF Proj. 2338)
(AD-A072422; RADC-TR-79-148) Avail: NTIS HC A04/MF A01 CSCL 20/14

This report describes an experimental investigation to determine if a procedure reported upon for reducing third order Intermodulation Products (IMP's) in an RF amplifier stage could be implemented in the laboratory. The third order IMP reduction procedure is based upon altering the RF amplifier linear out-of-band response by adding passive compensating networks. For this experiment, an RF amplifier tuned at 10 MHz was selected. The RF amplifier was excited by two CW signals at frequencies f1 = 9.0 MHz and f2 = 9.5 MHz in order to obtain a third order IMP at the frequency 2f2 - f1 = 10 MHz. The objective of the experiment was to determine if a significant reduction in this third order IMP could be obtained by connecting properly designed compensating networks to the basic RF amplifier stage. A linear model for the basic RF amplifier stage was developed. This model yielded calculated results that were in relatively good agreement with measured results for the magnitude and phase of the linear transfer function VOUT/VIN. Using the linear model for the basic amplifier stage, compensating networks were synthesized. GRA

HIGH EXPLOSIVE DETONATION AND ELECTROMAGNETIC INTERACTION Technical Report, Sep. 1977 - Jul. 1978
Edward T. Toton 30 Mar. 1979 35 p refs
(ZR0000101)
(AD-A072577; NSWC/WOL/TR-79-205) Avail: NTIS HC A03/MF A01 CSCL 19/4

The effect of stationary, uniform, electric, and magnetic fields on steady-state detonation of condensed explosives is studied. The electrical conductivity profile in the region of the reaction zone provides a current path and Joule heating. Expected increases of detonation velocity and pressure by Joule heating are computed using an Abel equation of state. It is shown that the detonation pressure of TNT can be increased by as much as 12% and detonation velocity by as much as 6% before electrical breakdown can occur. GRA

TEST PROCEDURE FOR C-BAND NONCOHERENT RADAR TRANSPONDER
1979 46 p
(AD-A072069; RSG-310-79) Avail: NTIS HC A03/MF A01 CSCL 17/9

The purpose of this document is to delineate types of tests and test procedures for radar transponder qualification, flight certification, and preflight readiness as required for support of test programs at the national ranges. The test procedures are general in type but are intended for standardization within the national ranges. Qualification or flight certification of a transponder by a national range does not necessarily mean that it is acceptable for all other ranges because each range has its own tracking and range safety responsibilities which, by their very nature, cannot be delegated. This document, however, outlines the test requirements and procedures for standardization at all national ranges. GRA

ON SURFACE-BASED ADVECTIVE RADAR DUCTS
Phillip J. Mulhearn. Dec. 1978. 29 p. refs.
(AD-A071454; RANRL-TN-5/78) Avail: NTIS HC A03/MF A01 CSCL 17/9

As a warm, well mixed air mass flows off a land surface and over a cooler sea, the air is modified in a layer near the surface. Within this layer humidity decreases while temperature increases with height and a radar duct is formed. The non-dimensional parameters governing the growth of the modified layer are derived and simple forms are found for the increase of layer height with fetch and for the shapes of humidity and temperature profiles. From these relations the depth and strength of the radar duct are derived as functions of the modified layer depth and the differences in potential temperature and water vapor pressure between the overland air mass and air in thermodynamic equilibrium with the sea surface. GRA

TECHNOLOGY ASSESSMENT FOR FUTURE MILSATCOM SYSTEMS: THE EHF BANDS
David J. Frediani. 12 Apr. 1979. 294 p. refs.
(Contract F19628-78-C-0002)
(AD-A071886; DCA-5; ESD-TR-79-43) Avail: NTIS HC A13/MF A01 CSCL 17/2

Severe crowding of the radio frequency spectrum and of the geostationary orbital arc, coupled with DoD requirements for increased bandwidth, motivate a transition of future MILSATCOM systems to operating frequencies between 20 and 50 GHz (EHF). The identification of potential users, the frequency selection process and the transitional architecture are the focus of DCA/MSO studies. This report, prepared in support of the DCA/MSO Frequency Selection Working Group, assesses the technology necessary to support MILSATCOM evolution to EHF. The technology assessment delineates the present, near term (3-5 years) and far term (6-10 years) availabilities of the major MILSATCOM subsystems. The major subsystems and systemic requirements are derived from strawman systems defined by the DCA/MSO Frequency Selection Working Group. The specific subsystems assessed include low-noise receivers, RF power amplifiers and antennas for the space and ground segments. The antenna gain limitations at EHF imposed by antenna surface accuracy and tracking accuracy are also addressed. As rain attenuation at EHF impacts system design and technology requirements, a global rain attenuation model is presented and the related issues of system availability, duration and impact of rain outages, and site diversity are assessed. Finally, recommendations are presented for technology development efforts and further studies necessary to support future EHF MILSATCOM deployment. GRA

ACCURACY VALIDATION OF THE MODIFIED NIKE HERCULES RADAR
Edward M. Darcy. May 1979. 77 p. refs.
(DA Proj. 1L1-62111-AH-71)
(AD-A071720; ERADCOM/ASL-TR-0031) Avail: NTIS HC A05/MF A01 CSCL 17/9

During the week of 7-11 February 1977, 12 balloon flights were made during which the balloon was tracked simultaneously by a modified Nike Hercules radar and a range radar. The range radars used were MPS-36s. The results of these tests and the statistical results of the machine differences are presented. Results show that the Nike Hercules is quite adequate for most mesoscale applications and is also adequate as a standard of comparison for such instruments that might be developed as a replacement for the Army's GMD. GRA

AN INVESTIGATION OF PORTABLE ELECTROMAGNETIC PULSE SIMULATORS/ALTERNATE SIMULATORS Final Report
M. I. Sancer, S. Siegel, and A. D. Varvatsis. Jun. 1979. 48 p.
(Contract F29601-77-C-0090)
(AD-A071342; AFWL-TR-78-200) Avail: NTIS HC A03/MF A01 CSCL 14/2

A theory is developed which defines the technical objectives for portable EMP simulator experiments and calculations. It is shown that under certain conditions, a configuration of portable sources need only excite a prescribed external interaction response on a class of systems. Under these conditions, the source configuration will excite the same electrical quantities within the system as would an EMP. Considerable attention is devoted to the demonstration that these conditions must include on accounting for the external environment to the system under test as well as the degree of electromagnetic rigidity of the portable sources. Finally, calculations that were chosen to address the plausibility of achieving the described external interaction objectives are presented and interpreted according to the required conditions. GRA

AN IMPROVED THEORY FOR MICROSTRIP ANTENNAS AND APPLICATION, PART 1 Interim Report
Y. T. Lo, W. F. Richards, and D. D. Harrison. May 1979. 33 p. refs.
(Contract F19628-78-C-0025; AF Proj. 2305)
(AD-A070791; UIEM-78-18-Pt-1; IR-1;
UILU-ENG-78-2563-Pt-1; RADC-TR-79-111-Pt-1) Avail: NTIS HC A03/MF A01 CSCL 09/5

An improvement to a recently reported theory for the analysis of the pattern and impedance loci of microstrip antennas is developed. It yields a theory which is simple and inexpensive to apply. The fields in the interior of the antennnas are characterized in terms of a discrete set of modes. The poles corresponding to these modes are complex and depend on the losses in the antenna. The representation of the fields in terms of these modes is rigorous only for a bona fide cavity with no copper loss. The proper shift in the complex poles due to the addition of copper and radiative losses is approximated by lumping the latter two together with the dielectric loss to form an effective loss tangent. By so doing, it is found that the resulting expressions for impedance of the microstrip antenna is in good agreement with measured results for all modes and feed locations. The theory is applied to the evaluation of impedance variation with feed location, multiport analysis, and to design of circularly polarized microstrip antennas. GRA

AN ANALYSIS OF THE DISK MICROSTRIP ANTENNA, PART 2 Interim Report
Y. T. Lo, D. D. Harrison, and W. F. Richards. Griffiss AFB, New York. RADC. May 1979. 98 p. refs.
(Contract F19682-78-C-0025)
(AD-A070794; UIEM-78-19-Pt-2; IR-2;
UILU-ENG-78-2564-Pt-2; RADC-TR-79-132-Pt-2) Avail: NTIS HC A05/MF A01 CSCL 09/5

Disk microstrip antennas are treated as cavities, from which both internal and external (radiation) field can be determined, based on an efficient improved theory. This theory can predict the impedance characteristics very accurately even for cases where the dominant mode is not strongly excited. The theory is extended to two-port disk microstrip antennas. In particular, if one port is shorted the input resonant impedance at another port on the circumference can be varied over orders of magnitude

by simply changing the relative angular positions between the two ports. In case of a single port a similar variation of input impedance can be achieved by moving the feed in the radial direction. All of these provide a means for impedance matching with practically no effect on the pattern. So far as the input impedance matching is concerned the antenna can be represented accurately by a parallel resonant circuit in series with an inductance. The former derives from the resonant mode term and the latter from all non-resonant terms of the field solution in expansion. Experiments have been conducted to verify the theoretical results. Excellent agreement is observed in all cases. GRA

PSEUDOSYMMETRIC EIGENMODE EXPANSION FOR THE MAGNETIC FIELD INTEGRAL EQUATION AND SEM CONSEQUENCES Final Report
Maurice I. Sancer, A. D. Varvatsis, and Scott Siegel. Jun. 1979. 57 p. refs.
(Contract F29601-78-C-0098)
(AD-A071429; AFWL-TR-78-172) Avail: NTIS
HC A04/MF A01 CSCL 20/3

An eigenmode expansion for the magnetic field integral equation (MFIE) is derived which eliminates the requirement that an adjoint solution be explicitly sought. Instead, an orthogonality relation is derived which only involves the eigenmodes of the original MFIE operator. To promote confidence in the validity of the resulting expansion, two analyses based on this expansion are presented which lead to known results. First, the expansion is applied to the problem of determining the surface current density induced on a perfectly conducting sphere by a plane wave and the known solution for this problem is duplicated by the expansion. The second analysis shows that for a general perfectly conducting body, the eigenmode expansion coefficient numerator evaluated at the purely imaginary frequency corresponding to an interior resonance is zero. This result is necessary in order to relate the eigenmode expansion to SEM. GRA

HC A04/MF A01 CSCL 20/3

Two separate but related efforts are described in this report. The first and more significant effort is a demonstration of the capability of the patch zoning method for numerically solving the magnetic field integral equation (MFIE). This is accomplished by comparing experimental data with numerical computations of the current density induced on metallic structures. The secondary effort is a derivation of the electric field integrodifferential equation (EFIDE) and the MFIE for electromagnetic pulse external interaction with perfectly conducting bodies above a finitely conducting half-space. The relationship between the two efforts is that the equations are represented in such a manner that the computational results, which are compared with experimental data, are readily seen to correspond to the numerical treatment of special cases of the MFIE finitely conducting ground equations. GRA

RADIO COMMUNICATION UTILIZING THE BASE OF A STRIATED BARIUM PLASMA
G. J. Fulks, L. D. Scott, D. H. Sowle, and W. R. Nortman. Jul. 1978. 43 p. refs.
(Contract DNA001-78-C-0237)
(AD-A072167; AD-E300465; MRC-R-401-R; DNA-4670T) Avail: NTIS HC A03/MF A01 CSCL 17/2

In conjunction with the DNA barium releases, Avefna I and II, an experiment was undertaken to determine if radio communication was possible off the base of a striated plasma created by these barium releases. A transmitting station was set up to broadcast a steady signal at two HF frequencies toward the base of the barium striations and two receiving stations listened for signal returns on the two frequencies. (The chosen geometry prevented reflections off the sides of the barium cloud from affecting the experiment). One station heard substantial returns while the other heard nothing. Data from the first station provide an estimate of the reflection cross sections for the base of the striated barium cloud. The negative result from the second station arises partly from limited sensitivity of equipment but the upper limit on cross section was less than that seen from the first station. This suggests a directional character for the signal reflected from the base of the cloud. GRA

HC A06/MF A01 CSCL 17/9

The Panel on the Extent of Radiation from the PAVE PAWS Radar System was charged to examine the extent of radiation and the exposure of the public to radiation from the PAVE PAWS system. In carrying out this task, the Panel has considered the characteristics of the PAVE PAWS radiation as related to public exposure and compared the possible exposure to existing ambient radiofrequency radiation on Cape Cod and in other locations in the United States. To provide perspective for the assessment of possible exposure effects the Panel has also, to the extent possible, reviewed and summarized the state of knowledge concerning the biologic effects of exposure to such radiation. The Panel did not address the question of the desirability or adequacy of the anticipated exposure control procedures, nor did it make a judgment concerning the relative safety or hazard of exposure to PAVE PAWS emissions. ENHANCEMENT AND BANDWIDTH COMPRESSION OF NOISY SPEECH
Jae S. Lim and Alan V. Oppenheim 26 Jun. 1979 99 p refs
(Contracts F19628-78-C-0002; N00014-75-C-0951; AF Proj. 7820)
(AD-A073139; TN-1979-51; ESD-TR-79-159) Avail: NTIS
HC A05/MF A01 CSCL 09/4

Over the past several years there has been considerable attention focussed on the problem of enhancement and bandwidth compression of speech degraded by additive background noise. This interest is motivated by several factors including a broad set of important applications, the apparent lack of robustness in current speech compression systems and the development of several potentially promising and practical solutions. One objective of this paper is to provide an overview of the variety of techniques that have been proposed for enhancement and bandwidth compression of speech degraded by additive background noise. A second objective is to suggest a unifying framework in terms of which the relationships between these systems is more visible and which hopefully will provide a structure which will suggest fruitful directions for further research. GRA

SPECTRAL ESTIMATES OF BAND-LIMITED SIGNALS Interim Report
William B. Gordon 2 Aug. 1979 22 p refs
(RR0210541)
(AD-A072776; NRL-8322) Avail: NTIS HC A02/MF A01 CSCL 09/4

We consider the problem of estimating the spectrum of a band-limited signal perturbed by additive white noise. Sharp bounds on the mean square errors of linear spectral estimates are computed and expressed as functions of time-bandwidth product sand signal-to-noise power ratios. When the data are sampled at the Nyquist rate, no linear spectral estimator can produce significantly more accurate results than the conventional discrete Fourier transform. In the more general case, consistent spectral estimators can be obtained only if both the data rate and the length of the observation window are increased without bound. GRA

HC A04/MF A01 CSCL 09/5

A study has been carried out to determine the feasibility of various antenna configurations for a proposed satellite mission to profile the surface temperature of the ocean using a passive microwave radiometer. Specifically, a static, multiple-beam microwave antenna utilizing a phase-switched Mills cross as its basic element is proposed and analyzed in detail. Although the Mills cross configuration does not completely meet the specified requirements of this particular application, its analysis does provide a necessary frame of reference for assessing its usefulness in general, and for establishing its features and drawbacks relative to alternative antenna configurations. It also serves as an illustrative example of some of the design tradeoffs and problems that are encountered in trying to map the earth's surface from a space platform. GRA

HC A04/MF A01 CSCL 17/2

This report describes the results of two studies designed to measure dynamic noise, photometrically, on a raster-scan display. One study evaluated spot microphotometry of a single raster line; the other evaluated microdensitometric power spectral analysis of close-up photographs of raster lines. The spot microphotometry technique proved superior and very reliable, yielding results that are highly correlated with input noise spectra. GRA

HEMISPHERICAL COVERAGE OF FOUR-FACED AIRCRAFT ARRAYS
Robert J. Mailloux and William G. Mavroides May 1979 19 p refs
(AF Proj. 4600)
(AD-A073079; RADC-TR-79-176) Avail: NTIS
HC A02/MF A01 CSCL 17/1

This report describes the radiating characteristics of a four-faced array with faces arranged in a streamlined configuration for hemispherical coverage. The report presents new experimental and theoretical results giving coverage for a side array in the plane perpendicular to the cylinder and shows that the structure radiates both polarizations efficiently for angles from the zenith to the horizon. In the absence of mutual coupling effects, the circularly polarized radiation remains within approximately 1 dB of the array projection factor. Finally, the report presents coverage contours for a four-faced array with the front and back faces half the size of the side faces. In this case, the proper choice of front array tilt angle can result in a hemispherical gain projection

factor within 3.5 dB of peak gain over nearly the whole hemisphere. GRA

SPACE-TIME SIGNAL PROCESSING OF RADAR RETURNS Technical Report, Dec. 1977 - Oct. 1978 on Phase 2
G. R. Cooper and C. D. McGillem Griffiss AFB, N.Y. RADC Jun. 1979 58 p refs
(Contract F30602-75-C-0082; AF Proj. 9567)
(AD-A072751; RADC-TR-79-156) Avail: NTIS HC A04/MF A01 CSCL 17/9

This work shows the presence of spatial symmetries which may allow a radar system to predict a frequency which will give a near maximum response as the target approaches the radar. If the target is complex then the target may be resolved into simpler components, which have desirable characteristics, and symmetries that may be exploited when tracking the target. An efficient method for the approximate evaluation of the time ambiguity functions for complex pulse envelope shapes has also been presented. GRA

LONG-TERM INSTABILITY PROBLEMS IN ADAPTIVE NOISE-CANCELERS
N. Ahmed (Kansas State Univ.), G. R. Elliot, and S. D. Stearns Aug. 1978 25 p refs
(Contract EY-76-C-04-0789)
(SAND-78-1032) Avail: NTIS HC A02/MF A01

The performance of the nonrecursive adaptive noise canceler (or predictor) is considered in terms of long term stability. The concept 'error-surface' is introduced and how a predictor can have a distributed error surface is described. Also, how its transfer function can wander from narrowband to broadband due to small perturbations at the input is discussed. Solutions to this instability problem are proposed. These include the MLMS algorithm and a perturbation scheme. Both solutions are shown to work successfully in a simple example and are implemented in a field usable microprocessor band filter. J.M.S.

PROPAGATION OF Lg WAVES ACROSS EASTERN EUROPE AND ASIA
A. J. Piwinskii and D. L. Springer 19 Jul. 1978 103 p refs
(Contract W-7405-eng-48)
(UCRL-52494) Avail: NTIS HC A06/MF A01

Data regrarding Lg propagation across Asia and eastern Europe is reported. The data from earthquakes located within the boundaries of the U.S.S.R. indicate that both short and long period Lg waves propagate efficiently across most of the Soviet Union land mass. The data from certain border regions, however, display erratic characteristics that may be due to propagation, source depth, or radiation pattern. These regions include paths across southern portions of the Black and Caspian Seas, the Caucasus Mountains, the Uzbek and Tadzhik Republics, the Sea of Okhotsk, and the northern seas (e.g., the Kara Sea). The only areas that appear to block Lg propagation completely are the central portions of the Sea of Japan and regions of the People's Republic of China. DOE

CONCEPT FOR A WORLDWIDE CIVIL MARITIME SATELLITE COMMUNICATION NETWORK (MARSAT). OPERATION SYSTEM STUDY Final Report
Oskar Bettinger, Heinz Cohrs, Johannes Conradt, Kurt Lindig, Rudolf Mosch, Eberhard Mueller, Gotteried Porst, Dieter Roth, and Kurt Taenzer Bonn Bundesmin. fuer Forsch. u. Technol. Dec. 1977 216 p refs In GERMAN; ENGLISH summary
(Contracts BMFT-WRT-1073; GfW-01-E-0724)
(BMFT-FB-W-77-13) Avail: NTIS HC A10/MF A01; ZLDI, Munich DM 45.15

A concept for a worlwide maritime satellite communication network that can fulfill the requirement of long-term demand and still allow further was worked out. At least three, maximally six geostationary satellites having linear transponders will each make full use of the exclusive MARSAT frequency. Best suited modulation methods and optimization procedures are discussed for normal and reduced requirements. Each satellite, its shore terminals, and the ships within its coverage area combine their functions to a single explored automatic local exchange. It is interfaced to existing telephone and telex networks. Procedures for optimum use of satellite channels are described. Central signaling channels are proposed for all call data, coordination, and remote control of channel selection on ships. The need for special distress call channels is justified. Author (ESA)

PARABOLIC ANTENNA FOR HOME RECEIVERS OF THE BROADCASTING SATELLITE SYSTEM Final Report
Ruediger Zeitz Bonn Bundesmin. fuer Forsch. u. Technol. Aug. 1978 32 p refs In GERMAN; ENGLISH summary
(Contracts BMFT-WRT-5007; DFVLR-BPT-01-YX-046)
(BMFT-FB-W-78-13) Avail: NTIS HC A03/MF A01; Fachinformationszentrum Energie, Phys., Math., Eggeinstein-Leopoldshafen, West Ger. DM 6.60

The planned broadcasting satellite system, operating within the 12 GHz band, requires small, inexpensive parabolic antennas. An antenna having high gain and small sidelobes was developed in order to show the feasibility of the mentioned system. In experiments, a parametric amplifier as well as a mixer were directly connected to the antenna. The antenna design enables the operator to direct the antenna towards the satellite (azimuth, elevation) and to parallel the polarization. It is shown that this simple design can be regarded as a prototype for an antenna to be mass produced. Author (ESA)

SOME METHODS FOR IDENTIFICATION OF LINEAR SYSTEMS WITH NOISY INPUT OUTPUT DATA
Torsten Soederstroem Sep. 1978 39 p refs
(UPTEC-78-73-R) Avail: NTIS HC A03/MF A01

Most identification methods rely on the assumption that the input is known exactly. However, when collecting data under an identification experiment it may not be possible to avoid noise in measuring the input signal. Some different ways to identify systems from noisy data are discussed. Sufficient conditions for identifiability are given. An approach which treats the measured input and output signals as outputs of a multivariable stochastic system is presented. If a prediction error method is applied using this approach the system will be identifiable under mild conditions. Such conditions are given. Author (ESA)

CONSIDERATIONS ON PROJECTS FOR HIGH CAPACITY AND LONG DISTANCE NUMERICAL DATA TRANSMISSION SYSTEMS [CONSIDERAZIONI INERENTI AL PROGETTO DI SISTEMI NUMERICI DI TRASMISSIONE A ELEVATA CAPACITA' E A GRANDE DISTANZA]
Odoardo Brugia, Benedetto Daino, Giancarlo DeMarchis, Domenico Deseta, Gabriele Falciasecca, Wolfango Maggi, Claudio Rossi, and William Wolfowicz Oct. 1977 14 p refs In ITALIAN Presented at 25th Intern. Congr. on Commun., Genoa, Oct. 1977
(FUB-50-1977) Avail: NTIS HC A02/MF A01

Some problems concerned with digital multiplexing of 140 Mbit/sec plesiochronous tributaries and transmission of the multiplexed signals over coaxial cables, optical fibers, or circular waveguides are investigated. Frame formats and frame alignment strategy characteristics are designed for three different systems having four, five, or six tributaries and operating at 560.488, 700.672, or 840.768 Mbit/sec, respectively. Orientative results are given for designing the repeater section of these systems for both the cases of coaxial cable and optical fiber transmission. Finally, the main characteristics of two waveguide systems operating at about 560 and 840 Mbit/sec are outlined on the basic of technical and economical considerations. Author (ESA)

THE RELATIONSHIP BETWEEN DISTORTION AND IMAGE QUALITY: SAMPLING PROCEDURES AND ACCURACY
Salvatore Miceli and Antonino Orlando Sep. 1977 7 p refs Presented at Intern. Symp. on Meas. in Telecommun., Lannion, France, Oct. 1977

(FUB-51-1977) Avail: NTIS HC A02/MF A01

The time variability in subjective assessments of image quality is considered as well as its effect on the evaluation of the mean opinion in double stratified samples of observers viewing still images. Attention is focused on a sampling procedure which avoids the factors that might introduce a bias in the function used in the least squares fit of experimental data. A method to evaluate the accuracy of the fitted function and to verify the validity of the additional law of impairments is also presented.

SELF-PHASE MODULATION AND TRANSMISSION IN OPTICAL FIBERS

Bruno Crosignani and Paolo DiPorto Dec. 1978 9 p refs

(FUB-23-1978) Avail: NTIS HC A02/MF A01

The self-modulation effects in fibers and the role of linear dispersion are described, pointing out that while self-phase modulation can significantly broaden the spectrum of a pulse propagating over a long fiber length, the same mechanism allows, under certain circumstances, the transmission of short pulses without distortion. The investigation of nonlinear propagation in a single-mode fiber, taking advantage of the formalism of couple-mode equations, is proposed in order to contribute to the study of the transmission of stable solitary pulses.

CHARACTERIZATION OF WAVE SCATTERING FROM RAINFALL, WITH PARTICULAR REFERENCE TO THE POSSIBLE INTERFERENCE IN EARTH-SATELLITE-EARTH LINKS AT FREQUENCIES ABOVE 10 GHz [CARATTERIZZAZIONE DELLA DIFFUSIONE DA IDROMETEORE CON PARTICOLARE RIGAURDO ALLE POSSIBILI INTERFERENZE TRA COLLEGAMENTI TERRESTRI E VIA SATELLITE A FREQUENCE SUPERIORI A 10 GHz]

Aldo Paraboni (Milan Polytec.) Nov. 1978 67 p refs In ITALIAN

(FUB-26-1978) Avail: NTIS HC A04/MF A01

Wave scattering due to rainfall is discussed in consideration of electromagnetic scattering from raindrops with rotational symmetry. It is shown that the Mie or Oguehi algorithms must be adapted to obtain a description that makes possible the integration of the effects of all the raindrops that constitute a dispersion. Then, the integration of dispersion scattering along with the characteristics of the resultant radiation. Scatter coupling and the evaluation of the received power and wave polarization are covered. Finally, details of application to the SIRIO-FUB station link are given, determining the insertion loss matrix and the polarization loss (1.45 dB for only one antenna oriented along the major axis of the polarization ellipse). RADIO COMMUNICATIONS AT EXTREMELY HIGH FREQUENCIES: THE USE OF METEOROLOGICAL DATA [RADIOCOMUNICAZIONI A FREQUENZE ELEVATISSME. UNA NOVA UTENZA DEI DATI IDROMETEOROLOGICI]

Francesco Barbaliscia, Francesco Fedi, and Bruno Peroni (Rome Univ.) Sep. 1978 17 p refs In ITALIAN Presented at CNR Convegno sull'Aggior delle Metodologie di Raccolta ed Elaborazione dei Dati Idrometeorol., Rome, Nov. 29-30, 1978

(FUB-27-1978) Avail: NTIS HC A02/MF A01

Extensive hydrometeorological measurements were conducted in relation to microwave propagation. The time distribution function of rain intensity in the microwave path was conducted. The relationship between attenuation and rain intensity was studied at 10, 11, and 30 GHz using 50 rain gages during several years and data were measured with high time-resolution. The systematic rain intensity data was recorded in selected spots. It is concluded that results obtained from available methods are in general acceptable, and that the integration time is an important measurement parameter. Counting the number of discharges of normal rain gages on a five minutes time-base and then extrapolating from distribution curves for smaller periods is recommended. Author (ESA)

PRECIPITATION AND MULTIPATH EFFECTS ON PROPAGATION PHENOMENA. SYSTEM CHARACTERISTICS AND TRANSMISSION QUALITY OF NUMERICAL RADIO LINKS WITH AND WITHOUT FREQUENCY REUSE [INFLUENZA DEI FENOMENI PROPAGATIVI DOVUTI A PRECIPITAZIONE E CAMMINI MULTIPLI, E DELLE CARATTERISTICHE DEL SISTEMA SULLA QUALITA' DI TRASMIZZIONE DI PONTI RADIO NUMERICI CON E SENZA RIUSO DI FREQUENZE]

Paolo Mandarini (Rome Univ.) Dec. 1978 65 p refs In ITALIAN

(FUB-29-1978) Avail: NTIS HC A04/MF A01

A general system description and a simulation program are presented. The system description includes channel models and design check-up for both the case where it is possible not to consider the effect of band selectivity due to echoes and where it is. The simulation program blocks description includes source simulation, codifiers, mathematical pulse sequence generators, modulators, channels, filters, and demodulators. Numerical results are given for a pure quaternary phase shift keying system, with rectangular base band pulses, six pole Butterworth emitting filters, and four pole Butterworth receiving filters. The margin reduction in the presence of an echo is calculated for the cases with and without reuse of frequency. It is concluded that the reuse of intersticial type channel frequencies is in general more convenient than use of channels at the same frequency (1.4 dB against 2.3 dB for non-selective propagation conditions). THE RHYMED WORDS METHOD OF MEASURING THE INTELLIGIBILITY INDEX IN AUDIOMETRIC WORK. THE INFLUENCE OF OPEN AND CLOSED VOWELS [METODO DELLE PAROLE RIMATE PER LA MISURA DELL'INDICE DI INTELLIGIBILATA' PER SCOPI AUDIOMETRICI. INFLUENZA DELLE VOCALI APERTE E CHIUSE]

Foster Bianchi Feb. 1979 11 p In ITALIAN

(FUB-1-1979) Avail: NTIS HC A02/MF A01

The influence of open and closed vowels (o and e) in the Italian language intelligibility rhyme tests was examined. The test material consisted of 15 lists of 25 four letter words grouped

in five sets with a difference in the initial consonant within each set. The magnetic recording of this phonetic material was carried out together with a second recording of a disturbance signal whose intensity could be independently controlled. The experimental design and the results are discussed, showing that no significant difference between intelligibility indexes are found between open and closed vowel words and that some of the lists present average indexes which are significantly different from the mean due to statistical coincidences of signal and masking noise, thus requiring a time-displacement of the masking noise recording for its use in future experiments. Author (ESA)

RADIO-WAVE PROPAGATION INVESTIGATIONS ON A DIGITAL RADIO LINK AT 2.2 GHz
Aake Blomquist, Folke Eklund, and Sture Wickerts Mar. 1979 64 p refs In SWEDISH; ENGLISH summary
(FOA-A-30020-E2) Avail: NTIS HC A04/MF A01

Propagation measurements comprising recordings of field strength, bit error rates, and spectral characteristics of fading were carried out on two paths 73 km and 49 km long respectively, in the same geographical area. The paths were running over rugged forested terrain in the middle of Sweden. A 34 Mbit/sec signal was transmitted using four phase shift keying. Conventional fading statistics were evaluated. Results show that the quality of the received digital data flow deteriorates at much smaller fading depths than expected at simple flat fading. The dominant reason for fading is radio wave reflection or refraction in horizontal layers in the lowest few hundred meters of the atmosphere where there are significant changes in the radio refractive index. A possible physical description of these fading events is presented. Author (ESA)

Static charges and agglomeration of particles in a fluidized bed system are minimized by maintaining in at least part of the bed a radio frequency glow discharge. This approach is eminently suitable for processes in which the conventional charge removing agents, i.e., moisture or conductive particle coatings, cannot be used. The technique is applied here to the disproportionation of calcium peroxide diperoxyhydrate to yield calcium superoxide, an exceptionally water and heat sensitive reaction. NASA

RECTANGULAR FLAT-PACK LIDS UNDER EXTERNAL PRESSURE IMPROVED FORMULAS FOR SCREENING AND DESIGN, REVISED Final Report
Charles Libove Jun. 1979 87 p refs
(Contract F30602-78-C-0083; AF Proj. 2306)
(AD-A072421; MAE-1233-T1; RADC-TR-79-138) Avail: NTIS HC A05/MF A01 CSCL 09/5

Earlier work is improved and extended to provide formulas for the maximum tensile stress in the lid-to-wall seal, the maximum lid deflection, and the lid collapsing pressure for a rectangular flat-pack under external pressure. It is shown how these formulas can facilitate (a) the proper design of the package so that it will retain its hermeticity and serviceability under a given screening pressure and (b) the selection of a proper pressure to use in the hermeticity screening of an already designed package. Information is also given on the approximate equivalence of external pressure and centrifuge acceleration in regard to the seal stresses and lid behavior. Finally, experimental data on package hermeticity are presented which tend to confirm the validity of the main hypotheses of the present work. Author (GRA)

I/J BAND LOW-COST CROSSED-FIELD AMPLIFIER Final Technical Report, 28 Mar. 1977 - 31 Mar. 1979
Robert R. Moats Jun. 1979 54 p refs
(Contract DAAB07-77-C-2642)
(AD-A072311; Rept-094-008972; DELET-TR-77-2642-F) Avail: NTIS HC A04/MF A01 CSCL 09/1

This program is directed toward development of an I/J band, linear format, injected-beam crossed-field amplifier (IBCFA) for electronic warfare. The IBCFA should be capable of power output of 1000 W peak, 200 W average, between 8.5 and 17 GHz with 20 dB gain. A laser-cut shaped-substrate meander line is used. Performance in an E/F band IBCFA was evaluated, for which the objective performance in the 2-4GHz band is 3.0 kW peak power output, 1.0 kW average power output, also with 20 dB gain. In addition, a gun for I/J band was designed. The technology for constructing meander circuits on laser-cut shaped substrates bonded to co-expansive ground planes has been established. Operating CFA's have been built and tested in E/F-band, and cold test meander circuits have been built in I/J-band. The first E/F-band operating CFA using the shaped-substrate meander line, and other parts common with a standard E/F-band CFA design, was built and tested. Performance was comparable with a typical CFA of standard design, slightly lower in efficiency at mid band and approximately the same over the remaining part of the 2-4 GHz band. The second E/F band operating model was limited in peak power, apparently from RF arcs for reasons not yet determined. GRA

ELECTRIC AND MAGNETIC FIELDS OF AN INTENSE PULSE OF RELATIVISTIC ELECTRONS PROPAGATING THROUGH AIR Final Report
Kenneth A. Dreyer 1979 206 p refs
(AD-A071621; AFIT/DS/PH/79-1) Avail: NTIS HC A10/MF A01 CSCL 20/3

Since propagation characteristics of an electron beam traversing a neutral gas are determined by the response of the beam electrons to their self-fields, an accurate evaluation of the electric and magnetic (EM) fields is essential to any propagation analysis. We report here on theoretical models that were developed for the electromagnetic fields associated with an electron beam propagating in air. One- and two-dimensional models of the fields, and a model for the electron avalanche of the air, were solved on a computer. The major conclusions from calculational results are: the ionization model adequately describes the ionization process over a pressure range of from five Torr to 760 Torr; ionization l&g from the high energy secondary electrons is unimportant; in many cases, the one-dimensional model was found to be as good as the two-dimensional model; and the net current saturates near 15 kilo-Amperes at sea-level pressure, and saturates at lower values at lower air pressure. CERAMIC PIEZOELECTRIC TRANSDUCERS Final Report, 1 Jan. - 31 Dec. 1978
L. E. Cross, J. V. Biggers, and R. E. Newnham 1 Jun. 1979 247 p refs
(Contract N00014-76-C-0515; DARPA Order 3203)
(AD-A071652) Avail: NTIS HC A11/MF A01 CSCL 20/2

The work described in this report was carried out in the Materials Research Laboratory of The Pennsylvania State University over the period January 1, 1978 to December 31, 1978. The period is the final year of a joint DARPA/ONR sponsored three-year contract effort directed towards the development of new and improved piezoceramic materials for electromechanical transducers. A major success of the program has been the development of new composite transducers with unusually high piezoelectric g(h) coefficients. A second important advance has been the development of a new family of electrostrictive materials based on the ferroelectric relaxor Pb3MgNb2O9 (PMN). Sophisticated computer aided graphics techniques have been used to develop a phenomenological Gibbs function for the PZT solid solution family. In support of these major efforts, a considerable amount of detailed work has been done to develop the processing capabilities required to assemble the many different ceramics and composites which have been the topics of study. A small additional effort was committed to the growth of single crystals and of oriented polycrystals of the ferroelectric antimony sulphur iodide. GRA

OPTICAL POWER SPECTRUM ANALYSIS OF PROCESSED IMAGERY Final Report, 10 Jan. 1978 - 30 Jun. 1979
Richard A. Schindler Jul. 1979 80 p refs
(Contract F33615-78-C-0503; AF Proj. 2313)
(AD-A073083; AMRL-TR-79-29) Avail: NTIS HC A05/MF A01 CSCL 09/4

This report describes the approach, procedures and results of a study to examine the use of information density values based on image power spectra as tools in the selection and application of digital image processing techniques. Information density measures are determined for unprocessed and processed imagery and compared with observer target recognition performance. The report describes modifications to the information density measure to improve the relationship with performance and to select the most effective processing technique. GRA

THE EQUIVALENT CIRCUIT IN THE MOBILITY ANALOGY OF A MAGNETOSTRICTIVE TRANSDUCER IN THE PRESENCE OF EDDY CURRENTS Interim Report
Steven W. Meeks 26 Mar. 1979 42 p refs
(RR0110842)
(AD-A072879; AD-E000305; NRL-8294) Avail: NTIS HC A03/MF A01 CSCL 09/1

Recent research into the highly magnetostrictive rare earth iron compounds has renewed an interest in magnetostrictive transducers. A typical magnetostrictive transducer is designed with the aid of an equivalent circuit which electrically represents the differential equations that govern the motion of the transducer. The equivalent circuit is used to predict the transmitting responses, receiving response, electrical impedance, and efficiency of the transducer. Ohmic losses generated by eddy currents in metallic magnetostrictive transducers reduce the efficiency and alter the electrical impedance. Thus an equivalent circuit is required which can predict the effect of eddy currents on the efficiency, the electrical impedance, the transmitting responses, and the receiving response of a magnetostrictive transducer. The report presents the derivation of an equivalent circuit of a magnetostrictive transducer in the presence of eddy currents using an exact eddy-current theory. However, use of the exact theory can be time consuming. Lumped equivalent circuits are also presented which use approximations to the exact theory to simply and accurately predict the efficiency and electrical impedance of a transducer with eddy currents within a frequency range of practical interest near the clamped characteristic frequency. NON-NOBLE COLLOIDAL CATALYSTS Final Report, 15 May 1977 - 15 Sep. 1978
Nathan Feldstein May 1979 39 p refs
(Contract F33615-77-C-5106)
(AD-A072757; AFML-TR-78-203) Avail: NTIS HC A03/MF A01 CSCL 09/5

This investigation is concerned with the development of non-noble metal autocatalytic colloids suitable for initiating electroless copper plating of printed wiring boards (PWB's). Additionally, the processing materials and parameters are selected and adjusted so that costs are reduced and the reliability of the PWB's are increased. This is achieved by the elimination of 'precious metals' as catalysts and the maintenance of near-normal pH levels (approx. 5-10) throughout the process thereby minimizing acidic residues on the PWB's. LOW-LOSS CHARGE-COUPLED DEVICE Final Technical Report, 15 May 1977 - 15 Nov. 1978
W. J. Kosonocky, D. J. Sauer, C. Y. Tayag, and F. V. Shallcross Griffiss AFB, N. Y. RADC Jun. 1979 101 p refs
(Contract F19628-77-C-0176; AF Proj. 2305)
(AD-A072989; PRRL-78-CR-57; RADC-TR-79-144) Avail: NTIS HC A06/MF A01 CSCL 09/5

Two closed-loop CCD structures, a 256-stage and a 1024-stage devices were designed, fabricated, and operated to demonstrate a low-loss mode of operation for a very long CCD delay line or a closed-loop CCD structure. The low-loss CCD concept consists of operating a CCD with each signal charge well followed by one or more trailing-bias-charge wells. Two orders of magnitude improvement in the effective transfer losses were demonstrated experimentally by periodically recombining at a signal-regeneration stage the (first-order) signal-charge transfer losses collected by the trailing bias charger with the corresponding signal-charge packets. An effective transfer loss of 2.4 x 10 to the -7th power per transfer was demonstrated. The maximum time delay has also been improved by two orders of magnitude over that of conventional CCDs by means of a new dark-current subtraction technique. The 1024 stage closed-loop low-loss CCD was also operated as a synchronous signal correlator producting an improvement in the signal-to-noise ratio of 17.5 dB as a result of 100 signal recirculations in the loop. A LOOP FOR TRACKING THE FREQUENCY OF A PULSED SINUSOID Interim Report
R. J. Huff and D. W. Herr Griffiss AFB, N. Y. RADC Jul. 1979 61 p refs
(Contract F30602-75-C-0061; AF Proj. 6523)
(AD-A072750; ESL-710300-4; RADC-TR-79-171) Avail: NTIS HC A04/MF A01 CSCL 09/3

The configuration and performance of a hybrid frequency tracking loop which tracks the frequency of a pulsed sinusoid are addressed in this report. A linear model of the loop is developed and an approximate expression is derived for the standard deviation of the frequency tracking error due to the presence of additive white Gaussian noise at the loop's input. Results obtained by simulating the loop on a digital computer are presented which show the extent to which loop non-linearities affect the standard deviation of the frequency tracking error, the distribution of the frequency tracking error, and the loop lock range. These results show that the loop operates with a high degree of effectiveness. GRA

DELETERIOUS EFFECT OF FUSING FLUIDS ON PRINTED WIRING BOARDS Report, 1 Dec. 1978 - 30 Apr. 1979
David O. Pond 9 May 1979 59 p
(AD-AC72716; NAC-TR-2259) Avail: NTIS HC A04/MF A01 CSCL 09/5

This study identified the corrosive effects of fusing fluids and fusing fluid residues on printed wiring boards subjected to electrical stress in a humid environment at elevated temperature. The effect of varying delay times between solder fusing and cleaning of fusing fluid residues for three fusing fluids was studied. The effect of a single delay time between solder fusing and cleaning of fusing fluid residues for eight other fusing fluids was studied. Also, the protective value of a solder resist and a conformal coating was evaluated. GRA

FEASIBILITY DEMONSTRATION OF A HIGH POWER WIDEBAND TWT WITH LOW AM/PM DISTORTION Final Report
E. G. Chaffee 26 Feb. 1979 54 p refs
(Contract N00173-77-C-0214)
(AD-A072932) Avail: NTIS HC A04/MF A01 CSCL 09/1

Loss-line stabilized tubes have been under development at Litton Industries under the supervision of the Naval Research Laboratories since 1973. Early developmental tubes demonstrated high power, wide bandwidth and efficient operation. In-band distributed loss techniques were developed to form attenuator sections to provide lower bandedge stability and to allow efficient operation at the high frequency bandedge. Stabilization problems, however, at the upper bandedge prevented operation at full design perveance. In the last tube preceding this contract, upper bandedge stability techniques were improved significantly; but, the tube exhibited in-band regenerative oscillations which prevented direct demonstration of this stability improvement. The two tubes built under this contract both demonstrated oscillation stability at design perveance and fully demonstrated the potential of loss line stabilized tubes. The design changes and the demonstration of these two tubes are discussed in this report. GRA

PRODUCTION ENGINEERING MEASURE (PEM) MANUFACTURING METHODS AND TECHNOLOGY FOR PIEZOELECTRIC TRANSFORMERS Final Report, 14 Jul. 1975 - 14 Dec. 1978
William B. Harrison 15 May 1979 192 p refs
(Contract DAAB07-76-C-0008)
(AD-A072674; HONEYWELL-47514) Avail: NTIS HC A09/MF A01 CSCL 09/1

This is the final report on Contract DAAB07-76-C-0008, which established a cost-effective production capability for manufacturing piezoelectric ceramic transformers to be used in operating 18mm night vision image intensifier tubes. The 18 mm PET production approach established by this program produced acceptable units which met all of the specifications established for this high voltage step-up transformer. A one-element packaged PET was established in place of the original two-element developmental units. This was accomplished by establishing more realistic resistive and capacitive load requirements for each of the V12 and V3 voltage outputs. All of the equipment and tooling designed and built produced satisfactory pilot production run units. The cost objectives were achieved on the individual piezoelectric elements. Higher costs were associated with attaching leads to the PET ceramic elements and packaging was more time-consuming than desired. GRA

DEVELOPMENT OF A 3 MV PULSE TRANSFORMER
G. J. Rohwein May 1979 22 p refs
(Contract EY-76-C-04-0789)
(SAND-79-0813) Avail: NTIS HC A02/MF A01

A 3 MV transformer designed for charging high voltage pulse forming transmission lines is described. The transformer is an air core spiral strip design which incorporates ring cage shielding to control edge breakdown in the secondary winding. The physical features of the transformer are described along with its electrical characteristics and the operational results. Air core transformers are an attractive alternative to Marx generators for charging high voltage pulse forming transmission lines (PFL) such as those used with high power electron or ion beam accelerators. Some of the advantages of transformer systems include simplicity, compactness, high reliability, reasonable cost and high energy transfer efficiency. The transformer was designed to

demonstrate these features. The primary objective, however, was to establish the feasibility of multimegavolt operation. DOE

MAGNETIC ANOMALY IN SUPERCONDUCTING TmRh4B4
J. L. Smith, C. Y. Huang, J. J. Tsou (Wichita State Univ.), and J. C. Ho (Wichita State Univ.). 1978. 10 p. refs. Presented at the 24th Annual Conf. on Magnetism and Magnetic Materials, Cleveland, 14-17 Nov. 1978.
(Contract W-7405-eng-36)
(LA-UR-78-2701; Conf-781114-4) Avail: NTIS HC A02/MF A01

The magnetic and superconducting properties of TmRh4B4 (which becomes superconducting at 9.6 K) were investigated by means of ac and dc magnetic susceptibility and specific heat measurements. At 10.7 K, an ac susceptibility peak similar to those found in spin glasses was observed. In addition, a pronounced specific heat peak was observed at 11.4 K. The susceptibility peak is essentially unaffected by substitution of 1% Lu or Er for the Tm, but it diminishes when much larger amounts of Er are substituted. The physical origin of this anomalous peak is discussed. DOE

SOME dc SUPERCONDUCTING CABLES
William E. Keller. 1979. 27 p. refs. Presented at the 1979 Workshop on Public Policy Aspects of High Capacity Electric Power Transmissions, Aspen, Colo., 14-16 May 1979.
(Contract W-7405-eng-26)
(LA-UR-79-1057; Conf-790527-1) Avail: NTIS HC A03/MF A01

The general characteristics of dc superconducting cables as well as details of two specific designs, one coaxial and the other double monopolar, are discussed. The special advantages of these cables lie in the relative simplicity of construction, their extremely high operating efficiency, and their compactness when compared with other ac or dc high-capacity cables cooled by flowing fluids, either at ambient or cryogenic temperatures. These features are discussed in the context of economic, environmental, and power system considerations, including some of the possible trade-offs among conventional and superconducting ac and dc systems. DOE

PRELIMINARY DIELECTRIC STUDIES. SPIR-O-LINE CABLE FOR APPLICATION AT POWER FREQUENCIES. Final Report
John S. Engelhardt. 4 Dec. 1978. 55 p. refs.
(Contract EG-77-C-01-5054)
(HCP/T5054-01) Avail: NTIS HC A04/MF A01

A unique dielectric system for both flexible and rigid power cable applications was studied. The Spir-O-line is a high powered radio frequency transmission system. The cable consists of a central conductor continuously supported by six high density polyethylene tubes inside a metal sheath, which operates as a gas insulated transmission line with either nitrogen or SF6 as the filling medium. A rough analysis of the dielectric geometry concluded that its breakdown strength might be improved over that of the open coaxial conductor configurations. A series of breakdown tests was performed on the smaller range of commercially available sizes. The results confirmed the expected behavior patterns, but did not fully explore the upper units of performance due to occasional tube separations in the samples tested. The potential voltage ratings of the larger available sizes were estimated. There is considerable flexibility in the design of the conductor due to the continuous support of the dielectric tubes. DOE

WILL AN INCREASING NUMBER OF COMPANIES START MAKING THEIR OWN LSI-COMPONENTS? AN EVALUATION OF DEVELOPMENT TRENDS IN THE ELECTRONICS INDUSTRY [EGEN PRODUKTION AF LSI-KOMPONENTER? EN VURDERING AF, OM UDVIKLINGEN I ELEKTRONIKINDUSTRIEN VIL MEDFOERE AT STADIGT FLERE VIRKSOMHEDER ETABLERER EGEN PRODUKTION AF LSI-KOMPONENTER]
Soeren Larsen Jun. 1978 34 p refs Partly in DANISH and ENGLISH
(ECR-82) Avail: NTIS HC A03/MF A01

Low sales volume custommade LSI market trends are examined in order to assess the market development potential for Danish companies specialized in this field. Activities of the large electric materials and electronics producers in the U.S.A. and Europe, their production programs, the financial relationship between electronic activities and LSI production, the actual extent of home-used LSI, and development trends are reviewed. It is concluded that there are few indications pointing to an increase in low sales volume custom LSI components use. On the contrary microprocessors and other commercially available LSI components can be adapted to still more applications than before so that the need for custom made LSI will diminish. Author (ESA)

DIGITAL CALCULATION OF THE COMMUTATION CHARACTERISTICS OF ARMATURE WINDINGS
Franz Maier London Dec. 1978 58 p refs Transl. into ENGLISH from Sci. Elec., v. 19, 1973 p 97-133
(DRIC-Trans-5359; BR67219) Avail: NTIS HC A04/MF A01

The process of commutation and the role of the mechanical commutator in both electric motors and generators are discussed. The principles of modern commutation theory are reviewed and equations are derived for the commutation characteristics of armature windings. Theoretical considerations include current commutation curves and fields, independent and dependent commutation, rectilinear and medially rectilinear commutation as well as general descriptions of electromagnetic fields and their interactions. Characteristic values for the commutation properties of a winding are particularly emphasized. Commutation inductances and their calculation are covered. Various winding configurations and their associated circuit elements are modeled mathematically. Finally, calculation results are applied to specific examples of commutation behavior. Author (ESA)

ANALYSIS AND DESIGN OF A PHASE LINEARIZATION SYSTEM FOR TRAVELING WAVE TUBE AMPLIFIERS [ETUDE ET REALISATION D'UN LINEARISEUR DE PHASE POUR L'AMPLIFICATEUR A TUBE A ONDE PROGRESSIVE]
Jean-Pierre Pochon Nov. 1977 216 p refs In FRENCH; ENGLISH summary
(CNES-NT-86) Avail: NTIS HC A10/MF A01

A concise theory of the operation of traveling wave tube amplifiers TWTA is presented. The tradeoff between efficiency and nonlinearity is emphasized. Distortion in transmission of a television signal caused by nonlinearities, such as AM/PM conversion, in the TWTA of a communication channel is discussed. The performance measurement of an X-band TWTA for satellite communication and the measurement of related nonlinearity is outlined. The analysis and design of a phase linearization system which considerably reduces the AM/PM conversion coeffficient and so allows the TWTA to be operated at saturated power are shown. The study was conducted in the 11 GHz frequency band and applications to satellite television transmission are cited. Author (ESA)

ON THE USE OF A SEMI-AUTOMATED TEST SYSTEM FOR MEASURING THE CHARACTERISTICS AND/OR THE 'S' PARAMETERS OF A QUADRUPOLAR NETWORK [UTILISATION D'UN SYSTEME DE TEST SEMI-AUTOMATIQUE POUR LA MESURE DES CARACTERISTIQUES ET/OU DES PARAMETRES 'S' D'UN QUADRIPOLE]

Jean-Luc Sedard Nov. 1978 78 p In FRENCH; ENGLISH summary
(CNES-NT-87) Avail: NTIS HC A05/MF A01

The implementation and use of a semi-automated test system based on a Hewlett-Packard computer, type HP 9825 A, and its associated peripherals is described. The system includes a series of programs which allow the measurement of the chief characteristics of a four terminal network (quadripolar) versus input power (linearity, phase, etc.) at a constant frequency, or versus frequency (gain, bandwidth, phase, transit time, etc.) for a given input power. This allows microwave equipment performance to be checked and determined rapidly. A second series of programs was studied to obtain the S parameters characteristic of a four terminal network. It automatically calibrates the equipment and calculates, from the measurements, the real parameters, allowing for errors introduced either by the equipment of by the measurement principle. ON THE MAGNETIZING ENERGY BALANCE IN ELECTRIC NETWORKS, PARTICULARLY REGARDING NETWORKS INVOLVING MACHINES WITH COMMUTATORS [SUL BILANCIO DELL'ENERGIA MAGNETIZZANTE NELLE RETI ELETTRICHE, CON PARTICOLARE RIGUARDO ALLE RETI COMPRENDENTI MACCHINE A COMMUTAZIONE]
R. Bini and L. Taponecco 1978 11 p refs
(Rept-1630) Avail: NTIS HC A02/MF A01

The magnetizing energy balance for various types of electric networks involving machines with commutators of electronic switching devices is considered. It is assumed that the networks are nonsinusoidal in operation. Three different networks are analyzed. These are a network with a permanent magnet which is immobile, a network containing a permanent magnet which is in relative motion, and a network whose circuit is subjected to the periodic interruption and reinsertion of a magnetic field. The characteristics of the energy balance are discussed for each case. In order to establish the validity of theoretical assumptions a test circuit was built and its characteristics measured. Results show acceptable agreement. Author (ESA)

A METHOD FOR TEMPERATURE STABILIZATION OF CURRENT GENERATORS AND ZENERDIODES
Tommy Oeberg Oct. 1978 18 p ref
(UPTEC-78-76-R) Avail: NTIS HC A02/MF A01

An inexpensive method for temperature stabilization of zener diodes and current generators is presented. The method makes it possible to compute the temperature dependence of the current in a simple one transistor current generator. The temperature drift can be utilized to balance the temperature variation of the voltage over a zener diode. The method is based on differentiation of the expression for the output current generator. A formula for the calculations is presented which makes the method easy to use. Good results were obtained. Minor changes in the calculations make it possible to compute the dependence on variation in other parameters, such as in the supply voltage. Author (ESA)

MULTIHOLE COUPLERS BETWEEN DIFFERENT WAVEGUIDES. THEORY AND EXPERIMENTS
Franco Bertolani and Gabriele Falciasecca (Bologna Univ.) Aug. 1978 6 p refs Presented at 6th Colloq. on Microwave Commun., Budapest, Aug. 1978
(FUB-30-1978) Avail: NTIS HC A02/MF A01

A procedure to obtain, with the required approximation, the phase shift in multihole couplers between equal or different waveguides is presented in order to avoid the problem of experimental adjustment when a strong coupling is wanted. The experimental results show good agreement with theory. This design method was extensively used to produce couplers between the TE1C of rectangular waveguides and the more important modes of circular waveguides (TE01, TE02, TE11, TE12, TM11). In the described example for a coupler with the TE01 mode a 0.5 dB coupling was obtained at the design frequency (30 to 38 GHz band). Author (ESA)

UNCONVENTIONAL CIRCUITS FOR STATIC VOLTAGE TRANSFORMERS Final Report
Johannes Nestler, Guenther Junge, Ingeborg Tzivelekas, and Hans Wrede Bonn Bundesmin. fuer Forsch. u. Technol. Dec. 1978 269 p refs In GERMAN; ENGLISH summary Sponsored by Bundesmin. fuer Forsch. u. Technol.
(BMFT-FB-T-78-26) Avail: NTIS HC A12/MF A01; Fachinformationszentrum Energie, Phys., Math., Eggenstein-Leopoldshafen, West Ger. DM 56,90

The design and development of circuits for static converters are reported on. These include primarily thyristor/transistor circuits as well as a circuit for load-controlled converters. In thyristor/transistor circuits transistors are used for quenching and commutation purposes as well as to protect thyristors. With these circuits the rated current can be commuted down to very low imput voltages. The load-controlled converter by virtue of this method of commutation is characterized by simple design and by the fact that it displays high efficiency at high clock frequencies. Two load-controlled converters were constructed, one of which provided a power of 20 kW at a clock frequency of 7 kHz, the efficiency achieved being 90%. Modular systems were developed for voltage converters. In this connection the possible application of heat pipes was examined for such converters with respect to the dependence on mounting position and the start-up and peak load behavior. Author (ESA)

A SIMPLE PULSE PEAK DETECTOR
G. A. Wilkinson London Sep. 1977 16 p refs
(RAE-TM-DW-10; BR60614) Avail: NTIS HC A02/MF A01

A simple peak detector was built to act as an analog monitor of the height of a video pulse train such as might be received from a pulsed microwave transmitter. The performance of the circuit as a function of pulse width and pulse repetition frequency (PRF) was investigated. The detector is shown to be usable for pulse widths greater than 1 micro sec and PRF's greater than about 50 Hz. Author (ESA)

A COMPARATIVE 5000 HOURS LIFE TEST OF LIGHT EMITTING DIODE DISPLAYS, INCLUDING 22 VARIANTS FROM 10 MANUFACTURERS
H. J. Nordby Mar. 1979 48 p Sponsored by Dan. Council of Technol. and Soc. for Reliability and Environ. Testing (SPM) Original contains color illustrations
(ECR-86) Avail: NTIS HC A03/MF A01

Each type of display was represented in 4 groups. The 4 groups were exposed in different environments with different load conditions. None of the displays were overloaded with respect to the manufacturers specifications. During the 5000 hours life test the total 7 segment luminous intensity from each display was measured and recorded. In this way is is possible to produce degradation curves for each variant. The intensity of all segments in one group was recorded to determine the nonuniformity for each display. The results show that only a few variants display

remarkable degradation. Temperature cycling and intermittent operation are the only exposures that produce catastrophic failures. The nonuniformity is found to be a serious drawback for a number of the investigated devices. Author (ESA)

FLOW BEHIND CURVED SHOCK WAVES
S. Molder Sep. 1979 43 p refs
(Grant AF-AFOSR-3303-77)
(UTIAS-217; ISSN-0082-5255) Avail: NTIS HC A03/MF A01

Equations are presented for the gradients of pressure, density and velocity behind curved shock waves in a uniform upstream flow. Formulas are given for the inclination of constant property lines behind two dimensional, conical and doubly curved shocks. Graphical results are presented for lambda = 1.4 and a free stream Mach number of 3.0. An equation is derived which relates the inclination of the isobars, isopycnics and isotachs. A general relationship is derived for doubly curved shocks which connects the two shock curvatures and the streamline curvature just behind the shock wave. Curved shock theory is applied to the calculation of flow curvature and pressure gradients in the vicinity of a normal shock as well as to finding the orientation of the sonic line behind a curved oblique shock in uniform flow. EFFECTS OF PRECURSOR HEATING ON RADIATIVE AND CHEMICALLY REACTING VISCOUS FLOW AROUND A JOVIAN ENTRY BODY Final Report, 1 Feb. 1978 - 31 Mar. 1979
S. N. Tiwari and K. Y. Szema Washington NASA Oct. 1979 183 p refs
(Grant NsG-1492)
(NASA-CR-3186) Avail: NTIS HC A09/MF A01 CSCL 20D

The influence of change in the precursor region flow properties on the entire shock layer flow phenomena around a Jovian entry body was investigated. The flow in the shock layer was assumed to be steady, axisymmetric, and viscous. Both the chemical equilibrium and the nonequilibrium composition of the shock layer gas were considered. The effects of transitional range behavior were included in the analysis of high altitude entry conditions. Realistic thermophysical and radiation models were used, and results were obtained by employing the implicit finite difference technique in the shock layer and an iterative procedure for the entire shock layer precursor zone. Results obtained for a 45 degree angle hyperboloid blunt body entering Jupiter's atmosphere at zero angle of attack indicates that preheating the gas significantly increases the static pressure and temperature ahead of the shock for entry velocities exceeding 36 km/sec. The nonequilibrium radiative heating rate to the body is found to be significantly higher than the corresponding equilibrium heating. The precursor heating generally increases the radiative and convective heating of a body. That increase is slightly higher for the nonequilibrium conditions. R.C.T.

STREAKLINE FLOW VISUALIZATION STUDY OF A HORSESHOE VORTEX IN A LARGE-SCALE, TWO-DIMENSIONAL TURBINE STATOR CASCADE
Raymond E. Gaugler and Louis M. Russell 1979 20 p refs Proposed for presentation at 25th Intern. Gas Turbine Conf. and Products Show, New Orleans, La., 9-13 Mar. 1980; sponsored by ASME
(NASA-TM-79274; E-201) Avail: NTIS HC A02/MF A01 CSCL 20D

Neutrally bouyant helium-filled bubbles were observed as they followed the streamlines in a horseshoe vortex system around the vane leading edge in a large scale, two dimensional, turbine stator cascade. Inlet Reynolds number, based on true chord, ranged between 100,000 to 300,000. Bubbles were introduced into the endwall boundary layer through a slot upstream of the vane leading edge. The paths of the bubbles were recorded photographically as streaklines on 16 mm movie film. Individual frames from the film were selected, and overlayed to show the details of the horseshoe vortex around the leading edge. The transport of the vortex across the passage near the leading edge is clearly seen when compared to the streaks formed by bubbles carried in the main stream. Limiting streamlines on the endwall surface were traced by the flow of oil drops. Author

RADIATIVE AND FREE CONVECTIVE HEAT TRANSFER FROM A CONTAINERLESS SPHERE
Karen Johnson. Sep. 1979. 29 p. refs.
(NASA-TM-78249). Avail: NTIS. HC A03/MF A01. CSCL 20D.

A mathematical model is derived for heat loss due to radiation and free convection for a small copper sphere (approximately 0.3 to 0.4 cm diameter) cooled by a helium-argon gas mixture. A FORTRAN program written to simplify calculations and extend the range of applicability to experimentation is presented. Pressures used were less than 400 torr, and resulting temperatures ranged from 500 to 4600 K. Comparison of results for initial cooling by the gas mixture with experimental data showed a 5 percent error for temperature values and ± 2.7 percent error for the temperature difference caused by the cooling. Results indicate that the accuracy could be increased significantly by using better estimates for thermal conductivities. R.C.T.

FURTHER OBSERVATIONS ON TRANSITION IN A PIPE Interim Report, Mar. 1978 - Mar. 1979
Y. Rubin, I. Wygnanski, and J. H. Haritonidis. Jun. 1979. 43 p. refs.
(Contract AF AFOSR-3275-77; AF Proj. 2307).
(AD-A071909; AFOSR-79-0869TR). Avail: NTIS. HC A03/MF A01. CSCL 20/4.

Fully developed Poiseuille flow in a pipe was artificially disturbed at x/D = 400 and 17-RE-4000. Puffs and slugs generated by the disturbance were identical to the structures observed when the flow in the inlet region had undergone transition (Wygnanski and Champagne 1973). Since the disturbance was sufficiently strong to cause transition even at low Reynolds numbers the appearance of either puffs or slugs depended on the Reynolds number only. Velocity measurements in the pipe were taken with rakes of hot wires using digital acquisition methods and in this way each realization could be observed in its entirety. The coherence of the large structures was studied in radial and azimuthal directions. Puffs and slugs generated by the disturbance were mapped and found to be identical to the structures observed at the inlet region of the pipe. It was established that a slug which has all the attributes of a fully developed turbulent pipe flow is generated by a coalescence of puffs. The puff, which seems to contain a small number of toroidal eddies appears to be a fundamental coherent structure in a fully developed turbulent pipe flow. Previous observations, which were based on a single-point measurement and ensemble-averaged data did not reveal the full structure of the puff in the same detail as the present techniques. Single realizations were analyzed showing instantaneous velocity profiles, vorticity perturbation contours, as well as streamlines moving with the structure. Artificially generated successions of puffs which were allowed to interact, closely resembled a slug. The evolution of a slug from puffs was thus established. GRA

DEVELOPMENT OF CRITICAL FLUIDIC COMPONENTS
Kevin C. Chen and Vincent F. Neradka. 14 Jul. 1978. 79 p. refs.
(Contract DAAG39-77-C-0173).
(AD-A071650; HDL-CR-78-173-1). Avail: NTIS. HC A05/MF A01. CSCL 13/7.

This report is an independent assessment of the performance of three fluidic rate sensors which were provided for test. All tests were run using MIL-H-5606 hydraulic fluid. The results of the testing showed that the Fluidisc had the lowest threshold and null sensitivity, and that its output is sufficient to directly drive some hydraulic components. On the other hand the Laminar Angular Rate Sensor is the most economical sensor and its low noise and power consumption makes it the sensor having the most potential for future applications. GRA

GENERATION RATE OF TURBULENT PATCHES IN THE LAMINAR BOUNDARY LAYER OF A SUBMERSIBLE
C. P. Chen, Y. Goland, and E. Reshotko. Jun. 1979. 56 p. refs.
(Contract N00014-77-C-0005).
(AD-A071796; DT-7802-9). Avail: NTIS. HC A04/MF A01. CSCL 20/4.

Suspended particulate in the environment of underwater vehicles has been suspected to be responsible for the generation of turbulent patches in the laminar boundary layer of the vehicle. This speculation, which is supported by much indirect evidence, is examined in this report through an attempt at calculating the turbulent patch generation rate. The method presented herein is based on the premise that patches are generated by those particles entering the boundary layer that are sufficiently large to 'trigger' a turbulent event. Since the triggering mechanism is not known, the choice of a critical particle size will involve some empiricism. An important element of the method is the calculation of the number of particles of a given size and specific gravity that enter the laminar boundary layer, through computation of the particle trajectories in the inviscid flow field about the vehicle. NUMERICAL SOLUTION OF RECIRCULATING FLOW BY A SIMPLE FINITE ELEMENT RECURSION RELATION
D. W. Pepper and R. E. Cooper. 1979. 27 p. refs. Presented at the 2d Intern. Conf. on Computational Methods in Nonlinear Mech., Austin, Tex., 26-30 Mar. 1979.
(Contracts EY-76-C-09-0001).
(DP-MS-78-83; Conf-790311-4). Avail: NTIS. HC A03/MF A01.

A time-split finite element recursion relation, based on linear basis functions, is used to solve the two-dimensional equations of motion. Recirculating flow in a rectangular cavity and free convective flow in an enclosed container are analyzed. The relation has the advantages of finite element accuracy and finite difference speed and simplicity. Incorporating dissipation parameters in the functionals decreases numerical dispersion and improves phase lag. DOE

NUMERICAL SOLUTION OF TURBULENT FLOW PROBLEMS IN GENERAL GEOMETRY
E. L. Wachspress. Mar. 1979. 24 p. refs. Presented at Conf. on Appl. of Numerical Analysis, Dundee, UK, 26 Jun. 1979.
(Contract EY-76-C-12-0052).
(KAPL-4116; Conf-790620-1). Avail: NTIS. HC A02/MF A01.

Turbulent flow of fluid was computed satisfactorily with the TEACH program for a wide spectrum of problems. The TEACH geometry is restricted to rectangular grids in Cartesian or cylindrical coordinates. The TURF program uses the TEACH methodology with foursided isoparametric elements. This broadens modeling capabilities and enhances practical utilization of the TEACH method. It was discovered that a thorough understanding of TEACH numerics was essential for the desired geometry generalization. Crucial aspects of the analysis arise in study of the Navier-Stokes momentum and continuity equations without the complications associated with turbulence modeling common to TEACH and TURF. Among the devices in TEACH are direct computation of primitive variables, interlocking velocity and pressure grids, and derivation of pressure equations from integration over boxes of the continuity equation in which pressures do not appear explicitly. APPLICATION OF IMPLICIT NUMERICAL METHODS TO PROBLEMS IN TWO-PHASE FLOW
John H. Mahaffy and D. R. Liles. Apr. 1979. 15 p. refs.
(Contract W-7405-eng-36).
(NUREG-CR-0763; LA-7770-MS). Avail: NTIS. HC A03/MF A01.

A numerical method for treating two-phase flow in pipes is presented which incorporates the use of a partially implicit scheme in regions of relatively low flow velocity and a fully implicit treatment in regions of high velocity. This method takes advantage of the lower cost per iteration of the partially implicit scheme, without being limited by its conditional stability. Applications of this approach to water reactor blowdown calculations produce reductions in computer time by factors of 2-4 without a significant loss of accuracy. DOE

COUPLEFLO: A COMPUTER PROGRAM FOR COUPLED CREEPING VISCOUS FLOW AND CONDUCTIVE-CONVECTIVE HEAT TRANSFER. PART 2: USER'S MANUAL
P. F. Chavez and P. R. Dawson Nov. 1978 72 p refs
(Contract EY-76-C-04-0789)
(SAND-78-1407) Avail: NTIS HC A04/MF A01

A user manual for a two dimensional finite element code (COUPLEFLO) for plane strain or axisymmetric analyses of thermomechanically coupled systems is presented. It is capable of analyzing the creeping flow of non-Newtonian fluids or the secondary creep of solids. The program solves equations for conductive-convective heat transfer to determine the thermal response of a system. Thermomechanical coupling between the flow field and temperature distribution can exist in terms of temperature dependent material properties, temperature dependent body forces, viscous dissipation, material convection, and changing system geometry. Either transient or steady-state problems can be analyzed in Eulerian or quasi-Lagrangian reference frames. The governing equation, finite element formation, and verification of code capabilities are presented with the instructions for use. DOE

TWO-DIMENSIONAL TRANSIENT DISPERSION AND ADSORPTION IN POROUS MEDIA
R. V. Homsy 23 Apr. 1979 11 p refs Presented at 5th Underground Coal Conversion Symp., Alexandria, Va., 18 Jun. 1979
(Contract W-7405-eng-48)
(UCRL-81970; Conf-790630) Avail: NTIS HC A02/MF A01

Contaminant transport model was made of an underground aquifer following in situ coal gasification to determine the environmental impact on ground water. The aquifer was treated as a semi-infinite porous medium, bounded on top and bottom by impermeable parallel walls. Line, plane and finite-volume sources were studied. The two-dimensional convective-dispersion equation, which governs the rate of contaminant transport, was reduced to an ordinary differential equation and solved for an instantaneous source. Asymptotic series solutions valid for short and long times are given for a continuous-line source. DOE

GAS FLOW THROUGH POROUS BARRIERS M.S. Thesis
N. S. Jacobson Oct. 1978 29 p refs
(Contract W-7405-eng-48)
(LBL-8283) Avail: NTIS HC A03/MF A01

The possibility of CO2 surface diffusion through the porous BaO that results from BaCO3 decomposition is examined. CO2 and He flow rates through a BaO barrier are compared and both are found to exhibit similar behavior. Because He is known not to undergo surface diffusion, it is concluded that CO2 goes through BaO by ordinary Knudsen flow. The decomposition of SO3 to SO2 and O2 in a porous alumina barrier is studied. The goal is to determine if this reaction will equilibrate in the barrier. A stream of SO3 is run through the barrier and the exit gas compositions are determined as a function of temperature with a mass spectrometer. These compositions are found to differ considerably from the calculated equilibrium values, indicating the reaction does not equilibrate in the barrier. DOE

TEST PLAN FOR INTERMEDIATE RANGE AIRBLAST PROPAGATION MEASUREMENTS
J. W. Reed Dec. 1978 37 p refs
(Contract EY-76-C-04-0789)
(SAND-78-1703) Avail: NTIS HC A03/MF A01

An explosion test program is planned for firings at Cape Canaveral, Florida and Vandenberg Air Force Base, California to determine how atmospheric refraction influences explosion wave propagation. Meteorological data for correlation with airblast propagation results will be obtained from rawinsonde balloon ascensions and meteorological tower instruments. Blast pressure gages will be operated at distances of 200 m to 5 km in a cruciform array centered on the explosion area. This will allow evaluation of wind component effects in four directions from each explosion. The primary experimental goal is to correlate the airblast over-pressure distance decay rate and the sound velocity-altitude gradient in the atmospheric boundary layer. In addition, there will be exploration of (1) wind effects on height-of-burst Mach stem formation; (2) [illegible]fluences of low level winds and ground surface temperature on propagation; and (3) the attenuation caused by atmospheric turbulence. DOE

COMPARISONS OF RETRAN AND TWO-VELOCITY TWO-PHASE FLOW MODELS WITH EXPERIMENTAL DATA
Interim Report
E. D. Hughes and R. K. Fujita. Nov. 1978. 341 p. refs. Prepared for EPRI.
(EPRI Proj. 958-1)
(EPRI-NP-928) Avail: NTIS. HC A15/MF A01.

Several aspects of two-phase flow models and computer programs associated with steady-state and transient analyses of nuclear steam supply systems were investigated. The areas investigated include: comparisons of homogeneous equilibrium mixture and two-fluid model predictions with experimental data and with each other; numerical solution techniques; comparison of RETRAN predictions with experimental data; application of RETRAN to simple multi-dimensional flows; and derivation of macroscopic balance equations for two-fluid models of two-phase flows. The results of the investigations show the accuracy and ease of application of RETRAN, some of the limitations associated with homogeneous equilibrium mixture models of two-phase flow, and some of the areas in which RETRAN can be improved. DOE.

THE RESPONSE OF A TURBULENT BOUNDARY LAYER TO LATERAL DIVERGENCE
A. J. Smits, J. A. Eaton, and P. Bradshaw. Dec. 1978. 77 p. refs. Supersedes IC-Aero-TN-78-106. Submitted for publication.
(IC-Aero-78-03) Avail: NTIS. HC A05/MF A01.

Measurements in the axial flow over a cylinder-flare body of flare semi-angle 20 deg, the radius of longitudinal curvature of the transition piece between the cylinder and the conical flare being about 10 times the boundary layer thickness, are described. Analysis shows that the effects of this curvature die out so that the changes in second and third-order structural parameters found in the boundary layer on the flare can be attributed to lateral divergence. The destablizing effect of a given lateral strain rate is nearly the same as the effect of longitudinal curvature. Author (ESA)

TURBULENT BOUNDARY LAYERS ON SURFACES OF MILD LONGITUDINAL CURVATURE
P. H. Hoffmann and P. Bradshaw. Dec. 1978. 57 p. refs. Sponsored in part by Brown Boveri and Co., Baden, West Ger. Submitted for publication.
(Contract AT/2037/0171)
(IC-Aero-78-04) Avail: NTIS. HC A04/MF A01.

Detailed measurements were made on a rig in which boundary layers that have developed on flat surfaces enter a curved section with concave and convex wall radii about 100 times the initial boundary layer thickness. The data include second, third, and fourth-order mean products of velocity fluctuations and provide a consistent picture of the effects of curvature on structure parameters. Analysis shows that in general these structure parameters increase on the concave (destablized) side and decrease on the convex side, but some interesting nonmonitonic trends occur. This nonlinearity is analogous to that found in buoyant flows. Author (ESA)

Measurements of heat transfer to a cold surface at conditions simulating advanced aircraft gas turbine flow conditions are presented. They obtained under isothermal wall conditions in a short duration isentropic light piston tunnel using surface temperature transient techniques. The effects of external turbulence and strong favorable pressure gradient were especially studied. Results indicate that turbulence has little or no influence on the heat transfer in a turbulent boundary layer. However, turbulence level effects the heat transfer in a laminar boundary layer both with and without pressure gradient. Measurements were also compared with various viable predictive methods including simple correlations and finite difference approaches. Poor agreement was obtained between turbulent data and predictions selected for study (approximate integral, mixing length and one equation models). Author (ESA)

ALMOST PERIODIC N-SOLITON SOLUTIONS OF THE NONLINEAR HYDRODYNAMIC KAUP EQUATION [SOLUTIONS PRESQUE PERIODIQUES ET A N-SOLITONS DE L'EQUATION HYDRODYNAMIQUE NONLINEAIRE DE KAUP]
V. B. Matveev and M. I. Yavor (Nord-West. Politech. Inst., Leningrad). 1979. 22 p. refs. In FRENCH; ENGLISH summary.
(PM/79/10) Avail: NTIS. HC A02/MF A01.

The algebraic geometrical integration of some hydrodynamic equations is discussed. The vast class of almost periodical solutions containing N-soliton solutions as a degenerate case is found exactly. The asymptotic behavior of N-soliton solutions is calculated at the explicit isomorphism between the Kaup equation and the complexified nonlinear Schroedinger equation is obtained. Author (ESA)

A METHOD FOR THE MEASUREMENT OF MIXING PROPERTIES IN A TURBULENT JET FLOW
C. Borrego and D. Olivari. Jun. 1979. 32 p. refs. Sponsored in part by Avieiro Univ., Portugal.
(VKI-TN-130) Avail: NTIS. HC A03/MF A01.

An experimental investigation of the flow development of a turbulent air jet of circular cross section exhausting into still air was carried out in order to test a method for measuring certain parameters relevant to the mixing process. The measurement method involves laser equipment in combination with the introduction of a tracer in the jet in the form of oil smoke. The flow field was examined at locations varying from two to twenty diameters downstream of the nozzle. A laser doppler velocimeter and a laser scatter system were used to measure flow velocity and tracer concentration. Main parameters recorded at each downstream station were mean axial velocity, mean concentration, fluctuating velocity and concentration, and velocity-concentration correlation. Results show that the method permits an accurate description of the nozzle fluid concentration and velocity fields for a round turbulent free jet. Measurements are in general agreement with data from other sources. Author (ESA)

A STUDY OF COHERENT STRUCTURES IN AXISYMMETRIC JETS USING AN OPTICAL TECHNIQUE
Gautam T. Kalghatgi. Jun. 1979. 38 p. refs.
(Contract MIN-DEF/AT/2040/084)
(AASU-341) Avail: NTIS. HC A03/MF A01.

Coherent structures in the first six diameters of five axisymmetric jets of different velocities and densities were studied by an optical method using the deflection of laser beams caused by density gradients in the flow. Results show that the average

interval between succesive events increases with axial distance independently of the density, velocity, or Reynolds number of the jets and that near the nozzle exit plane the interval is very similar to that found for two dimensional mixing layers. The proposition that there are random interactions between the coherent structures as they are convected downstream is used to explain many of the observations. Author (ESA)

SMALL CONDUCTIVE PARTICLE SENSOR Patent Application
Israel Taback, inventor (to NASA) (Bionetics Corp., Hampton, Va.) Filed 28 Aug. 1979 14 p. Sponsored by NASA
(NASA-Case-LAR-12552-1; US-Patent-Appl-SN-070366) Avail: NTIS HC A02/MF A01 CSCL 14B

This invention is an electrostatic conductive fiber detector for use in detecting, counting and measuring the length of fibers down to 0.1 mm and below with increased accuracy and reliability over prior art devices. It can be used for detection of fibers suspending in a flowing gas, in a nonflowing gas, or in a vacuum and its accumulated counts over a period of time is essentially unaffected by velocity of the fibers being detected. EVALUATION OF COMMERCIALLY AVAILABLE SUBMERSIBLE PRESSURE GAUGES
James R. Middleton Mar. 1979 25 p.
(AD-A071481; NEDU-3-79) Avail: NTIS HC A03/MF A01 CSCL 14/2

Fourteen commercially available submersible pressure gauges were evaluated by the Navy Experimental Diving Unit to determine accuracy and watertight integrity. The gauges tested represent a realistic survey of the market. While not every gauge currently sold in the U.S.A. was tested, the results of this test are felt to represent the general state-of-the-art in gauge design and manufacturing technique. As a result of unmanned testing, and due to the overall quality of design and construction, it is recommended that submersible pressure gauges be designated as open purchase items on the list of equipment Approved for Navy Use (ANU). It should be emphasized to all divers that submersible pressure gauges should be given the same care as that given other life supporting equipment. GRA

SOLUTION MICROCALORIMETER FOR MEASURING HEATS OF SOLUTION OF RADIOACTIVE ELEMENTS AND COMPOUNDS Ph.D. Thesis
D. L. Raschella Dec. 1978 95 p. refs
(Contract W-7405-eng-26)
(ORO-4447-081) Avail: NTIS HC A05/MF A01

An isoperibol solution microcalorimeter capable of measuring the heats of solution of submilligram quantities of radioactive elements and compounds was constructed. The calorimeter was tested by measuring heats of solution of TRIS and magnesium metals. The heat of solution of curium-248 metal was then measured in 1 N HCl at 298 K. The experiments yielded a heat of solution of -606.4 + or - 1.8 kJ/mol. A single measurement in 6 N HCl gave a heat of solution of -602.3 kJ/mol. From these results the heat of formation of Cm/sub (aq) is calculated to be -607.2 + or - 2.5 kJ/mol. K.L.

USE OF INDEXED SENSITIVITY FACTORS IN THE ANALYSIS OF NICKEL AND IRON BASED ALLOYS: STUDY OF THE DECALIBRATION OF SHEATHED CHROMEL/ALUMEL THERMOCOUPLES
W. H. Christie 1978 7 p. refs Presented at the US-Japan Seminar on SIMS, Osaka, 23 Oct. 1978
(Contract W-7405-eng-26)
(CONF-781076-1) Avail: NTIS HC A02/MF A01

Sheathed Chromel versus Alumel thermocouples decalibrate when exposed to temperatures in excess of 1100 C. Thermocouples sheathed in Inconel-600 and type 304 stainless steel were studied. Quantified SIMS data showed that the observed decalibrations were due to significant alterations that took place in the Chromel and Alumel thermoelements. The amount of alteration was different for each thermocouple and was influenced by the particular sheath material used in the thermocouple construction. Relative sensitivity factors, indexed by a matrix ion species ratio, were used to quantify SIMS data for three nickel-based alloys, Chromel, Alumel, and Inconel-600, and an ion-based alloy, type 304 stainless steel. Oxygen pressure ~ 2 x 10 to the 6th power torr in the sputtering region gave enhanced sensitivity and superior quantitative results as compared to data obtained at instrumental residual pressure. DOE

DESIGN OF A HIGH PRECISION DILATOMETER USING LASER INTERFEROMETRY
W. D. Drotning Dec. 1978 29 p. refs
(Contract EX-76-C-04-0789)
(SAND-78-1796) Avail: NTIS HC A03/MF A01

The dilatometer described is being designed for operation from ambient to 800 C using samples which require minimal preparation. Several interferometric techniques useful to dilatometry were reviewed from the literature. As a result of this review and establishment of performance criteria, a technical design is proposed. The optical design incorporates a two-frequency He-Ne laser with ac detection in a modified Michelson interferometer. A vertical sample/furnace configuration appears

to offer a number of design advantages. Operational considerations and dilatometer development costs are also presented. DOE

CONCEPT AND FEASIBILITY STUDY ON A VERY WIDE ANGLE PHOTOGRAPHIC CAMERA FOR SPACELAB Final Report
Rainer Krieger, Stephan Koschade, Ursula Kriete, Peter Vits, and Peter Henneberg Bonn Bundesmin. fuer Forsch. u. Technol. Dec. 1977 173 p refs In GERMAN; ENGLISH summary
(Contracts BMFT-WRT-1075; DFVLR-BPT-01-QV-595-V22)
(BMFT-FB-W-77-17) Avail: NTIS HC A08/MF A01; ZLDI, Munich DM 36,10

With a ground version of a wide angle camera, proper images of large scale galactic structures were obtained within the range 2000 to 20,000 A. For SPACELAB applications, a similar instrument can be developed with increased spectral range to 900 A. For this purpose basic analysis was necessary regarding the optics and the detector system. Furthermore, investigations on filters, reflecting surfaces, and spectral shifters as well as on mechanical problems and compatibility with SPACELAB were necessary to establish and select feasible concepts. The increased spectral range turned out to be feasible only by mirror optics. A promising alternative to photographic film is the microchannel plate-detector still under development. Problems remain regarding sensitivity between 900 and 1100 A, but results do not rule out a possible solution. Author (ESA)

AN ABRADING SYSTEM FOR THE MEASUREMENT OF OXIDE THICKNESS
R. Wilson, inventor Jan. 1979 4 p
(TDB-319) Avail: NTIS HC A02/MF A01

A device for the measurement of oxide or other coating thicknesses is described. The device was designed primarily for the remote measurement of oxide thickness inside a shutdown nuclear reactor. The oxide is removed over a region 1 mm in diameter by an air jet containing a controlled amount of abrasive powder. A high precision linear displacement transducer is used to measure the oxide thickness at this position. The technique is suitable for thickness in the range 10 to 2500 micron. An accuracy of + or - 5 micron is attainable. Author (ESA)

SHUTTLE ATMOSPHERIC LIDAR RESEARCH PROGRAM Final Report
1979 231 p
(NASA-SP-433) Avail: NTIS HC A11/MF A01 CSCL 20E

The Shuttle atmospheric lidar program is discussed in relation to an understanding of the processes governing the Earth's atmosphere and in the capacity to evaluate the atmospheric susceptibility to manmade and natural perturbations. Applications of the lidar which are discussed are the determination of the global flow of water vapor and pollutants in the troposphere, improvement of chemical and transport models of the stratosphere and mesosphere, evaluation of radiative models of the atmosphere, investigation of chemistry and transport of thermospheric atomic species, and investigation of magnetospheric aspects of sun/weather relationships. The features of the lidar measurements discussed are the high spatial resolution, control of the source wavelength and intensity, and high measurement specificity. For individual titles, see N80-11415 through N80-11428.

SCIENTIFIC OBJECTIVES Final Report
In its Shuttle Atmospheric Lidar Res. Program 1979 p 7-9 refs (For primary document see N80-11414 02-36)
Avail: NTIS HC A11/MF A01 CSCL 20E

The features of the shuttle lidar experiments considered are the very good veritcal resolution when used in the pulsed mode, fine horizontal resolution with the capability to probe the troposphere between the clouds, and very high sensitivity in aerosol and thin cloud detection. The ability to select atmospheric constituents by narrow spectral features, such as in resonant scatter or in absorption, the ability to measure temperatures of these constituents by the spectral shape of the features, given

adequate spectral purity of the laser, the ability to obtain global scale data rapidly, and the ability to point the lidar system in any direction, subject to the restriction of slew rate and scattered sunlight, are discussed. A.W.H.

In its Shuttle Atmospheric Lidar Res. Program 1979 p 24-33 refs (For primary document see N80-11414 02-36)
Avail: NTIS HC A11/MF A01 CSCL 20E

The tests and improvements for models of stratospheric and mesospheric chemistry and transport are discussed. The structure of the stratosphere and mesosphere, in terms of chemistry and dynamics, is reviewed. Current satellite experiments for long duration observation, focused on the measurement of aerosols and gases involved in the ozone-nitrogen chemistry of the stratosphere, are discussed. Future satellite experiments and Shuttle lidar contributions are proposed. A.W.H.

N80-11418*# National Aeronautics and Space Administration, Washington, D. C.
SCIENTIFIC OBJECTIVE 3: RADIATIVE MODELS
In its Shuttle Atmospheric Lidar Res. Program 1979 p 34-45 refs (For primary document see N80-11414 02-36)
Avail: NTIS HC A11/MF A01 CSCL 20E

The testing and improvements for atmospheric models of radiation, radiatively active substances, and radiative effects are discussed. The tests and improvements encompass two research areas. The first is that of providing input data for models which describe radiative energy exchange in the earth's atmosphere and the effects on this exchange of altered atmospheric composition. The second is that of providing input data for studies which test the basic assumptions used to analyze data from passive remote sensors. The alterations in the radiative energy exchange which alter the climate are examined. A.W.H.

SHUTTLE ATMOSPHERIC LIDAR PROGRAM EVOLUTION
In its Shuttle Atmospheric Lidar Res. Program 1979 p 89-94 (For primary document see N80-11414 02-36)
Avail: NTIS HC A11/MF A01 CSCL 20E

Because many of the specific lidar measurements of interest in the late 1980's cannot yet be foreseen, the hardware approach for a shuttle lidar system should be both modular and evolutionary. With a modular approach, the distinct components (laser transmitter, telescopic return-signal collector, detector, and data processing electronics) are readily interchangeable and can be replaced as appropriate to changing measurement needs and technology developments. With an evolutionary approach, the initial hardware complement for the simplest early experiments will be augmented by subsequent hardware additions to expand the lidar capability for more complex and more technologically demanding experiments. A.R.H.

APPENDIX B: LASERS OF POTENTIAL USE FOR SHUTTLE LIDAR
In its Shuttle Atmospheric Lidar Res. Program 1979 p 163-174 ref (For primary document see N80-11414 02-36)
Avail: NTIS HC A11/MF A01 CSCL 20E

The remote identification of particulates as well as atomic and molecular species from the Space Shuttle platform requires pulsed lasers for active (lidar) detection or CW lasers for passive (heterodyne) detection. The detection of atomic species usually limits the laser source to the visible or ultraviolet spectral regions, while molecular species have many of their spectral signatures (vibrational-rotational transitions) in the mid-infrared (2 to 20 micron m). The detection of particulates (clouds and aerosols) is best done using lasers which operate in the visible to the near infrared regions where elastic scattering cross sections are large. Topics discussed include Nd:Yag lasers, carbon dioxide lasers, dye lasers, rare gas-halide lasers, semiconductor lasers, and nonlinear conversion of laser frequency. A.R.H.

N80-11427*# National Aeronautics and Space Administration, Washington, D. C.
APPENDIX C: TRANSMITTING AND RECEIVING OPTICS CONSIDERATIONS
In its Shuttle Atmospheric Lidar Res. Program 1979 p 175-192 ref (For primary document see N80-11414 02-36)
Avail: NTIS HC A11/MF A01 CSCL 20E

To define detailed requirements for a Shuttle lidar receiving optics system, the application or set of applications for which it is to be used must be considered. Fortunately, however, most atmospheric applications require a similar class of receiving optics which is well within the state of the art and, therefore, general requirements can be bounded. Limits for the various hardware parameters can be used to produce an initial design concept. Convolved with these hardware considerations, such as instantaneous field of view, area, baffling, wavelength range, size, weight, thermal and mechanical stability, surface quality, etc., are economic trade-offs, such as cost and Shuttle power versus weight, and considerations for eye safety. In addition, considerations for pointing and the accommodation of different detection systems must be examined. A.R.H.

N80-11428*# National Aeronautics and Space Administration, Washington, D. C.
APPENDIX D: SPECTRAL DISCRIMINATORS AND DETECTORS FOR SHUTTLE LIDAR
In its Shuttle Atmospheric Lidar Res. Program 1979 p 193-218 refs (For primary document see N80-11414 02-36)
Avail: NTIS HC A11/MF A01 CSCL 20E

Possible methods and hardware available for spectrally isolating (or analyzing) and for detecting the received lidar signal are surveyed. The most promising candidates are summarized, and other candidates and more detailed characteristics of all candidates are described. A.R.H.

LASER IRRADIANCE IN THE SEA: THEORY AND EXPERIMENT
Lloyd C. Bobb, Gerald Ferguson, and Michael Rankin Sep. 1978 45 p refs
(ZR00001)
(AD-A072601; NADC-78253-30) Avail: NTIS HC A03/MF A01 CSCL 20/5

Laser beam spreading due to the air/sea interface, volume scattering, and initial beam divergence is modeled. Beam steering is considered for the case in which the laser beam diameter is small compared to the length of the refracting wave. An expression is developed for the irradiance as a function of depth into the ocean. A comparison of the terms in this expression shows that the surface spreading effect is small compared with bulk scattering. Wavetank experiments were performed. The height, slope, and frequency content of wind-driven capillary waves are reported for wind speeds in the range 2.2 m/sec to 7.6 m/sec. GRA

INJECTION LASER DIODES FOR FIBER OPTIC COMMUNICATIONS Quarterly Report, 1 Jul. - 30 Sep. 1977
Rob Adair 15 Jun. 1978 41 p
(Contract DAAB07-76-C-0040)
(AD-A072504; QR-5) Avail: NTIS HC A03/MF A01 CSCL 09/1

The design and fabrication of injection laser diodes for use in fiber optic communications is discussed with regard to material synthesis, chip configuration, and device assembly in manufacturing environment. The opto-electronic source is based on the GaAs-GaAlAs double heterojunction structure and consists of a parallel array of lasers formed by the application of triple stripe geometry to the surface of the epitaxial wafer. The monolithic triad of discrete lasing elements is mounted in a high frequency package which incorporates a high quality optical window. GRA

OPTICALLY PUMPED FAR INFRARED LASERS Final Report, 1 Aug. 1978 - 31 Jan. 1979
T. A. DeTemple and Paul D. Coleman Mar. 1979 45 p refs
(Grant DAAG29-78-G-0128)
(AD-A071836; UILU-ENG-79-2547; ARO-15641.2-P) Avail: NTIS HC A03/MF A01 CSCL 20/5

Experiments and theory regarding the emission processes in optically pumped far infrared laser sources are reported. Super-radiance from CH3F at 496 micrometers in the homogeneously broadened regime has been identified for the first time. Stimulated Raman emission on pure rotational transitions in D2O at 50 and 66 micrometers has also been identified for the first time. Generally good agreement between experiments and a Maxwell-Bloch approach was obtained for the super-radiance study, and good qualitative agreement between experiments and a Maxwell-density matrix approach using three waves interacting in a four-level system was noted for the Raman study; both implying that the processes are now reasonably well characterized and understood. GRA

LASER PHYSICS AND LASER TECHNIQUES Annual Report, 1 Jan. - 31 Dec. 1978
A. E. Siegman and R. L. Byer Apr. 1979 177 p refs
(Contract F49620-77-C-0092; AF Proj. 2301)
(AD-A072009; GL-2953; AFOSR-79-0891TR) Avail: NTIS HC A09/MF A01 CSCL 20/5

A program of basic research in laser physics and laser techniques has been carried out in order to help meet Air Force mid-term and long-term requirements as outlined in the AFSC Research Planning Guide. A Fast Hankel transform algorithm has been developed and applied to nonlinear interactions and to diffraction biased resonators studies. Picosecond spectroscopy via the induced grating approach has been successfully used to study fast relaxation processes. Optical parametric amplifiers and oscillators have been shown to be useful sources of coherent radiation over the 0.4 to 4 micrometers spectral range. Finally, stimulated Raman scattering and four-wave mixing has been used for efficient frequency conversion in the infrared. Detailed studies have shown excellent theoretical and experimental agreement in the Raman interactions. GRA

ADVANCED LASER CONCEPTS. ADDENDUM: PRODUCTION OF EXCITED STATES Final Report, 6 Apr. 1976 - 6 Dec. 1977
D. J. Miller Kirtland AFB, N. Mex. AFWL May 1979 101 p refs
(Contract F29601-76-C-0065; ARPA Order 2861; AF Proj. 1256)
(AD-A071393; AFWL-TR-77-234) Avail: NTIS HC A06/MF A01 CSCL 20/5

Experiments are described which use an exclusively chemical system to generate the necessary reagents and energy transfer partners required for production of the a 1 Delta and b 1 Sigma - electronic excited states of the NF molecule. The purpose is to assess the potential for the development of an electronic transition chemical laser operating on the NF transitions at wavelengths of 874 nm or 529 nm. In the first of these experiments, staged combustion in a laser cavity is employed by adding a second mixer downstream from the cavity mixer in a conventional, supersonic, diffusion mixing HF chemical laser. This allows for the mixing of F-atoms, H2, and N2F4 the starting reagents required in the NF system. The second set of experiments utilized a tristream HF chemical laser nozzle which allows the three reagents F-atoms, H2, and N2F4 to be mixed in the throat of a supersonic slit nozzle. In both sets of experiments, thermal dissociation of N2F4 was the limitation for the final concentration of NF excited states. In both experiments the quenching of NF excited states is slow. GRA

RIGOROUS DERIVATION OF GENERAL DISPERSION RELATIONSHIP FOR GYROTRON
Saeyoung Ahn and Joon Y. Choe Jul. 1979 42 p refs
(AD-A072005) Avail: NTIS HC A03/MF A01 CSCL 20/5

General dispersion equation for the electron cyclotron maser instability in co-axial cylindrical geometry is derived in the framework of linearized Vlasov-Maxwell system. While previous works have been carried out for the azimuthally symmetric mode and for the specified equilibrium electron distribution function in simple waveguide structure, we have extended our analysis to include the azimuthally mode with general equilibrium distribution function. After selfconsistent analysis of the equilibrium distribution function, we have solved the orbit integral for the perturbed distribution function closely following the previous analysis by Chu, and have derived a new rigorous formal dispersion equation for arbitrary equilibrium distribution function. The resulting equation is useful to find the dispersion relation of electron beam with spread in energy and momenta. A closed form of dispersion relation for the cold beam electrons is given as an example. GRA

MODELING STUDIES OF THE MIXING AND CHEMISTRY OF THE NF RADICALS ON THE TRISTREAM NOZZLE Final Report
R. A. Armstrong and N. L. Rapagnani Jun. 1979 27 p refs
(AF Proj. 3326)
(AD-A071315; AFWL-TR-78-263163) Avail: NTIS HC A03/MF A01 CSCL 20/5

Among the many systems being investigated in the effort to develop a thermochemically pumped electronic transition laser, the NF radical has shown high promise. This report describes the modeling completed to evaluate an NF mixing concept. Calculations were made with varying expansion ratios, both in the nozzle and cavity, to determine the optimum throat pressures, throat temperatures and element lengths. The mixing concept as described is very promising and could last if the optical path length is long enough. GRA

FLUORESCENCE DIAGNOSTICS IN TWO-STEP LASER EXCITATION OF HIGH J ATOMS
Richard C. Stern, Bruce W. Shore, and Neil C. Lang. 5 Apr. 1979. 15 p. Presented at ACS Conf., Honolulu, Haw., 1 Apr. 1979
(Contract W-7405-eng-48)
(UCRL-81746; Conf-790415-14) Avail: NTIS HC A02/MF A01

Using a pair of lasers near 6000 A, the J = 6 ground state is excited to a J = 6 intermediate level and then to a J = 5 upper state. Nonresonant fluorescences from both excited states are separately detected. Results of a set of model calculations are tabulated. Level 3 average populations are always very small, since the system decays rapidly into inaccessible metastable states. This means that chmistry experiments are difficult. The differences between parallel and perpendicular polarization are modest. The fluorescence dips converge to a value near 50%. The level 3 populations do not approach a common value. This means that the most reliable experimental measurement does not determine the level populations. The most striking changes appear in the last two, most exact, models. The difference between the models is that one includes, for the first time, the linear frequency chirp produced by the fanlike spread of the focussed laser beams. This seemingly innocuous change halves the population left in the ground state. DOE

RADIAL ELECTRON BEAM LASER EXCITATION: THE REBLE REPORT
J. J. Ramirez and Kenneth R. Prestwich. Oct. 1978. 101 p. refs
(Contract EY-76-C-04-0789)
(SAND-78-2005) Avail: NTIS HC A06/MF A01

The results of an investigation of techniques to generate high power radially converging electron beams and the application of these beams to gas lasers was discussed. The design and and performance of the REBLE accelerator that was developed is presented. The measured total and spatially resolved energy deposition of this radial electron beam in various gases is compared with Monte Carlo calculations. In most cases, these codes give an accurate description of the beam transport and energy deposition. With the electron beam pumping xenon gas, the amplitude of xenon excimer radiation (1720 A) a radially uniform to within the experimental uncertainty. The efficiency of converting

deposited electron beam energy to xenon excimer radiation is 20%. DOE

MEASUREMENT OF FLUORESCENCE DECAY TIMES OF LASER DYES. 1. BEHAVIOR OF RIGID AND MOBILE MEDIA WITH RESPECT TO SIGNAL EXTRACTION AND SIGNAL PROPAGATION, 2
P. P. Hammond 3 Jul. 1978 16 p Presented at the Office of Naval Res. Review Meeting, Cambridge, Mass., 8 Sep. 1978
(Contract W-7405-eng-48)
(UCRL-81568; Conf-780965-1) Avail: NTIS HC A02/MF A01

Experimental techniques are described that distinguish or avoid these errors and that permit the measurement of accurate decay times and quantum yields. As a signal propagates and amplifies in a dye laser medium, the average excited state lifetime expectancy, or turnover time of the dye molecules becomes shorter and shorter. As it becomes comparable to the orientational relaxation time, propagation occurs through a mobile, viscous and rigid medium in turn. Extraction of stored energy and signal propagation are examined for the two extreme situations-mobil and rigid media. DOE

LASER INDUCED DAMAGE IN FLUORIDE GLASSES: A STATUS REPORT
S. E. Stokowski, D. Milam, and M. J. Weber 27 Sep. 1978 15 p refs Presented at the Symp. on Opt. Mater. for High Power Lasers (Damage Symp.), Boulder, Colo., 12-14 Sep. 1978
(Contract W-7405-eng-48)
(UCRL-81358; Conf-780977-3) Avail: NTIS HC A02/MF A01

Bulk and surface damage thresholds of fluorophosphate and fluoroberyllate glasses have been measured for 1-ns 1064-nm laser pulses. For crystal-free samples, threshold values for fluoride glasses are comparable to those measured in optical quality fused silica and borosilicate glasses. However, for many samples investigated, the presence of solid inclusions results in low damage thresholds. Some examples of solid inclusions are shown and discussed. Surface damage thresholds in FK-51 fluorophosphate glass are uniformly high and exhibit an approximated square root dependence on pulse duration in the range of 0.1 to 1.0 ns. DOE

CHARACTERISTICS OF LASER CUTTING KEVLAR LAMINATES
R. A. VanCleave Jan. 1979 28 p refs
(Contract EY-76-C-04-0613)
(BDX-613-2075-Rev) Avail: NTIS HC A03/MF A01

Comparison of laser-cut and machined samples of Kevlar/epoxy laminates has shown that material properties are not degraded by use of the laser. With present techniques and a 1000-W CO2 laser, the maximum laminate thickness that can be cut satisfactorily is 9.5 mm. Power requirements, edge taper, and kerf width for various thicknesses were established. Partial depth cuts, controlled and repeatable to within 0.5 mm, were produced in Kevlar/epoxy laminates by scanning the material under a pulsed beam. Fumes produced during cutting operations require proper exhaust methods to avoid long exposures to benzene, a potential carcinogen. DOE

LASER SCANNING CAMERA
M. Jagger, inventor May 1979 4 p
(TDB-324) Avail: NTIS HC A02/MF A01

A camera suitable for inreactor surveys is described. The camera embodies a scanning principle similar to that in the scanning electron microscope. It consists of a laser beam scanning head and a photosensitive detector. The scanning head consists of two plane mirrors which vibrate about orthogonal axes arranged in such a way that a laser beam, when directed into the arrangement, will be doubly reflected and emerge to scan in a raster over the surface of the object to be examined. The amount of light reflected at any time is controlled by the properties of the surface at each point in the scan and thus the signal from the detector can be used to modulate the brightness of a TV raster scanned in synchronism with the laser beam to produce a TV picture of the object. NEODYMIUM YAG LASERS. A BIBLIOGRAPHY WITH ABSTRACTS Progress Report, 1964 - Jul. 1979
Brian Carrigan. Sep. 1979. 172 p. Supersedes NTIS/PS-78/0808.
(NTIS/PS-79/0883/3; NTIS/PS-78/0808) Avail: NTIS. HC $28.00/MF $28.00. CSCL 20E.

Federally-funded research reports on lasing of neodymium doped yttrium aluminum garnet are cited. Studies on design, fabrication, quantum efficiency, light pulses, stabilization, and testing are covered. Optical pumping, mode locking, frequency conversion, and modulation of these lasers are discussed. Laser applications such as optical communications range finding, and tracking are included. Safety hazards and radiation damage related to neodymium YAG lasers are also covered. This updated bibliography contains 166 abstracts, 17 of which are new entries to the previous edition. GRA

INDUCTION HEATING GUN Patent Application
John D. Buckley, Robert J. Swaim, and Robert L. Fox, inventors (to NASA). Filed 24 Aug. 1979. 14 p.
(NASA-Case-LAR-12540-1; US-Patent-Appl-SN-069429) Avail: NTIS. HC A02/MF A01. CSCL 13I.

A device was developed for inductively heating and fusing thermoplastics. The device includes an alternating current passing

through a tank circuit and an inductor member of the tank circuit being wrapped around a curved pole piece of a ferromagnetic material. The magnetic flux arising within the inductor coil member flows to the ends of the pole piece and into a screen placed between the materials to be joined. The flux induces a current in the screen, and heat is generated to melt the thermoplastics together. Because only 30-150 watts of power are passed through the tank circuit, a wire which will remain cool under operational wattage may be selected, making air or fluid cooling unnecessary. NASA

ONE STEP DUAL PURPOSE JOINING TECHNIQUE
John D. Buckley, Robert J. Swaim, and Robert L. Fox, inventors (to NASA) 30 Aug. 1979 9 p
(NASA-Case-LAR-12595-1; US-Patent-Appl-SN-070774) Avail: NTIS HC A02/MF A01 CSCL 13I

A fastener to be used between two organic matrix composite objects for induction heating and joining purposes was developed. The fastener is comprised of a wire screen made of a high resistance, low reluctance material such as carbon steel. Selected wires of copper or similar conductive material, are integrated within the screen; these wires are insulated in a sheath 20 of enamel or similar oxidation-resistant, high temperature sustaining material. When placed between two sheets of thermoplastic, the screen may be used for induction heating and fusing of the thermoplastic. Upon application of inductive heating technique, the wires become hot and cause the thermoplastic to melt and fuse together around the screen. After cooling, the wires are capable of carrying electric current along the now-joined thermoplastics. The novel feature of the invention is the inclusion of conductive elements in an inductive heating fastener. NASA

PRSA HYDROGEN TANK THERMAL ACOUSTIC OSCILLATION STUDY Final Report
D. H. Riemer Sep. 1979 76 p refs
(Contract NAS2-10229)
(NASA-CR-152319; BAC-ER-14887) Avail: NTIS HC A05/MF A01 CSCL 13G

The power reactant storage assembly (PRSA) hydrogen tank test data were reviewed. Two hundred and nineteen data points illustrating the effect of flow rate, temperature ratio and configuration were identified. The test data were reduced to produce the thermal acoustic oscillation parameters. Frequency and amplitude were determined for model correlation. A comparison of PRSA hydrogen tank test data with the analytical models indicated satisfactory agreement for the supply and poor agreement for the full line. R.C.T.

DEVELOPMENT OF LASER WELDING TECHNIQUES FOR JOINING ARMOR
F. D. Seaman 31 Mar. 1979 24 p
(Contract DAAK30-78-C-0118)
(AD-A072537; IITRI-B6157-Q2) Avail: NTIS HC A02/MF A01 CSCL 13/8

The multikilowatt laser as an industrial tool in the production line has now been accepted for three years. Recently, the laboratory feasibility of heavy-penetration laser welding was demonstrated in low strength steel. This program describes the establishment of laser welding process parameters that will produce a sound, cost-effective joint with ballistic potential of 1 1/2 in. armor plate. Sufficient production, test, and operational data will be prepared to permit a detailed analysis of the achievement of this objective and repeatability of the process. GRA

DEVELOPMENT OF IMPROVED ABRADABLE COMPRESSOR GAS PATH SEAL Final Report, 20 Sep. 1976 - 19 May 1978
W. P. Jarvi and A. R. Erickson Jul. 1978 140 p
(Contract F33615-76-C-5302; AF Proj. 7312)
(AD-A072171; ER-382; AFML-TR-78-101) Avail: NTIS HC A07/MF A01 CSCL 21/5

A number of fiber metal systems were evaluated by rig testing in comparison with the base line material, FM-521 - a 19% dense, Haynes 188, 8 micron fiber metal - which is the standard production material used for the highest temperature compressor blade tip seals in the P and WA F-100 engine. A range of densities and strengths of alternative materials were evaluated including Haynes 188, FeCrAlY, NiCrAlY, and FeNiCrAlY employing fiber diameters in the range of 8 - 23 microns with fiber aspect ratios in the range of 45 - 80. Rig tests employed were high speed rub testing, cyclic static oxidation, cyclic dynamic oxidation, and hot particulate erosion. These data were supplemented with measurements of mechanical, thermal, and chemical properties. The best material tested was a 20.5% dense FeNiCrAlY fiber metal employing 17 micron fibers. This had at least equivalent abradability and improved oxidation and erosion resistance in comparison with the base line material. GRA

ELECTRON-BEAM BRAZE WELDING OF BERYLLIUM
M. A. Perkins 19 Sep. 1978 28 p refs
(Contract W-7405-eng-26)
(Y-2138) Avail: NTIS HC A03/MF A01

Electron beam braze welds were made in beryllium by using less than the recommended amount of aluminum filler metal. The welds exhibited a tendency to form microcracks prior to the termination of solidification; however, these microcracks were healed by the backfilling action of the aluminum/beryllium eutectic present in the fusion zone. Adverse effects attributable to the prior microcracking condition were not found. DOE

METALLIC WEAR PARTICLES: A SHORT REVIEW
Jose Rendon Feb. 1978 19 p refs
(UPTEC-78-11-R) Avail: NTIS HC A02/MF A01

A classification of various metal surface wear particles according to shape as well as type of wear formation is presented. The different wear mechanisms involved, such as rubbing wear, cutting wear, surface fatigue wear, and corrosion wear, are discussed and related to the physical characteristics of the wear particles they produce. The discussion is supported by micrographs taken with a scanning electron microscope. Finally, methods for recovering wear particles for quantitative analysis of machine parts wear are briefly described and the analysis of wear particles as a way of understanding wear is considered. STUDIES OF ABRASIVE WEAR IN A MODIFIED IMPACT TESTING MACHINE
Ulf Bryggman, Sture Hogmark, and Olof Vingsbo Sep. 1976 32 p refs
(UPTEC-78-79-R) Avail: NTIS HC A03/MF A01

Single tip abrasive wear was simulated in a conventional impact test machine modified by attaching a cemented carbide tip radially to the hammer. The swinging hammer produced a groove in the horizontal surface of low carbon steel of specimens, supported by a specially designed holder. Microstructure studies, using optical microscopy, scanning electron microscopy, and transmission electron microscopy, reveal the formation of successive layers of different structures, which are related to measured variations in microhardness under the groove bottom surface. Also, repeated grooving in the same track was performed in order to simulate normal abrasion. The energy consumed during grooving is given by the loss of potential energy of the pendulum and was read with the aid of the standard equipment of the impact tester. It proved possible to obtain a significant differentiation between the steels to consumed grooving energy. Author (ESA)

A COMPARISON OF FIVE METHODS FOR CALCULATING THE EXHAUST FLOW FROM INTERNAL COMBUSTION ENGINES [CONFRONTO TRA CINQUE METODI DI CALCOLO DEI CONDOTTI DI SCARICO DEI MOTORI ALTERNATIVI]
Andrea Dadone and Francesco Varrese Apr. 1978 35 p refs In ITALIAN; ENGLISH summary
(Contract CNR-76-00771.07)
Avail: NTIS HC A03/MF A01

A Euler equations method, a conservation equations method, Ferrai-Toti's method, the Goyal-Scharpf-Borman Method, and the Issa-Spalding method were compared in terms of their application to the integration of the differential equations pertaining to the one dimensional unsteady flow in internal combustion engine exhaust systems. Theoretical results were compared with experimental ones, reported in the literature, obtained with a one cylinder engine exhaust system. The comparison involved varying the mesh number. The Euler equations method gives the best results, but Ferrari-Toti's method and the conservation equations method are also satisfactory. On the contrary, the Goyal-Scharpf-Borman method requires too much computation time and the Issa-Spalding method results are unsatisfactory. Author (ESA)

STRUCTURAL ANALYSIS OF A 15,000 TONS 'O' PRESS
Bruno Atzori, Franco Fresa, and Oronzo Giordano (Italsider) 1978 21 p refs
Avail: NTIS HC A02/MF A01

The stresses related to a 15,000 ton 'O' press under working conditions were analyzed using a modified version of the computer program STRUDL 2. Results were compared with experimental values obtained by strain gage measurements. Several mathematical models were considered in order to determine the effects of load distribution and the idealization of external constraints. The accuracy of the results given by the different models was examined in terms of the structural analysis performed, taking into account its associated difficulties. The good agreement between numerical and experimental results confirms the effectiveness of STRUDL 2 in studying complex mechanical structures. Author (ESA)

RANKING TIRES USING A TRANSIENT SPEED-TIME CYCLE
Richard N. Burgeson Mar. 1979 19 p refs
(PB-297756/9; SDSB-79/14) Avail: NTIS HC A02/MF A01 CSCL 13F

The ability to rank passenger car tires according to their respective rolling resistance facilitates emission and fuel economy testing and can serve as a consumer buying aid. However, at the present time a single, universally accepted tire rolling resistance measurement method is not available. Current practices measure rolling resistance while the tire operated at steady state conditions which are a typical of actual tire use. Emission Control Technology Division is concerned that tires ranked according to typical steady state practices perform differently when operated according to current emissions and fuel economy (transient) tests or in real life. This study was conducted to determine the difference in tire rolling resistance rankings from steady state and transient testing. GRA

MATERIEL TESTING IN THE TROPICS
Apr. 1979 274 p refs
(AD-A072434; USATTC-790401) Avail: NTIS HC A12/MF A01 CSCL 14/2

Practically every materiel development effort and subsequent procurement of materiel for Army use must undergo developmental testing to ensure that specified performance criteria are met in a variety of climatic categories. It is thus, highly desirable to have ready access to a document that is an update of available information in terms of appropriate environmental descriptions, and their known and perceived effects on man and materiel as an aid in planning and executing effective environmental tests. The objective of Materiel Testing in the Tropics is to meet such needs by periodically updating information pertinent to testing materiel in the humid tropics. The report is a compendium of the US Army's experiences and available literature in testing materiel in the humid tropics, and special investigations conducted by USATTC to better understand the effects of the environment on the performance of man and materiel. Topics include the need for tropic testing, an environmental description of the Panama Canal Zone, degrading environmental factors, tropic degradation of selected materials and materiel, materiel reliability and maintainability, and effects of the jungle on man and materiel. This document should provide valuable information for those who design, evaluate or use equipment in the humid tropics. GRA

BATHTUB AND RELATED FAILURE RATE CHARACTERIZATIONS Interim Report
Ronald E. Glaser Sep. 1978 31 p refs
(Grant AF-AFOSR-3180-77; AF Proj. 2304)
(AD-A072626; TR-8; AFOSR-78-1440TR) Avail: NTIS HC A03/MF A01

Sufficient conditions are obtained which provide that a lifetime density has a bathtub shaped failure rate. Analogous conditions handle increasing, decreasing, and upside-down bathtub shaped failure rates. Application of these results to exponential families of densities is particularly straight forward and effective. Examples are furnished which introduce new bathtub models and illustrate the use of the general results for existing models. Examples involving mixtures are considered. Maximum likelihood estimation for one of the bathtub models is described. GRA

A BAYESIAN NONPARAMETRIC APPROACH TO RELIABILITY
Richard L. Dykstra and Purushottam Laud 10 Jul. 1979 43 p refs
(Contract N00014-78-C-0655)
(AD-A072431; TR-84) Avail: NTIS HC A03/MF A01 CSCL 12/1

It is suggested that problems in a reliability context may be handled by a Bayesian non-parametric approach. A stochastic process is defined whose sample paths may be assumed to be either increasing hazard rates or decreasing hazard rates by properly choosing the parameter functions of the process. The posterior distribution of the hazard rates are derived for both exact and censored data. Bayes estimates of hazard rates, c.d.f.'s, densities, and means, are found under squared error type loss functions. Some simulation is done and estimates graphed to better understand the estimators. Finally, estimates of the c.d.f. from some data in a paper by Kaplan and Meier are constructed. GRA

RENEWAL MODEL OF RELIABILITY FOR SERIES SYSTEMS - REVISITED
Leon H. Herbach, J. Arthur Greenwood (Oceanweather, Inc., White Plains, N. Y.), and Saul B. Blumenthal (Kentucky Univ., Lexington)

29 Jun. 1979 88 p refs
(Contract N00014-77-C-0601; NR Proj. 042-377)
(AD-A072401; POLY/MA-79-3) Avail: NTIS
HC A05/MF A01 CSCL 12/1

The fact that failures follow the exponential distribution is almost universally accepted in reliability analysis. Two reasons are given for this assumption: (1) It is commonly assumed that electronic components do not wear out but are subject to random shocks which may cause failure. If these shocks form a Poisson process the underlying failure distribution is exponential. (2) Sufficiently complex equipment run for a long time (failed components being replaced by good ones) will follow the exponential distribution. These reasons are investigated. GRA

RELIABILITY PREDICTION FOR MECHANICAL SYSTEMS Final Report, 20 Apr. 1976 - 19 Apr. 1979
M. Vernon Johns, Jr. 11 Jul. 1979 10 p refs
(Grant DAAG29-76-G-0213)
(AD-A071835; ARO-13859.3-MX) Avail: NTIS
HC A02/MF A01 CSCL 14/4

Two areas were investigated. A method for producing exact confidence bounds for the reliability of highly reliable series systems is considered. The methods are based on finding suitable orderings of the sample outcome space, and are valid when the probabilities of component failure are small enough for the failure data to be distributed as Poisson random variables. Optimality criteria are invoked to insure that the orderings used produce confidence bounds which are as tight as possible. Tables to facilitate applications were produced. A new class of robust estimators of location were studied. These estimators (called P-estimators) are analogous to Pitman estimators in the same way that M-estimators are analogous to maximum likelihood estimators. Members of this class were evaluated by computer simulation and were found to perform with even higher efficiency than the bisquare M-estimator for both long and short tailed distributions. GRA

ACCELERATED LIFE TESTING: A PRAGMATIC BAYESIAN APPROACH Interim Report
Frank Proschan and Nozer D. Singpurwalla Jul. 1978 24 p refs
(Contract N00014-77-C-0263; AF-AFOSR-2581-74; AF Proj. 2304)
(AD-A072622; FSU-Statistics-M474) Avail: NTIS
HC A02/MF A01 CSCL 12/1

In this paper we propose a model for accelerated life testing which differs from those considered in the past. Our model does not require the usual assumptions about the failure distributions and the acceleration functions. Our approach is Bayesian, and depends on the estimation of ordered failure rate functions at different stress levels. Since our model is nonprametric, and our approach is quite pragmatic, our results should be of use to engineers working on accelerated life tests, and biometricians involved in carcinogenic experiments. A COMPUTATIONAL MODEL FOR THREE-DIMENSIONAL INCOMPRESSIBLE WALL JETS WITH LARGE CROSS FLOW Final Report, 19 Sep. 1977 - 18 Sep. 1978
W. D. Murray, V. Shankar, and N. Malmuth Sep. 1978 117 p refs
(Contract N62269-77-C-0412; RR0230221)
(AD-A071689; SC5129.5FR; NADC-77163-30) Avail: NTIS
HC A06/MF A01 CSCL 20/4

The flow field of three dimensional incompressible wall jets prototypic of thrust augmenting ejectors with large cross flow is solved using a very efficient centered-Euler scheme in an orthogonal curvilinear coordinate system. The computational model treats initial conditions with arbitrary velocity profiles at or downstream of the jet exit. An averaging approach is employed for the first few marching steps to overcome spurious numerical oscillations associated with arbitrary initial profiles. Laminar as well as turbulent wall jets are simulated. Turbulence is introduced using a two layer mixing length model appropriate to curved three-dimensional wall jets. Typical results quantifying jet spreading, jet growth, nominal separation and jet shrink effects due to cross flow are presented. GRA

HC A07/MF A01 CSCL 14/2

This project sought to establish the feasibility of automatic detection and classification of bond line defects in multiple-layer adhesively bonded structures. Bond strength was not the issue in this work; rather, the detection and classification of a bond line flaw per layer into one of three classes- unbond, void, porosity-independent of part geometry was the main objective. Each part was scanned from one flat surface using a 0.5 inch transducer in the pulse-echo mode. A decision was rendered automatically regarding the existence and classification of defects in each layer for each pulse-echo return in an overall scan pattern. Results show that flaws in multiple-layer structures can be found with accuracies of 91% as to defect versus non-defect discrimination, and 92% as to the correct type of defect. In this work, a false-alarm rate of 19% (non-defects called defects) and a false dismissal rate of 2% (defects called non-defects) was obtained. It is believed that the false alarm rate could be greatly reduced by use of multiple-point(contextual) information from contiguous scans. It has been shown that it is feasible and practical to use ultrasound to detect and classify defects and flaws in multiple-layer adhesively bonded structures, regardless of the layers in which they lie. The method is, by design, insensitive to moderate variations in transducer orientation and to construction geometry. The accuracies on a blind evaluation test compare very well with the data used to train the ALN classifier system. GRA

EXPERIMENTAL ELECTRO-THERMAL METHOD FOR NONDESTRUCTIVELY TESTING WELDS IN STAINLESS STEEL PIPES
D. R. Green 19 Jan. 1979 29 p refs Presented at Natl. Am. Soc. for Nondestructive Testing Conf., San Diego, Calif., 2 Mar. 1979
(Contract EY-76-C-14-2170)
(HEDL-SA-1705; Conf-790366-1) Avail: NTIS
HC A03/MF A01

Electrothermal nondestructive testing of welds in austenitic stainless steel pipes is examined. The development of contacts for injecting the electrothermal exciting current into asreceived stainless steel pipe weld specimens without contaminating or damaging the surface is discussed. The electrothermal method's potential applicability to stainless steel welds of the type used in fast flux test facility pipes is investigated. A.W.H.

SYSTEM RELIABILITY AND COMPONENT COSTS. A CORRELATION OF COMPONENT QUALITY, FAILURE RATE, AND REDUNDACY PARAMETERS [SYSTEMPAALIDELIGHED OF KOMPONENTOMKOSTNINGER. BETRAGTNINGER OVER SAMSPILLET MELLEM PAALIDELIGHED OF KOMPONENTOMKOSTNINGER FOR ET ELEKTRONISK SYSTEM. HOVEDPARAMETRENE ER KOMPONENTKVALITET, -BELASTNINGSGRAD OG REDUNDANS]
Joergen Biegel Feb. 1978 34 p refs In DANISH; ENGLISH summary
(ECR-79) Avail: NTIS HC A03/MF A01

System reliability was correlated to component costs using as main parameters the component quality, the component failure rate, and redundancy in order to optimize the relationship. The reliability, costs, and the relationship quality/cost was studied for each of the three parameters. It is concluded that if a short

term period is considered, redundancy shows a better ratio reliability/cost, while at medium and long term, high quality components are preferred. Author (ESA)

COMPARISON OF SOME INSTRUMENTAL VARIABLE METHODS: CONSISTENCY AND ACCURACY ASPECTS
T. Soederstroem and P. Stoica (Inst. Politec. Bucharest). Oct. 1978. 58 p. refs.
(UPTEC-78-88-R) Avail: NTIS HC A04/MF A01

A general analysis of various instrumental variable methods is given. The investigation includes methods for open loop operation as well as methods designed for closed loop operation. The instrumental variables are formed as different combinations of inputs, delayed outputs, filtered inputs, and external set point variations. Comparison is also made with prediction error methods. Necessary conditions as well as sufficient conditions for consistency are explicitly derived and discussed. Some simple counter-examples to general consistency for some common instrumental variable methods are also included: asymptotic accuracy properties are then reviewed. Finally, examples show how the use of filters will influence the covariance matrix of the parameter estimates. Author (ESA)

DEVELOPMENT OF THE STATISTICAL PATTERN RECOGNITION METHODOLOGY AND ITS APPLICATION TO QUALITY CONTROL
Josef Kittler. Sep. 1978. 145 p. refs. Sponsored by Roy. Soc.
(ENST-D-78023) Avail: NTIS HC A07/MF A01

Various aspects of statistical pattern recognition are reviewed. In the area of feature selection, feature set search algorithms for selecting a subset of pattern descriptors from a set of measurements are comparatively studied. Decision making systems are then considered, particularly as regards measurement errors and the subsequent increase in the error probability of the system. In the realm of pattern classification, the problem of designing a pattern recognition system for processing incomplete pattern vectors is discussed. Next, it is shown that the probability distribution of empirical error count estimate is not binomial and a recursive formula for determining this distribution is given. Finally, pattern recognition techniques are applied to the problem of automatic inspection of products by lots. Alternative approaches to acceptance sampling plan design are proposed. Author (ESA)

SOFTWARE AND PROCEDURES FOR STATISTICAL QUALITY CONTROL [LOGICIELS ET PROCEDURES DE CONTROLE STATISTIQUE DE RECEPTION]
L. F. Pau, M. Deglaire, J. Kittler, M. Thongsa, and C. Toghraie. Apr. 1979. 171 p. refs. Partly in FRENCH and ENGLISH.
(Contracts ENST-292261; LCIE-292958)
(ENST-D-79006) Avail: NTIS HC A08/MF A01

A number of acceptance sampling procedures for statistical quality control, most of which involve measurements, together with the software packages developed for the corresponding sampling plan computations are introduced. The procedures include finite lot acceptance sampling by attributes, without or with individual classification errors; acceptance sampling by measurements with two-sided control of the mean; nonparametric sequential control by measurements; Bayesian acceptance sampling of the mean; and statistical control of the percentage defective determined from multivariate measurements on each item in the sample. A complete theoretical description and an example of computer implementation are given for each procedure presented. Author (ESA)

It is known that the type of the system of partial differential equations governing finite elastostatics can change from elliptic to non-elliptic at sufficiently large deformations for certain materials. This introduces the possibility that the elastostatic field may exhibit certain discontinuities. In this paper we illustrate the occurrence of elastostatic fields with discontinuous deformation gradients in a physical problem. The body is assumed to be composed of a material which belongs to a particular class of isotropic, incompressible, elastic materials which allow for a loss of ellipticity. It is shown that no solution which is smooth in the classical sense exists to this problem for certain ranges of the applied loading. Next, we admit solutions involving elastostatic shocks into the discussion and find that the problem may then be solved completely. When this is done, however, there results a lack of uniqueness of solutions to the boundary-value problem. In order to resolve this non-uniqueness, the dissipativity and stability of the solutions are investigated. GRA

HC A11/MF A01 CSCL 20/11

A hybrid stress multilayer warping quadrilateral element with a traction-free edge (TFQE), based on the Principle of Modified Complementary Energy, has been developed for efficient finite element modeling and analysis at and near free edges. The assumed stress distributions in the element were selected so as to satisfy the basic equations of equilibrium; sufficient detail was implemented throughout each layer of each element to model the steep boundary layer stress gradients, including the important interlaminar stresses. The interlayer stress continuity and traction-free conditions at the free edge are satisfied exactly; the resulting stress distribution was examined for consistency as required by 3-dimensional stress functions. The stress assumption includes no singularity. The traction-free edge is allowed to warp freely. GRA

LARGE DEFORMATION ELASTIC-PLASTIC BUCKLING ANALYSIS OF SPHERICAL CAPS WITH INITIAL IMPERFECTIONS
Robert Kao. May 1979. 53 p. refs.
(Contract N00014-75-C-09446)
(AD-A071480) Avail: NTIS HC A04/MF A01 CSCL 20/11

Large deformation elastic-plastic buckling loads are obtained for axisymmetric spherical caps with initial imperfections. The problem formulation is based on equilibrium equations in which the plastic deformation is taken as effective plastic loads. Plasticity theory is derived from von Mises initial yield condition and Prager-Ziegler kinematic hardening rule. Results show that both initial imperfection and plastic deformation have the same effect of reducing buckling loads, and that the influence of plastic yielding diminishes as the magnitude of imperfections increases. Avail: NTIS HC A11/MF A01 CSCL 20/11

An exploratory research program has been conducted to systematically evaluate the effects of biaxial stress ratio on constant amplitude and variable amplitude fatigue crack growth rates. A series of experiments and analyses have been carried out on the cyclic crack growth behavior of center-cracked cruciform specimens under various biaxial loading conditions. The results may be summarized as follows. Cracks will grow straight in a biaxial stress field when the stress component parallel to the crack is equal to or smaller than the stress component normal to the crack. Elastic K factors are obtainable for both straight and curved cracks and are adequate for correlating the biaxial growth rate data. At a given stress intensity level, the constant

amplitude crack growth rates are the same in all the biaxial loading conditions. In out-of-phase loading conditions, the crack growth rate and crack growth directions are the same as those in the in-phase loading conditions. Crack tip plastic zone size variations with biaxial ratio appeared to have no effect on constant-amplitude crack growth rate. As for the variable amplitude tests, it is very evident that cracks grow faster at positive biaxial stress states, but slower at negative biaxial loading conditions. GRA

NONLINEAR DYNAMIC BUCKLING OF SPHERICAL CAPS WITH INITIAL IMPERFECTIONS
Robert Kao, Jun. 1979, 53 p. refs
(Contract N00014-75-C-0946)
(AD-A071450) Avail: NTIS HC A04/MF A01 CSCL 20/11

A finite difference method is developed for large deformation elastic-plastic dynamic buckling analysis of imperfect spherical caps. The problem formulation is based on governing equations of motion, treating plastic deformation as effective plastic loads. Plasticity theory is derived from von Mises yield condition and Prager-Ziegler kinematic hardening rule which predicts an ideal Bauschinger effect. Results indicate that dynamic effect has the influence of reducing load carrying capacity of perfect spherical caps, however, its influence on imperfect caps depends on the magnitude of initial imperfections. STRESS-RUPTURE LIFE OF KEVLAR EPOXY SPHERICAL PRESSURE VESSELS
R. E. Barlow, R. H. Toland, and T. Freeman, 23 Feb. 1979, 62 p. refs
(Contract W-7405-eng-48)
(UCID-17755-Pt.3) Avail: NTIS HC A04/MF A01

This study of stress rupture has two objectives: to generate baseline data on vessel life under pressure and to apply statistical reliability theory to vessel and strand data in order to predict reliability at given stress levels. The improved life prediction methods useful in the analysis of life data are described. These methods are applied to two sets of data, i.e., the extensive Kevlar/epoxy strand data and the current Kevlar/epoxy spherical pressure vessel data. Of principal importance is the observation that the hazard rates for both data sets are time-dependent at low stress levels; as a result, the exponential lifetime distribution is not valid. Plans are discussed for accelerated life tests of pre-production units, methods for choosing sample sizes, and in-service replacement policies. DOE

SIMPLIFIED INELASTIC ANALYSIS IN HELICAL COIL HEAT EXCHANGER DESIGN
C. E. Richard, Nov. 1978, 7 p. refs. Presented at 3d US Natl. Congr. on Pressure Vessels and Piping, San Francisco, Calif., 25 Jun. 1979
(Contract EY-76-C-03-0167-065)
(GA-A-15188; Conf-790615-5) Avail: NTIS HC A02/MF A01

A simplified inelastic analysis of helical coil tubing for high-temperature applications is described. Elastically calculated operating stresses are compared with inelastic estimates of allowable cyclic creep/fatigue stresses. The technique of simplifying and analyzing the operating cycles to determine acceptable creep damage levels has general application. The allowable stresses represent the greatest uncertainty in the method, and tests are required to improve their accuracy. A method of utilizing short-time test data to determine allowable stresses for reactor lifetimes of 30 to 40 years is proposed. DOE

RESPONSE OF A DOUBLE TUBE SHEET STRUCTURE TO HYDRAULIC PRESSURE TRANSIENTS
W. F. Yau, 1979, 15 p. refs. Presented at 3d US Natl. Congr. on Pressure Vessels and Piping, San Francisco, Calif., 25 Jun. 1979
(Contract EY-76-C-09-0001)
(DP-MS-78-73) Avail: NTIS HC A02/MF A01

A general procedure was developed to analyze complex tubesheet structures under dynamic loading conditions. The top shield of a Savannah River Plant production reactor is a stainless steel box structure perforated by tubular conduits. It supports the hanging fuel assemblies and the weight of the reactor superstructure. During normal reactor operation the top shield and the fuel assemblies are submerged in water coolant. For a postulated transient induced by a loss-of-coolant, a loading profile was constructed that considered (1) reduction of buoyancy, (2) rapid pressure changes due to generation and condensation of steam, and (3) vacuum force on one side following condensation. Dynamic responses to such a loading are analytically represented by linear combinations of natural models that satisfy a fourth-order equation of motion. Localized stress magnification in the tube sheets of the structure is determined according to the theory of perforated plates. DOE

SPECIMEN SIZE CONSIDERATIONS IN FATIGUE CRACK GROWTH RATE TESTING
L. A. James, Dec. 1978, 34 p. refs
(Contract EY-76-C-14-2170)
(HEDL-TME-78-99) Avail: NTIS HC A03/MF A01

The effect of specimen size upon the fatigue-crack growth behavior of annealed AISI Type 304 stainless steel was studied at two stress ratios at an elevated temperature. The resulting data were examined in the light of the present ASTM size criterion (based upon monotonic yield strength) as well as a proposed criterion based upon the material flow strength. The flow stress criterion is considerably less restrictive than the present ASTM

Criterion, and is entirely appropriate for strain-hardening materials such as the austenitic stainless steels. DOE

FLIGHT SIMULATION FATIGUE CRACK PROPAGATION EVALUATION OF CANDIDATE LOWER WING SKIN MATERIALS WITH PARTICULAR CONSIDERATION OF SPECTRUM TRUNCATION
R. J. H. Wanhill 15 Jan. 1979 34 p refs
(Contract NIVR-1806)
(NLR-TR-77092-U) Avail: NTIS HC A03/MF A01

Flight simulation fatigue crack propagation tests were carried out on 2024-T3, 7475-T761, and mill annealed Ti-6Al-4V sheet in thicknesses up to 3 mm. These materials are representative of transport aircraft lower wing skin stiffened panels of end load capacities 1.5 and 3 MN/m. Results show that the performance of 2024-T3 is much superior, owing mainly to greater retardation of crack growth after severe flights. The effect of load truncation is also greater for 2024-T3. The significance of the results in the choice of advanced structural concepts and materials as well as in the choice of truncation level is discussed. A recommendation for further investigation is given. Author (ESA)

HIGHER ORDER TAPERED BEAM FINITE ELEMENTS FOR VIBRATION ANALYSIS
C. W. S. To May 1978 51 p refs Sponsored by UK Min. of Defence
(ISVR-TR-99) Avail: NTIS HC A04/MF A01

Explicit expressions for mass and stiffness matrices of two higher tapered beam elements for vibration analysis are presented. One has three degrees of freedom per node and the other has four degrees of freedom per node. The four degrees of freedom of the latter element are the displacement, slope, curvature, and gradient of curvature. The explicit element mass and stiffness matrices eliminate the loss of computer time and round-off errors associated with the extensive matrix operations used in the numerical evaluation of these expressions. Comparisons with results in the literature concerning tapered cantilever beam structures with or without an end mass and its rotary inertia are made. Results show that the higher order tapered beam elements are superior to the lower order one in that they offer more realistic representation of the curvature and loading history of the beam element. Author (ESA)

FORCE AND MOMENT IMPEDANCE OF INFINITE PLATES
Sten Ljunggren Stockholm Swed. Council for Bldg. Res. 1978 176 p refs
(Grant SWEDCBR-730645-7)
(D3-1978; ISBN-91-540-2824-8) Avail: NTIS HC A09/MF A01; Swed. Council for Bldg. Res., Stockholm Skr 45

The mechanical excitation of an infinite plate is described in terms of impedances. Excitations by a force perpendicular to the plate and by a moment with its axis in the plane of the plate applied over an indenter with finite dimensions are treated. Analysis through two-dimensional and three-dimensional bending wave theory was used to describe plate reaction. Exact solutions in closed form for a stiff indenter with a circular area of contact were obtained. Approximate expressions were derived for the case of a rectangular area of contact. Analysis of plate reaction with three-dimensional theory shows that an applied force or moment causes a bending wave and also a longitudinal wave as well as near fields. With three-dimensional theory the case of a small indenter on a thick plate is studied in particular. Author (ESA)

AN IMPLICIT COMPACT FOURTH-ORDER ALGORITHM FOR SOLVING THE SHALLOW-WATER EQUATIONS IN CONSERVATION-LAW FORM
I. M. Navon and H. A. Riphagen Jan. 1979 64 p refs
(CSIR-TWISK-57) Avail: NTIS HC A04/MF A01
An alternating direction implicit finite difference scheme is developed for solving the nonlinear shallow water equations in conservation law form. The algorithm is second order time accurate, while fourth order compact differencing is implemented in a spatially factored form. Extraneous boundary conditions required by the fourth order method are determined and a fourth order dissipative term is added to the equations to overcome the increased aliasing due to the fourth order method. The numerical integration is performed in a channel corresponding to a middle latitude band. The integral invariants of the equations are well conserved during the integration, ensuring that a realistic nonlinear structure is obtained. K.L.

AN ECONOMIC ANALYSIS OF FIVE SELECTED LANDSAT ASSISTED INFORMATION SYSTEMS IN OREGON Final Report
S. Solomon and K. M. Maher Oct. 1979 30 p refs
(Contract NASw-2800)
(NASA-CR-162434; BCL-OA-TFR-79-5) Avail: NTIS HC A03/MF A01 CSCL 05B
A comparative cost analysis was performed on five LANDSAT-based information systems. In all cases, the LANDSAT system

was found to have cost advantages over its alternative. The information sets generated by LANDSAT and the alternative method are not identical but are comparable in terms of satisfying the needs of the sponsor. The information obtained from the LANDSAT system in some cases is said to lack precision and detail. On the other hand, it was found to be superior in terms of providing information on areas that are inaccessible and unobtainable through conventional means. There is therefore a trade-off between precision and detail, and considerations of costs. The projects examined were concerned with locating irrigation circles in Morrow County; monitoring tansy ragwort infestation; inventoring old growth Douglas fir near Spotted Owl habitats; inventoring vegetation and resources in all state-owned lands; and determining and use for Columbia River water policies.

PROCESSING AND DISPLAY TECHNIQUES FOR MULTISPECTRAL SATELLITE IMAGERY Final Report, 1 Feb. - 30 Sep. 1978
J. A. Roese Apr. 1979 39 p refs
(AD-A072509; NOSC/TR-439) Avail: NTIS HC A03/MF A01 CSCL 09/2

In recent years, the technology area of remote sensing by multispectral satellite sensors has evolved greatly. Imagery obtained by satellite means has been the basis for much work in the areas of environmental studies, resource planning, terrain mapping, weather prediction and military reconnaissance. This program effort has investigated the application of various image processing and display techniques for use with multispectral satellite imagery. Emphasis has been placed on the development and implementation of two-dimensional processing techniques applied in the domain of the original image. Two-dimensional transform domain image processing and display techniques were also adapted for use with satellite imagery. GRA

LAND COVER CLASSIFICATION FROM LANDSAT DATA: PHASE 3 OF A JOINT DOE/NASA DEMONSTRATION Final Report
Richard N. Foreman Mar. 1979 84 p
(AD-A071723; ETL-0175) Avail: NTIS HC A05/MF A01 CSCL 14/5

The Corps of Engineers and NASA's Earth Resources Laboratory conducted a joint demonstration of the production of land cover classification data from LANDSAT data. This report describes Phase III of the demonstration, in which classification maps and data were produced for two Corps of Engineers Districts Wilmington District, an area in the upper Roanoke River basin of Virginia; and Jacksonville District, an area along the route of the Cross Florida Barge Canal. The report includes the Districts: evaluations of the accuracy and applicability of the classifications and cost information for Phase III of the demonstration. The report also includes cost information for the application of interdisciplinary analysis of aerial photography as a means of obtaining land cover and environmental data. LANDSAT data may be cost-effective for identifying and showing the distribution of general types of land cover for large areas, although some land cover types may not be identifiable on a particular LANDSAT scene. Interdisciplinary analysis of aerial photography identifies and explains in a technical report the distribution of land cover. The extra detail of the report and the ability to ensure that specific land cover types are studied may make interdisciplinary analysis of aerial photography cost-effective for limited study areas. STUDY IN REMOTE SENSING FOR LAND USE Final Report, Apr. 1977 - Jun. 1978
Richard D. Shinn and Frank V. Westerlund Air Force Engineering and Services Lab., Tyndall AFB, Fla. Jun. 1979 74 p refs
(Contract F08635-77-C-0278; AF Proj. 2103)
(AD-A071802; AFESC/ESL-TR-79-15) Avail: NTIS HC A04/MF A01 CSCL 14/2

This research tested three methods of obtaining land use information by remote sensing for United States Air Force (USAF) land use planning. The three methods tested were: (1) photo interpretation of aircraft photography; (2) equidensitometric processing of aircraft or LANDSAT imagery; and (3) statistical analysis of LANDSAT digital data. The two sites tested were McChord AFB and Fairchild AFB in Washington State. Using test scenarios of mission realignments it was found that photo interpretation was an accurate and ready means to obtain land use information. GRA

DETECTION OF ARCTIC WATER SUPPLIES WITH GEOPHYSICAL TECHNIQUES
S. A. Arcone, A. J. Delaney, and P. V. Sellmann Jun. 1979 37 p refs
(DA Proj. 4A7-62730-AT-42)
(AD-A072157; CRREL-79-15) Avail: NTIS HC A03/MF A01 CSCL 13/2

This report discusses the application of several modern geophysical techniques to groundwater exploration in areas in permafrost. These methods utilize the principles of magnetic induction and radiowave surface impedance in the 10- to 400-kHz band, the techniques of impulse and side-looking radar in the 50- to 10,000-MHz band, and also some optical techniques using imagery obtained from a satellite. Low frequency case studies demonstrate the use of the techniques for detecting free water under an ice cover in shallow, almost completely frozen lake basins, and thaw zones within lake beds, stream channels, and in permafrost in general. The radar studies demonstrate the use of these techniques for determining depth of free water and ice cover thickness on lakes and rivers. GRA

HEURISTICS FOR KNOWLEDGE ACQUISITION FROM MAPS
Perry W. Thorndyke Jul. 1979 40 p refs
(Contract N00014-78-C-0042)
(AD-A073126; RAND/N-1193-ONR) Avail: NTIS HC A03/MF A01 CSCL 08/2

Acquiring knowledge from a map depends upon procedures for focusing attention, encoding information, and integrating diverse knowledge. This paper describes the heuristics people use to study and learn maps. Verbal protocols obtained from eight subjects suggested four categories of procedures that were invoked during learning: attention, encoding, evaluation, and control. The use of certain heuristics in each category was highly predictive of learning success. Good learners differed from poor learners in their ability to encode spatial information, to evaluate their learning progress, and to focus their attention in accordance

with a learning plan. Many of the successful heuristics appear to be readily trainable. GRA

A COVARIANCE APPROXIMATION PROCEDURE
Hans Suenkel. Hanscom AFB, Mass. AFGL. Mar. 1979. 66 p. refs.
(Contract F19628-79-C-0075; AF Proj. 7600)
(AD-A072853; DGS-286; AFGL-TR-79-0075; SR-1) Avail: NTIS. HC A04/MF A01. CSCL 08/5

The steadily increasing stream of geodetic data primarily provided by automatized measurement techniques calls for a data processing method which is both simple and fast. The simplicity of least-squares collocation can hardly be surpassed, however, the processing speed, which depends on covariance calculation procedure and matrix inversion algorithms used, can be improved considerably by the feaster covariance computation procedure presented in this report. The method is basically a differentiation interpolation procedure applied to a smooth function interpolating on a regular rectangular grid of exact covariances. Once this covariance network has been generated, the covariance approximation procedure, called COVAPP, is able to provide covariance expressions of second and lower order derivatives of the disturbing potential about ten times faster than existing methods. The approximation error can be kept as small as we please by choosing an appropriately small grid spacing. A FORTRAN IV program listing together with sample inputs and outputs are included in the report. GRA

STUDY OF TEMPERATURE/MOISTURE RETRIEVAL CAPABILITIES OF DMSP/SSH SENSOR CHANNELS Final Report, 22 Aug. 1977 - 22 Aug. 1978
Alexander S. Zachor. 25 Sep. 1978. 149 p. refs.
(Contract F19628-77-C-0184; AF Proj. 7670)
(AD-A073144; HONEYWELL-7809-4; AFGL-TR-78-0279) Avail: NTIS. HC A07/MF A01. CSCL 17/5

A number of retrieval algorithms were examined for efficacy in inferring atmospheric temperature and humidity structure from upwelling earth-atmospheric radiances measured in the sensing bands of DMSP/SSH. Inversions of synthetic radiances for cloud-free conditions were performed to determine the limits on retrieval information. It is shown that the CO2 channels yield fairly accurate temperature retrievals, especially when statistical data are used in constructing a guess profile and in regularizing the solutions. Maximum errors below the 70 mb pressure level are typically 3 to 4 C at middle-to-high latitudes, and 4 to 5 C in the tropics. The analysis used noise-free synthetic radiances, but regularization parameter values were assigned on the basis of measured DMSP noise-equivalent spectral radiances. The humidity retrieval capabilities of the six SSH H2O channels are marginal because three of the channels are redundant, and because the channels are too strongly absorbing to infer low-level moisture except under moderately dry conditions. It was found that substitute window channels near 795 and 900/cm are too opaque to provide an independent determination of total precipitable water, although they are probably good candidates as sounding channels to replace the redundant DMSP. GRA

TERTIARY OIL RECOVERY PROCESSES RESEARCH AT THE UNIVERSITY OF TEXAS Annual Report, Oct. 1977 - Sep. 1978
R. S. Schechter and W. H. Wade. Washington. DOE. Dec. 1978. 61 p. refs.
(Contract EW-78-S-19-0001)
(BETC-0001-1) Avail: NTIS. HC A04/MF A01

Many species of monoisomeric alkyl-substituted benzene sulfonates were synthesized and examined at low concentrations. Interfacial tension in particular was studied. Optimum salinity for high surfactant concentrations was defined as the middle of the 3-phase region. Work on surfactant adsorption was focused on a model that can explain maxima and minima in adsorption curves. A model for diffusion and stranding at the aqueous surfactant-oil interface was applied to spontaneous emulsification and extended to systems that form middle-phase microemulsions. DOE

DETERMINATIONS OF HYDROLOGIC PARAMETERS FOR

GLACIAL TILLS IN CONNECTICUT Final Report
David Huntley and Robert F. Black 30 Jun. 1979 20 p refs
(Contract DI-14-34-0001-7014)
(PB-297578/7; W79-07715; OWRT-A-077-CONN(2)) Avail: NTIS HC A02/MF A01 CSCL 13B

Glacial tills located in the upland areas of the Shetucket and Quinebaug River basins, Connecticut, were evaluated for transmissivity and hydraulic conductivity by performing slug-injection tests on nine, small diameter drilled wells and slug-withdrawal tests on nineteen existing, dug wells. Test data yielded values of horizontal hydraulic conductivity that ranged from 1.0 to 355 gpd/sq ft (0.13 to 14.46 m/day). Laboratory-determined values of horizontal hydraulic conductivity were obtained using specially-constructed permeameters on relatively undisturbed samples of till. Computer-model simulations of waste movement through a till aquifer, have widespread application relative to the design of sanitary landfills and other forms of waste disposal in till and stratified sediments. GRA

EFFECT OF VERTICAL SCALE DISTORTION ON THE TEMPERATURE FIELD OF A THERMAL-HYDRAULIC MODEL
D. P. Michelotti, R. A. Bajura, and S. H. Swartz Nov. 1978 131 p refs
(Contract DI-14-34-0001-6214; OWRT Proj. C-7171(6214)(4))
(PB-297274/3; DPM-RAB/SHS-78-1; RR-9) Avail: NTIS HC A07/MF A01 CSCL 13B

The generation of electricity by pumped storage hydroelectric plants to supplement existing thermal power plant facilities for peak energy supply is discussed and the effects of a vertical scale distortion on the flow and temperature fields of a hydraulic model of a pumped storage reservoir system are assessed. Vertical to horizontal scale ratios of 1:1, 3:1, and 5:1 were considered. The model consisted of a submerged hot water jet discharging into an initially cold isothermal reservoir. The jet discharge geometry was patterned after what was considered to be a typical pumped storage outlet. Results are presented for various jet Froude numbers. GRA

RECONNAISSANCE SURVEY OF THE DISTRIBUTION AND ABUNDANCE OF BENTHIC ORGANISMS IN THE NEW YORK BIGHT APEX 5-14 JUNE 1973 Data Report
John Pearce, John Pearce, Clyde MacKenzie, Janice Caracciolo, and Leslie Rogers Oct. 1978 15 p refs
(PB-297333/7; NOAA-DR-ERL-MESA-41; NOAA-79051402)
Avail: NTIS HC A02/MF A01 CSCL 13B

A reconnaissance cruise to stations within the New York Bight apex provided a baseline to be used in assessing the impacts of contaminants from all sources, particularly ocean dumping, on the sediments in this area. Machine listed data and certain statistical calculations, diversity and equitability concerned with the distribution and abundance of benthic invertebrate organisms found in the New York Bight apex is provided. Data from these samples, when compared with data collected at later dates, will provide a baseline against which seasonal and temporal changes in the Bight may be assessed. GRA

MEDEE 2: A MODEL FOR LONG TERM ENERGY DEMAND EVALUATION
Bruno Lapillonne Nov. 1978 53 p refs
(IIASA-RR-78-17) Avail: Issuing Activity

A simulation model, MEDEE 2, designed to evaluate the long-term energy demand of a country in combination with a scenario description of the main aspects of the country's social, economic, and technological evolution is described. Parameters taken into consideration are end-use total demand by category (e.g., residential space heating, service sector cooling, gasoline for intercity cars)and the potential market (maximum demand that can be technically met) for each final energy form (electricity, coal, gas, solar, oil products, and district heat). The model also calculates useful energy demand in each end-use category for

which several energy forms can be used, thus determining the substitution possibilities is energy use. The scenario description is complemented with technological parameters (e.g., insulation standards, efficiencies, fuel mix), the evolution of which is specified in a way consistent with the macroeconomic assumptions.

(NASA-TP-1564; L-13440) Avail: NTIS HC A04/MF A01 CSCL 10A

The NASA Tech House was designed and constructed at the NASA Langley Research Center, Hampton, Virginia, to demonstrate and evaluate new technology potentially applicable for conservation of energy and resources and for improvements in safety and security in a single-family residence. All technology items, including solar-energy systems and a waste-water-reuse system, were evaluated under actual living conditions for a 1 year period with a family of four living in the house in their normal lifestyle. Results are presented which show overall savings in energy and resources compared with requirements for a defined similar conventional house under the same conditions. General operational experience and performance data are also included for all the various items and systems of technology incorporated into the house design. Author

Solar cells from RTR ribbons, EFG (RF and RH) ribbons, dendritic webs, Silso wafers, cast silicon by HEM, silicon on ceramic, and continuous Czochralski ingots were fabricated using a standard process typical of those used currently in the silicon solar cell industry. Back surface field (BSF) processing and other process modifications were included to give preliminary indications of possible improved performance. The parameters measured included open circuit voltage, short circuit current, curve fill factor, and conversion efficiency (all taken under AM0 illumination). Also measured for typical cells were spectral response, dark I-V characteristics, minority carrier diffusion length, and photoresponse by fine light spot scanning. the results were compared to the properties of cells made from conventional single crystalline Czochralski silicon with an emphasis on statistical evaluation. Limited efforts were made to identify growth defects which will influence solar cell performance. A.R.H.

WIND LOADS ON FLAT PLATE PHOTOVOLTAIC ARRAY FIELDS Final Report
Ronald Miller and Donald Zimmerman Sep. 1979 112 p refs
Prepared for JPL and DOE

(Contract JPL-954833)
(NASA-CR-162424; DOE/JPL-954833-79/2) Avail: NTIS HC A06/MF A01 CSCL 10A

The aerodynamic forces resulting from winds acting on flat plate photovoltaic arrays were investigated. Local pressure distributions and total aerodynamic forces on the arrays are shown. Design loads are presented to cover the conditions of array angles relative to the ground from 20 deg to 60 deg, variable array spacings, a ground clearance gap up to 1.2 m (4 ft) and array slant heights of 2.4 m (8 ft) and 4.8 m (16 ft). Several means of alleviating the wind loads on the arrays are detailed. The expected reduction of the steady state wind velocity with the use of fences as a load alleviation device are indicated to be in excess of a factor of three for some conditions. This yields steady state wind load reductions as much as a factor of ten compared to the load incurred if no fence is used to protect the arrays. This steady state wind load reduction is offset by the increase in turbulence due to the fence but still an overall load reduction of 2.5 can be realized. Other load alleviation devices suggested are the installation of air gaps in the arrays, blocking the flow under the arrays and rounding the edges of the array. A wind tunnel test plan to supplement the theoretical study and to evaluate the load alleviation devices is outlined.

ELECTRON RADIATION DAMAGE OF (AlGa) As-GaAs SOLAR CELLS. Final Report, 25 Apr. 1978 - 24 Apr. 1979
R. Loo, G. S. Kamath, and R. Knechtli. Oct. 1979. 71 p. refs. Prepared for JPL.
(Contract NAS7-100)
(NASA-CR-162425) Avail: NTIS HC A04/MF A01 CSCL 10A

Solar cells (2 cm by 2 cm (AlGa) As-GaAs cells) were fabricated and then subjected to irradiation at normal incidence by electrons. The influence of junction depth and n-type buffer layer doping level on the cell's resistance to radiation damage was investigated. The study shows that (1) a 0.3 micrometer deep junction results in lower damage to the cells than does a 0.5 micrometer junction, and (2) lowering the n buffer layer doping density does not improve the radiation resistance of the cell. Rather, lowering the doping density decreases the solar cell's open circuit voltage. Some preliminary thermal annealing experiments in vacuum were performed on the (AlGa)As-GaAs solar cells damaged by 1-MeV electron irradiation. The results show that cell performance can be expected to partially recover at 200 C with more rapid and complete recovery occurring at higher temperature. For a 0.5hr anneal at 400 C, 90% of the initial power is recovered. The characteristics of the (AlGa)As-GaAs cells both before and after irradiation are described.

ON-LINE TESTS OF ORGANIC ADDITIVES FOR THE INHIBITION OF THE PRECIPITATION OF SILICA FROM HYPERSALINE GEOTHERMAL BRINE. 2: TESTS OF NITROGEN-CONTAINING COMPOUNDS, SILANES, AND ADDITIONAL ETHOXYLATED COMPOUNDS
J. E. Harrar, F. E. Locke, C. H. Otto, Jr., L. E. Lorensen, and W. P. Frey. 1 Jun. 1979. 24 p. refs.
(Contract W-7405-eng-48)
(UCID-18195) Avail: NTIS HC A02/MF A01

Several new classes of organic compounds were screened as potential geothermal scale control agents by examining their effect on the precipitation of silica from Magmamax No. 1 brine. The substances were tested using the Brine Treatment Test System at the Niland, California, Test Site. Solutions of the test substances were injected into flowing brine at 210 C, the brine was flashed to 125 C, and then the kinetics of solids and silica precipitation from effluent brine held at 90 C were measured. Three new types of compounds were shown to have activity as precipitation inhibitors: polyethylene imines, polyethyloxazalines, and quaternary ammonium compounds containing polyoxyethylene. Among the latter, Ethoquad 18/24, which is methylpolyoxyethylene(15) octadecylammonium chloride, is the leading candidate antiscalant. It is a more powerful inhibitor of silica precipitation than the pure polyoxyethylene polymers, and it apparently has no high temperature solubility limitations. Measurements were made of the concentrations of monomeric silica and the effect of addition of inhibitor at various points in the Brine Treatment Test System.

(AD-A072358; DELET-TR-78-0563-2) Avail: NTIS HC A04/MF A01 CSCL 10/3

This report describes the Li/SOCl2 inorganic electrolyte system, which is the highest energy density system known to date. It consists of a Li anode, a carbon cathode and SOCl2 which acts both as a solvent and as a cathode active material. The electrolyte salt that has been used most extensively is LiAlCl4, but salts such as Li2B10Cl10 and Li2(AlCl3)2 have also been used successfully in this system for improving the shelf life characteristics. The main objective of this program is to develop high rate Li/SOCl2 cells and batteries for portable applications of the U. S. Army. The cells and batteries must deliver higher energy densities than are presently available and must be safe to handle under U. S. Army field conditions.

HEAT PUMP CENTERED INTEGRATED COMMUNITY ENERGY SYSTEMS: SYSTEM DEVELOPMENT Interim Report
Feb. 1979 105 p refs
(Contract W-31-109-eng-38)
(ANL/ICES-TM-27) Avail: NTIS HC A06/MF A01

Heat pump centered intergrated community energy systems (HP-ICES) are energy systems for communities which provide heating, cooling, and/or other energy services through the use of heat pumps. Since heat pumps primarily transfer energy from existing and otherwise probably unused sources, rather than convert it from electrical or chemical to thermal form, HP-ICES are viewed as having significant potential for energy conservation. The System Development phase of the HP-ICES project is described and the results are reported. DOE

N80-11572# Dubin-Bloome Associates, New York.
HEAT PUMP CENTERED INTEGRATED COMMUNITY ENERGY SYSTEMS: SYSTEMS DEVELOPMENT, DUBIN-BLOOME ASSOCIATES

HIGH COP HEAT PUMP SYSTEM, PHASE 1, RESULTS
Apr. 1979 151 p
(Contract EC-77-C-01-5056)
(HCP/M5056-01, TR-1) Avail: NTIS HC A08/MF A01

The High COP Heat Pump System described is a device for recovering heat or energy usually lost in process streams by rejection to once-through cooling systems. The acetone recovers process makes use of river water to cool process streams, with the river water taking on heat in the heat exchange process. Heat or energy is thereby rejected from the process stream and is not recovered for reuse. The MTI Heat Pump System allows reuse of this energy. The estimated cost of a production Heat Pump System is $625,000 plus installation. The system can deliver 20 million BTU's per hour of latent steam energy. Based on a steam cost of $1.89 million BTU's for natural gas, the system being in service for 7884 hours per year (90% in-service rate), a 20% investment tax credit and installation costs at 50% of hardware costs; the discounted cash flow rate of return is 29.5%. Breakeven points are 2.6, 3.6, and 4 years for oil, gas and coal respectively. Details are provided about the Heat Pump System operation in the section entitled Process Description. Cycle Optimization is discussed, providing insight on the technique of determining the optimum system configuration. System Sensitivity shows how relatively little the output varies with changes in turbine and compressor efficiencies. Details of System Design are given, in which design objectives, applicable codes, working fluid, general arrangement, and component design features are discussed. Installation at the host site is analyzed, as is System Cost. Under Environmental Effects, it is shown that the Heat Pump System will increase the quality of the environment. DOE

HEAT PUMP CENTERED INTEGRATED COMMUNITY ENERGY SYSTEMS: SYSTEM DEVELOPMENT Interim Report
D. W. Wade, B. C. Trammel, B. S. Dixit, D. C. McCurry (McCurry and Assoc., Atlanta), and B. A. Rindt (McCurry and Assoc., Atlanta) Feb. 1979 201 p refs Prepared for Argonne National Lab.
(Contract W-31-109-eng-38)
(ANL-ICES-TM-28) Avail: NTIS HC A10/MF A01

The heat pump - wastewater heat recovery (HP-WHR) scheme is one approach to heat pump centered integrated community energy systems that proposes to reclaim low grade thermal energy from a community's wastewater effluent. The concept of an HP-WHR system is developed, the potential performance and economics of such a system is evaluated and the potential for application is examined. A thermodynamic performance analysis of a hypothetical system projects an overall system coefficient of performance of from 2.181 to 2.264 for wastewater temperatures varying from 50 F to 80 F. Primary energy source savings from the implementation of this system is projected to be 5.014 QUADS, or the energy equivalent of 687 millions tons of coal, from 1980 to the year 2000. Economic analysis shows the HP-WHR scheme to be cost competitive, on the basis of a net present value life cycle cost comparison, with conventional residential and light commercial systems. DOE

HEAT PUMP CENTERED INTEGRATED COMMUNITY ENERGY SYSTEM; SYSTEM DEVELOPMENT Interim Report
Mar. 1979 153 p refs Prepared for Argonne National Lab.
(Contract W-31-109-eng-38)
(ANL/ICES-TM-31) Avail: NTIS HC A08/MF A01

Heat Pump Centered-Integrated Community Energy System (HP-ICES), based on the use of privately owned heat pumps in each building within a community, is described. The heat pumps will provide all of the space heating, space cooling and domestic hot water needs. All of the energy required is provided by electrical power, thereby eliminating a community's dependence on gas or oil supplies. The electrical power can be generated using any available fuel. The heat pumps will operate in both air and water source modes, deriving the best performance advantages of both. The water source, provided to the users by a community-owned distribution system dedicated to HP-ICES use, is closed-loop. During most of the winter heating season, the heat pumps will operate from the community water source, extracting the latent heat of the water and thereby producing ice. This ice will be pumped back into the same community main from which the water was originally withdrawn. Thus, the community water main becomes, in addition to a simple water supply, an energy slush fund from which individual users can draw as required. The resdences draw off water and return ice; the commercial buildings draw off chilled water and/or ice and return warmed water. DOE

TRANSFER OF ENERGY CONSERVATION TECHNOLOGY TO INDUSTRY. A PRELIMINARY SURVEY OF EXISTING MECHANISMS
Carolyn S. Colsher and Allan R. Evans Sep. 1978 55 p refs
(Contract W-31-109-eng-38)
(ANL/EES-TM-28) Avail: NTIS HC A04/MF A01

To ascertain the current level of interest, capabilities, and involvement in the dissemination of information on industrial energy conservation, a survey was conducted. Based upon 150 responses from major groups, it was found that although form and level of activity varied widely, the most frequently used communications channels were workshops, seminars, conferences, energy audits, energy committees, and distribution of literature. Among the areas cited as needing improvement was (1) awareness and acquisition of literature and (2) availability of industry or process specific technical manuals for plant managers or engineers. The most successful government/industry interfaces were felt to be workshops held cooperatively with trade associations, programs to encourage sharing of generic conservation techniques between firms, and published literature. IMPLEMENTING ENERGY CONSERVATION STRATEGIES IN ENERGY MATERIALS TRANSPORT: U. S. DEPARTMENT OF ENERGY AND OTHER GOVERNMENT AGENCY POLICY-MAKING DECISIONS
K. M. Bertram Nov. 1978 62 p refs
(Contract W-31-109-eng-38)
(ANL/EES-TM-32) Avail: NTIS HC A04/MF A01

The policy-making channels within Federal agencies for the strategy implementation efforts of U. S. Department of Energy conservation projects are defined. Government agency policy-making mechanisms are reviewed and analyzed. Emphasis was placed upon relevant Federal agencies and summary treatment given other federal, state, and local agencies. Brief case studies were made of states and localities which have significant effects upon energy materials transport systems. The main findings of the report are that two primary channels exist for effecting this project's policy-oriented strategies: inputs to legislation and inducement of regulatory involvements. DOE

DESIGN CONSIDERATIONS FOR A PROPOSED PASSIVE VACUUM SOLAR ANNULAR RECEIVER
T. D. Harrison, G. N. Bond, and A. C. Ratzel Apr. 1979 43 p refs
(Contract EY-76-C-04-0789)
(SAND-78-0982) Avail: NTIS HC A03/MF A01

Testing of an east-west 90 deg parabolic trough collector revealed problems associated with achieving and maintaining annulus pressures below 1 Pa along with other receiver problems and maintaining annulus pressures below 1 Pa along with other receiver problems (black chrome degradation) that reduced the performance of the collector. Analyses of the test results show that a vacuum in the annulus of the receiver assembly can significantly increase the amount of energy collected daily by at least 13% depending upon the reflector trough and tracking capabilities of the collector design. The problem associated with the current receiver are described and a modified passive vacuum design intended to correct the problems is presented. Test results will determine whether the value of the additional energy collected is greater than the cost of achieving the vacuum. DOE

UNITED STATES/CANADA ELECTRICITY EXCHANGES
Feb. 1979 233 p refs Prepared in cooperation with Department of Energy, Mines and Resources, Ottawa, Ontario
(DOE/ERA-0053) Avail: NTIS HC A11/MF A01

The United States and Canada have been cooperating in all areas of energy exchange for many years. Electrical energy was chosen to be the focus because substantial means for exchanges offer benefits that have not yet been fully exploited. There may be some bilateral benefits from additional interconnections because of the buffers which they represent against domestic imbalances. After the history of the electricity exchanges between the two countries is reviewed, opportunities and incentives and obstacles and constraints are discussed. The procedures to resolve obstacles and minimize constraints are discussed. DOE

CASE STUDY OF THE BROWNELL LOW ENERGY REQUIREMENT HOUSE, THERMAL STORAGE ANALYSIS
R. Jones, R. Krajewski, and G. Dennehy 1979 15 p refs Presented at Solar Energy Storage Options Workshop, San Antonia, Tex., 18 Mar. 1979
(Contract EY-C-02-0016)
(BNL-25832; Conf-790328-6) Avail: NTIS HC A02/MF A01

An analysis is made of the thermal storage performance of an innovative residence built in the Adirondacks area of New York State by Adirondack Alternate Energy. A detailed case study report of this residence will be issued shortly by Brookhaven National Laboratory. Effective integral thermal storage provided by the exposed interior building structure, serves to keep interior temperature swings within acceptable limits. Additional remote thermal storage, is provided in the form of a large sand bed, with air ducts located below the basement floor slab. The building was instrumented and tested by BNL staff during January, February, and March of 1978, with technical assistance provided by the builder's staff. The thermal storage effects of the remote sand bed and the building materials available for thermal storage within the structure are quantified. The thermal storage performance of the exposed building materials was found to be quite effective. The existing sand bed, however, has a diurnal storage utilization factor of only 8%. Two hypothetical designs are shown which improve the storage bed utilization to 38% for a sand bed with an enhanced duct system 61% for a ducted concrete slab. Other comparisons of these storage beds are also made, including a comparison with a rock bed storage system. DOE

REGIONAL REFERENCE ENERGY SYSTEMS: ELECTRIC UTILITY APPLICATIONS
A. Hermelee Jan. 1979 106 p refs
(Contract EY-76-C-02-0016)
(BNL-50962) Avail: NTIS HC A06/MF A01

The Reference Energy Systems (RES) projection methodology is reformulated in order to apply the format to an electric utility region. The system's approach, incorporating all resources, technologies and uses of energy, allows a utility to assess the impact of alternate technologies and policies across the entire energy system. Demand patterns for 25 end-use demand categories within the residential, commercial, industrial, and transportation sectors are developed for a base case scenario representing reasonable energy use patterns derived in a consistent manner by applying engineering techniques to the best available information. The impact of a new technology in terms of resource consumption is evaluated by modifying the energy flow paths to incorporate the new technology. Alternate paths through the network reflect the substitutability of resources and technologies for one another. DOE

DOE HEAT PUMP CENTERED INTEGRATED COMMUNITY ENERGY SYSTEMS PROJECT
J. M. Calm 1979 17 p refs Presented at Heat Pump Technol., Inform. Exchange Meeting, Gaithersburg, Md., 7 Mar. 1979
(Contract W-31-109-eng-38)
(CONF-790362-1) Avail: NTIS HC A02/MF A01

The development of centralized, distributed, and cascaded heat pump centered integrated community energy systems using both waste and natural heat is discussed. These systems show promise for cost reduction, increased reliability, and avoidance of adverse environmental effects in providing process and space heating and cooling. K.L.

N80-11587# Argonne National Lab., Ill.
WORLD ENERGY DATA SYSTEM (WENDS)
W. E. Lareau 1979 45 p refs Presented at the Spring Meeting of the Assoc. of System 2000 Users for Tech. Exchange (ASTUTE), Austin, Tex., 3 Apr. 1979
(Contract W-31-109-eng-38)
(CONF-790461-2) Avail: NTIS HC A03/MF A01

The storage of preformatted textual information in a completely user oriented data base, the World Energy Data System, is discussed. The system allows qualified users online access to nonclassfied management level data on worldwide energy technology and research and development activities. WENDS transmits up-to-date information on foreign energy technology and research and development programs to DOE program divisions, the Congress, and other U.S. Government officials going abroad. The WENDS concept is described and the method storing and retrieving the textual information is discussed. DOE

GAS GENERATOR RESEARCH AND DEVELOPMENT: BI-GAS PROCESS Interim Report, Jul. 1977 - 30 Jun. 1978
Sep. 1978 254 p refs Prepared in cooperation with Phillips Petroleum Co. Sponsored in part by the American Gas Assoc.
(Contracts EX-76-C-01-1207; EF-77-C-01-1207)
(FE-1207-49; BCR-L-919) Avail: NTIS HC A12/MF A01

Work continued on the evaluation of fluidized-bed methanation catalysts at both the bench-scale and PEDU-scale levels. In addition, assistance has been given in planning, acquisition, and assessment of the BI-GAS pilot plant operation data. Bench-scale studies included six standard life tests to evaluate 22 new fluidized-bed methanation catalysts, and one life test of samples of catalyst from PEDU Test No. 27 to determine, if possible, a reason for the decreased activity of the catalyst during the PEDU test. Of the 22 new catalysts, only one showed sufficiently high activity at normal operating temperatures to justify consideration as a PEDU test candidate; a PEDU-size sample of this catalyst was ordered. A new clear-plastic model of the PEDU methanator was constructed for the purpose of studying heat-transfer characteristics within the methanator. Initial tests agreed substantially with PEDU data and indicated that the axial tube location gave better heat transfer than the nonaxial location. DOE

INCREASED ENERGY FROM BIOMASS: 1985 POSSIBILITIES AND PROBLEM. WORKING PAPERS FOR PLANNERS
1978 202 p From Pacific Northwest Bioconversion Workshop, Portland, Oreg., 24-26 Oct. 1978; Sponsored in cooperation with the Energy Offices of Alaska, Idaho, Montana, Oregon and Washington, U. S. Forest Service and Oregon State Univ.
(RLO-788-5; Conf-7810132) Avail: NTIS HC A10/MF A01

Summaries, together with charts and data in some cases, of the talks given by panelists to the Conference are compiled. The first four sessions examined current agricultural and peat applications with emphasis on wood use. The resource base for agricultural wastes, peat, and wood was evaluated. In the fifth session the barriers and constraints on the use of biomass as an energy source were identified and some possible solutions suggested. The sixth session consisted of work groups on the production of gaseous and liquid fuels, utility applications of biomass and impacts, residential and small scale applications, and biomass supply systems. Extensive summaries were provided of the discussions of each work group; these included recommendations on private and public actions necessary to foster the use of biomass for energy. DOE

DEPARTMENT OF ENERGY FOSSIL ENERGY EQUIPMENT DEVELOPMENT PROGRAMS
J. L. Powell, W. R. Williams (ORNL), T. K. Lau, and H. T. Jones Apr. 1979 13 p refs Presented at AICE Meeting, Houston, Tex., 1 Apr. 1979
(Contract W-7405-eng-26)
(CONF-790405-14) Avail: NTIS HC A02/MF A01

Design, construction, and operation of synthetic fuel processing plants in the near future must consider equipment requirements to make such operations economically feasible and sound. The Department of Energy's approach is to use as much available equipment as practical, to modify and qualify equipment which is not expected to perform acceptably in its standard configuration, and to develop new equipment only if no current capability or acceptable alternative exists. Approaches, philosophy, goals, and implementation of fossil energy equipment development programs are discussed. Some results of a recent survey of industrial coal conversion equipment capabilities are presented as an example of current equipment, state-of-the-art and equipment development needs. DOE

COMPOSITION STABILITY AND DEGRADATION PRODUCTS OF SELECTED MATERIALS FOR SOLAR HEATING AND COOLING
C. Arnold, Jr. and R. E. Trujillo Mar. 1979 36 p refs
(Contract EY-76-C-04-0789)
(SAND-78-0681) Avail: NTIS HC A03/MF A01

The composition, stability and thermal degradation products of a variety of structural plastics, heat transfer fluids, thermal storage media and sealants, which have been proposed for use in solar heating and cooling applications, were either defined generically by analysis or obtained by surveying the literature. This information will be used to aid in the assessment of the environmental impact of these materials. By gas chromatography-mass spectrometry (GCMS), Beta-phenylnaphthylamine, a suspected carcinogen, was tentatively identified as a component in the heat transfer fluid, UCON. In addition, aromatic components which might be toxic were detected in all of the heat transfer fluids that were derived from petroleum sources. By TGA (thermogravimetric analysis), it was found that polysulfide, Neoprene, poly(vinyl chloride) and poly(vinyl fluoride) were the least stable solar heating and cooling materials. In the event of a solar system failure, these materials would be expected to thermally degrade and evolve such toxic substances as H2S, HC1 and HF. Other solar heating and cooling materials were found to be more thermally stable and hence should not outgas if the solar system fails. DOE

STANDBY CONSERVATION PLAN NO. 2: EMERGENCY BUILDING TEMPERATURE RESTRICTIONS. ECONOMIC ANALYSIS
Feb. 1979 39 p refs
(DOE/ERA-0047) Avail: NTIS HC A03/MF A01

The emergency building temperature restrictions plan is

intended to be implemented in the event of a petroleum supply interruption or to satisfy the obligations of the United States under the International Energy Program. The economic impact of the measure was analyzed by assuming that the measure was implemented during 1980-1981 in a hypothetical petroleum shortfall of 15%. The plan is designed to reduce energy consumption by placing restrictions on thermostat settings for heating, cooling, and hot water in commercial, industrial, and public buildings. Specifically, the plan would mandate a maximum thermostat setting of 65 F for space heating, a minimum setting of 80 F for space cooling, and maximum setting of 105 F for hot water. Hotels and motels, hospitals, and areas of buildings where specific temperatures are required to maintain special equipment or supplies are exempt. Also exempt is hot water used for dishwashing and other uses where health codes require higher temperatures for sanitation. Effects of the measure on worker comfort and productivity are discussed in the appendices. DOE

BIOLOGICAL EVALUATION OF DEVICES USED FOR ENTRAINMENT AND IMPINGEMENT LOSSES AT THERMAL POWER PLANTS
G. F. Cada and A. T. Szluha 1978 53 p refs Presented at the Intern. Symp. on the Environ. Effects of Hydraulic Eng. Works, Knoxville, Tenn., 12 Sep. 1978 Sponsored in part by NUREG and EPA
(Contract W-7405-eng-26)
(CONF-7809109-1) Avail: NTIS HC A04/MF A01

A preliminary survey of fish protection devices either in use or proposed for water intake structures was conducted for the purpose of assessing their potential for reducing impingement and entrainment. All the designs examined fit into two basic categories: behavioral screening devices systems and physical screening systems. The behavioral screening devices rely upon the ability of fish to sense artificial stimuli and respond by swimming away from hazardous areas. These systems are of little or no value in protecting planktonic fish eggs, larvae, and disoriented, heat-shocked, or lethargic adult fishes. Many of the physical screening devices, on the other hand, require the impingement of organisms against a screen before they can be removed from the intake system, thus subjecting survival. Some of the designs incorporate both behavioral and physical screening concepts. The design features and status of biological testing is discussed for each device, and an evaluation of their fish protection potential is presented. DOE

OTEC THERMAL RESOURCE REPORT FOR CARIBBEAN SEA PLANT SHIP 13-15 DEGREES N 75-80 DEGREES N
W. A. Wolff May 1979 41 p refs
(Contract ET-78-C-01-2898)
(HCP/T2898) Avail: NTIS HC A03/MF A01

A large and consistent thermal resource which exists in the area between 13-15 deg North latitude and 75-80 deg West longitude, was studied for possible use by a plant ship. The area is primarily in the Colombian Basin of the Caribbean Sea. The average annual delta T (surface temperature minus temperature at depth) for the area at 1000 meters is 22.4 C. At 650 meters, an adequate delta T exists, with no month of the year having a mean delta T less than 19 C. The total variability of temperature at all depths in this Caribbean area is small. Below 1000 meters, the total variation is extremely small. The area has a good mixed layer at all times of the year. It is occasionally exposed to strong winds from hurricanes. Currents generally show the same general pattern throughout the year with a predominant flow toward the west or northwest at average speeds of 40-50 cm/sec. DOE

N80-11600# Ocean Data Systems, Inc., Monterey, Calif.
OTEC THERMAL RESOURCE REPORT FOR WESTERN COAST MEXICO
W. A. Wolff May 1979 44 p refs
(Contract ET-78-C-01-2898)
(HCP/T2898) Avail: NTIS HC A03/MF A01

The site chosen for study off the western coast of Mexico between 20 deg 23 deg North latitude, 105 deg 110 deg West longitude has a temperature difference resource which is more than adequate for potential OTEC use. The annual mean delta to 1000 meters is 20.9 C. An annual mean delta T of 20.0 C is available at 800 meters. The monthly mean delta T for the coldest month of the year is 17.2 C; at 800 meters while there is some variation in the monthly mean temperature difference, even the coldest month is adequate. The mixed layer depth is very shallow throughout the entire year. Storms are a problem for this area between May and November. Low sea and swell predominate throughout the year. The surface currents are generally weak to moderate with some variation in direction during the year. The continental shelf is fairly wide for most of the region making the distance to shore from depths of 1000 meters somewhat large. There is one bay from which deep water can be reached within 5 kilometers. DOE

USER MANUAL FOR GEOCITY: A COMPUTER MODEL FOR GEOTHERMAL DISTRICT HEATING COST ANALYSIS
H. D. Huber, C. L. McDonald, and S. C. Schulte Oct. 1978 200 p refs
(Contract EY-76-C-06-1830)
(PNL-2742) Avail: NTIS HC A09/MF A01

A computer model called GEOCITY was developed to systematically calculate the potential cost of district heating using hydrothermal geothermal resources. GEOCITY combines climate, demographic factors, and heat demand of the city, resource conditions, well drilling costs, design of the distribution system, tax rates, and financial factors into one systematic model. The GEOCITY program provides the flexibility to individually or collectively evaluate the impact of different economic and technical parameters, assumptions, and uncertainties on the cost of providing district heat from a geothermal resource. Both the geothermal reservoir and distribution system are simulated to model the complete district heating system. GEOCITY calculates the unit cost of energy and the unit cost of heat for the district heating system based on the principle that the present worth of the revenues will be equal to the present worth of the expenses including investment return over the economic life of the distribution system. DOE

ANALYSIS OF FINANCIAL PROGRAMS FOR ENERGY CONSERVATION: MARKET SIMULATION (PENETRATION) MODEL
G. S. Maddala, J. W. Milliman, and R. B. Roberts Aug. 1978 273 p refs
(Contract EC-76-C-01-8662)
(HCP/M8662-1) Avail: NTIS HC A12/MF A01

A simulation model was developed to evaluate the effects of Federal financial-incentive programs. Specifically the model was developed for two industries: primary metals and stone, clay, and glass. The model is designed to be a link between existing macro models of the economy and micro engineering models. The model is also designed as a prototype that could be easily adapted to a variety of industries. The model, as currently developed, performs the following major functions: (1) evaluates the impact of different financial incentive programs on the rate of market penetration of energy-saving technologies; (2) estimates the energy saved over-time because of these programs; (3) estimates the change in energy efficiency of the capital stock because of these programs; (4) estimates the value of the energy saved and the cost to the government of the program; and (5) calculates the social benefits and costs of the program. DOE

CONVERSION OF RADIANT ENERGY INTO CHEMICAL ENERGY
G. Calzaferri Nov. 1978 44 p refs Transl. into ENGLISH from Chimia, Switzerland, v. 32, no. 7, Nov. 1978 p 241-253
(UCRL-Trans-11427) Avail: NTIS HC A03/MF A01

The conversion of light into chemical energy as well as the conversion of chemical energy into light leads to exciting speculations and experiments. Reversible photoredox reactions appear to be the most promising chemical system for converting solar energy into chemical or electrochemical energy. Finding selective electrode material in photogalvanic cells is one of the problems to be solved. Selective electrode material for Fe(+3)/sub sq/Fe(+2)/sub sq was found in the thionine/iron system as well as in the iodine/iron system. Attention should now be focused on reversible two or more photon processes at low light intensities

because clevage of water in the visible region cannot be done with one photon. DOE

CHEMICAL ENGINEERING DIVISION BASIC ENERGY SCIENCES RESEARCH. Report, Jul. 1976 - Sep. 1977
1978. 112 p. refs.
(Contract W-31-109-eng-38)
(ANL-78-42) Avail: NTIS. HC A06/MF A01.

Studies in basic energy science covered many different activities, nearly all of which were designed to gain information required for a better understanding of systems important to national needs in energy and environment. Studies of associating gases included measurements of thermal conductivities and basic molecular orbital calculations. Raman spectroscopy and spectrophotometry were used to determine thermodynamic and spectroscopic data on salt vapor complexes. Polarized Raman spectra of As2S3 thin films and vapors were recorded. Halogenation of lanthanide oxides with aluminum chloride allowed the separation of the resultant chloride complexes by vapor transport. Electrochemical titrations were used to obtain the solubility product of iron sulfide in molten LiCl-KCl eutectic. Solubility products of eleven sulfides in the same eutectic mixture were calculated. Galvanostatic techniques were used to study metal deposition/dissolution reactions in molten salts. Activity-coefficients of lithium in lithium-lead alloys were determined electrochemically; phase diagrams of ternary alloys of Li-Al-Mg and Li-Ca-Mg were computed. Thermodynamic studies are being made of the sorption of hydrogen by Li-Al and Li-Pb alloys. DOE

DISAGGREGATING PIES FUEL FORECASTS, VALIDATING PIES TRANSPORTATION MODEL DATA BASE, AND OTHER TECHNICAL SERVICES
15 Sep. 1978. 84 p.
(Contract EC-77-C-01-8578)
(TID-29000) Avail: NTIS. HC A05/MF A01.

Three research tasks concerned with modifications and/or alterations to the PIES (Project Independence Evaluation System) and one auxiliary research task are reported. The first task, a modification to the transportation data base for petroleum refining regions, was necessitated by a proposed change of the present seven refining districts to ten refining districts. Five of the Standard Tables on transportation costs required changes. Tariffs and route descriptions are given in interregional pipeline rates for crude oil and petroleum products. Pipeline tariffs and tanker costs for distribution of Alaskan oil to PIES refining regions are tabulated. In the second task the structure of the coal transportation submodel in PIES was changed by building a simplified transshipment network which makes it possible to easily track coal from the mine to the point of use. The third task is a brief description of natural gas rates and rate making practices in the U.S. The fourth task analyzes differences in actual wholesale prices in various other locations in a region (as opposed to the PIES centroid) with respect to the differences in transportation costs. DOE

MIDTEMPERATURE SOLAR SYSTEMS TEST FACILITY (MSSTF) PROJECT TEST RESULTS: PHASE 4A MSSTF SYSTEM OPERATION
Thomas D. Harrison and William H. McCulloch. Nov. 1978. 53 p. refs.
(Contract EY-76-C-04-0789)
(SAND-78-1088) Avail: NTIS. HC A04/MF A01.

The results of testing the Department of Energy's Midtemperature Solar Systems Test Facility (MSSTF) at Sandia Laboratories, Albuquerque, New Mexico are summarized. The system is a dispersed power system that collects solar energy and supplies both the electrical and thermal energy demands of a representative load. Testing was done between July 1976 and March 1978. The Phase IVA MSSTF studied consists of: (1) a 200-m sq m (2160-sq ft) east-west parabolic trough collector field subsystem, which collects a measured 431-kWh thermal on a typical winter day and as estimated 483 kWh on a typical summer day; (2) a high-temperature thermocline storage subsystem, capable of storing 278-kWh thermal energy in Therminol 66 between 240 C and 310 C; (3) fluid-transfer equipment, including piping, pumps, and valves; (4) a prime-mover subsystem (toluene heat exchanger and turbine/generator) to convert thermal energy to electrical energy; and (5) a control and data-acquisition system. A brief description of each of these elements is given, and test results are reported. DOE

ENERGY CONSERVATION: POLICY ISSUES AND END-USE SCENARIOS OF SAVINGS POTENTIAL. PART 3: POLICY BARRIERS AND INVESTMENT DECISIONS IN INDUSTRY
Sep. 1978. 54 p.
(Contract W-7405-eng-48)
(LBL-7896-Pt-3) Avail: NTIS. HC A04/MF A01.

Industrial decision making was investigated with respect to energy conservation. It was concluded that government policy could be formulated to encourage conservation investments, but government intervention should be limited to those situations where it is both necessary and likely to be effective. To assist policy makers in understanding the industrial decision making process and recognizing the factors which prevent a measure from being adopted, a methodology is developed that can be applied to most conservation measures in all industrial subsectors. The methodology is summarized in two flow charts and a matrix. DOE

INFLUENCE OF ELECTROLYTE COMPOSITION ON ELECTRODE KINETICS IN THE MOLTEN CARBONATE FUEL CELL
P. Ang and A. F. Sammells. 1978. 30 p. refs. Presented at the 2d Intern. Symp. on Molten Salts, Pittsburgh, Pa., 15-20 Oct. 1978; sponsored by the Electrochem. Soc., Inc.
(Contract EM-78-C-03-1735)
(CONF-781063-2) Avail: NTIS. HC A03/MF A01.

Electrode Kinetics for fuel oxidation on nickel and cobalt electrodes is discussed for three selected molten carbonate mixtures. Activation kinetics under the probable mixed-control conditions present in the electrochemical half-cell were determined using a potential step technique. With all melts, the highest exchange current values were found on nickel anodes, and the highest of these values were found for the melt comprised of 43.5 mole percent Li2CO3 31.5 mole percent Na2CO3 25 mole percent K2CO3. For this ternary melt the exchange current density on nickel varied from 78 mA/sq cm for intermediate-Btu fuel to 22 mA/sq cm for low-Btu fuel at 650 C. The exchange current density was found to have a reaction order of around 0.25 for hydrogen, carbon dioxide, and water. Electrochemical performance on the two anode materials in the three melts is discussed, and a tentative reaction mechanism for the oxidation reaction is suggested. DOE

ENERGY SAVINGS FOR A SOLAR HEATED AND COOLED BUILDING THROUGH ADAPTIVE OPTIMAL CONTROL
D. R. Farris and James L. Melsa. Nov. 1978. 9 p. refs. Presented at IEEE Conf. on Decision and Control, San Diego, Calif., 10 Jan. 1979. Prepared in cooperation with Notre Dame Univ.
(Contract W-7405-eng-36)
(LA-UR-78-2986; Conf-790105-1) Avail: NTIS. HC A02/MF A01.

The applicability of adaptive and optimal control techniques to the control of heating, ventilating, and air conditioning systems of solar heated and cooled buildings is described. The suitability of optimal and adaptive concepts is discussed and the selected approach is explained. An integral quadratic cost functional to define optimal performance and an identification process to produce a linearized building model are discussed. The building model is described and heating system simulations of three versions of the adaptive optimal controller are reported along with a simulation of a conventional controller for comparison. A rubberized epoxy resin that offers improved fracture toughness and suitable performance at moderately elevated temperatures (up to 70 C) and six epoxy resins for service at 150 C were evaluated. In addition, the rubberized epoxy resin was used as a matrix in Kevlar 49 composites and engineering design data were generated. Stress rupture tests were initiated on E-glass composites at load levels of 60% to 85% of short term strength. Dynamic fatigue tests on Kevlar 49 composites in the tension-tension mode and fatigue tests on a Kevlar 49 composite ring specimen at 50% to 75% ultimate strength were begun. DOE

SPECTRALLY SELECTIVE SURFACES WITH COATINGS COMPRISED OF ULTRAFINE METAL PARTICLES
C. G. Granqvist. 1978. 15 p. refs. Presented at the Symp. on Solar-Thermal Power Stations, Cologne, 12 Apr. 1978.
(AED-Conf-78-212-004; Conf-780425-7) Avail: NTIS. HC A02/MF A01.
Efficient photothermal conversion of solar energy requires high absorption at wavelengths lambda > lambda/sub c/ and low absorption at lambda > lambda/sub c/, where lambda/sub c/ is approximately 2 micro m. Such spectrally selective surfaces can be prepared by coating metal plates with films consisting of ultrafine metal particles dispersed in an insulating matrix. Gas evaporated Cr particles with diameters approximately 10 nm were used. Spectrophotometry in the range 0.3 < lambda < 25 micron m displayed good spectral selectivity. The parameters governing the position of lambda/sub c/ were determined. The crucial importance of the shape of the particles was documented, and, in general, increased eccentricity shifted lambda/sub c/ toward larger wavelengths. A similar shift was obtained for nonhomogeneous spheres whose dielectric core size was enlarged. DOE

UNDERGROUND PUMPED HYDRO STORAGE: AN OVERVIEW
S. W. Tam, C. A. Blomquist, and G. T. Kartsounes. 1978. 13 p. refs. Presented at the 1st Inform. Exchange Conf., Luray, Va., 24 Oct. 1978.
(Contract W-31-109-eng-38)
(CONF-781046-1) Avail: NTIS. HC A02/MF A01.
The status of underground pumped hydro storage (UPHS) for electric utility peaking and energy storage applications is reviewed. The salient features of major recent studies are reviewed. Turbomachinery options and advances in high head pump/turbines are discussed. The effect of head, capacity, turbomachinery unit size and type, and other performance variables on the cost of a UPHS plant are presented. Market potential, siting criteria, lower reservoir construction, and geological related issues are addressed. The environmental impact of a UPHS plant is reduced from comparable facilities, and these issues and other safety concerns are presented. DOE

DESIGN OPTIMIZATION OF AQUIFER RESERVOIR-BASED COMPRESSED AIR STORAGE SYSTEMS
Frederick W. Aherns 1978 12 p refs Presented at the Mech. and Magnetic Energy Storage Contractors' Inform. Exchange Conf., Luray, Va., 24-16 Oct. 1978
(Contract W-31-109-eng-38)
(CONF-781046-5) Avail: NTIS HC A02/MF A01

The application of a general compressed air energy storage (CAES) power system design optimization methodology to the class of CAES plants having aquifer air storage reservoirs is discussed. Performance and economic models for the aquifer reservoir, wells, piping, and air compression system are described. Identification of designs which minimize the subsystem power generation cost, while satisfying constraints related to the geology, equipment, and utility load curve are presented. The design specification resulting from the optimization procedure includes: land area to be purchased, well depth, number of wells, well spacing, wellbore diameter, main pipeline diameter, required compressor system power and discharge pressure, and required compression time durations for each day of the week. THE DYNAMIC RESPONSE OF SOLAR CELLS [COMPORTEMENT ELECTRIQUE DYNAMIQUE DE CELLULES SOLAIRES]
Jean-Pierre Catani Oct. 1978 92 p refs In FRENCH; ENGLISH summary
(CNES-NT-85) Avail: NTIS HC A05/MF A01

The dynamic response of solar generators was studied in relation to the design of power conditioning equipment and for applications in electromagnetic compatibility analyses. A mathematical model of solar cells was developed from impedance measurements performed under various conditions of temperature, charge, and illumination, before and after electron irradiation. This model was compared with that derived from the PN junction theory associated with static measurements. Using this data, an integration method was developed to simulate the dynamic response of a nominally illuminated solar generator under ambient ground conditions. Results show that it is possible to calculate the impedance of a solar cell in function of the frequency up to 1MHz, or for its equivalent circuit given static measurements. Author (ESA)

(Contract BMFT-ET-4056-A)
(BMFT-FB-T-78-48) Avail: NTIS HC A11/MF A01; Fachinformationszentrum Energie, Phys., Math., Eggenstein-Leopoldshafen, West Ger. DM 50,40

The use of solar energy to heat German army barracks was studied. Possibilities for the installation of solar energy systems for heating water and for general heating purposes were considered. Information on available building types, their construction, and intended use, as well as climatic parameters, was compiled. Four categories were analyzed. Results indicate that energy costs can be reduced by between 40 percent to 55 percent in the case of barracks. It is recommended to install four solar heating systems, two in buildings with flat roofs and two in buildings with pitched roofs. It is intended to study the influence of roof type on heating efficiency. Author (ESA)

INTERACTION IN LIMITED ARRAYS OF WINDMILLS: REVIEW OF EARLIER RESULTS FROM A SIMPLE MODEL AND A PRESENTATION OF THE CAPABILITIES OF A DYNAMIC PBL MODEL
Carl Crafoord 27 Mar. 1979 57 p refs Prepared in cooperation with Intern. Meteorol. Inst.
(DM-26) Avail: NTIS HC A04/MF A01

The problem of how closely packed an array of windmills can be erected without unduly interfering with each other is considered. A general technical background for the behavior of a single windmill in a homogeneous flow, together with a list of important parameters for the general performance of a group, is given. Earlier results for neutral stratification are reviewed and presented in a slightly different manner more fully illustrating the trade-off between windmill density and mean efficiency as function of group size. The analogy between plumes and wakes as a basis for a model formulation is reviewed. Preliminary results indicate a variation in mean efficiency of 13% for a group with 80 units, which may correspond to a factor of 2.5 in area coverage. A dynamic one dimensional planetary boundary layer model is presented and redesigned for simulation experiments. Using it, the regeneration of the wind profiles behind a windmill unit is studied for different ambient conditions. Preliminary results indicate a variation of up to a factor of 9 in the rate of regeneration of the profiles. How this data might be considered in a statistical analysis is discussed. Author (ESA)

SOLAR ENERGY WITH LATENT HEAT STORAGE: FUNDAMENTALS AND APPLICATIONS [SONNENENERGIE. LATENTSPEICHER. GRUNDLAGEN AND ANWENDUNGEN]
Oct. 1978 78 p refs In GERMAN; ENGLISH summary
(ASSA-10/1978) Avail: NTIS HC A05/MF A01

Solar heating systems are examined in terms of their year-round efficiency. The desirability of storing the surplus of solar energy in summer for the heating period autumn and winter is mentioned. Possible storage schemes, such as water storage, ground storage, and latent heat storage, are examined. It is

shown that water and ground as storage mediums have only small thermal storage capacity and, therefore, need large volumes. As far as latent-heat-storage is concerned, a phase-conversion (solid to liquid) is caused by the supply of heat and this process is reversed again by the withdrawal of heat. Thus, the heat is being stored in the form of conversion energy and the storage volumes become considerably lower since the energy density is much higher. Possible media for latent storage are compiled and their features described. The present state of technology is explained by illustrating applications. Economic aspects and conclusions are presented. THE SMEARED CONCENTRATION APPROXIMATION METHOD: A SIMPLIFIED AIR POLLUTION DISPERSION METHODOLOGY FOR REGIONAL ANALYSIS
R. L. Dennis Jul. 1978 78 p refs
(IIASA-RR-78-9) Avail: Issuing Activity

A methodology, the smeared concentration approximation (SCA) method, which allows the inclusion of air pollution dispersion in the long-term analysis of air pollution impact without the direct use of complex, large air pollution models is developed. The SCA method is intended for use in models and analysis concerned with long-term policy analysis and where simulation is one of the important techniques employed. The SCA method centers around short-range transport of dispersion on the urban scale for each of three emission classes: low-level area sources, medium-level point sources, and high-level point sources. A central assumption of the SCA method is that a single spatially averaged exposure for an urban area is a sufficient indicator of air pollution exposure for long-term policy option analysis. Initial validation of the SCA method indicates that the spatially averaged exposure calculated by the means of the SCA dispersion parameters is within 20% of the spatially averaged monitoring data. METAL HYDROXIDES FROM ELECTROPLATING SLUDGE CHARACTERIZATION AND METAL RECOVERY Final Report, 29 Jul. 1977 - 18 Feb. 1978
John T. Novak, Mriganka M. Ghosh, William Knoche, Thomas Clevenger, and Charles Yeh May 1979 281 p refs
(Contract F08635-77-C-0281; AF Proj. 2054)
(AD-A070233; AFESC/ESL-TR-79-09) Avail: NTIS HC A13/MF A01 CSCL 13/2

The purpose of this project was to investigate the precipitation of metals from plating facilities, to determine the dewatering characteristics of the resultant metal hydroxide slurries and to evaluate the solvent extraction process for metal recovery and reuse. Individual metals were found to precipitate according to the theoretical solubility calculations, however, mixed metals solutions containing Cr (III) often would form 'co-precipitants.' The co-precipitation would result in certain metals precipitating at pH levels below the range of predicted insolubility. Colloidal metal hydroxides remaining after settling could be removed by filtration using either a gravity filter or diatomaceous precoat pressure filter. Metal removal was effective (≈95%) but the filtrate metal concentrations were not sufficiently low to meet effluent requirements. Sludges produced by hydroxide precipitation varied depending upon the pH of precipitation and the specific metals in the sludge. Sludge dewatering characteristics were found to be determined by the mean particle size of the flocs. Polymers improved dewatering rates by increasing the mean floc size. Freshly precipitated chronium hydroxide sludges were found to pass through filtering media because of floc break-up. Polymer conditioning was necessary to prevent sludge penetration through the filter media. Solvent extraction could be used to selectively extract individual metals from a mixed metal sludge but the process was not economical. GRA

KINETIC STUDIES OF GAS MIXTURES AND THEIR APPLICATION TO GAS LASERS AND POLLUTANT DETECTION
C. H. Chen, J. D. Judish, and M. G. Payne 1978 6 p Presented at Conf. on Appl. of Small Accelerators, Denton, Tex., 6 Nov. 1978
(Contract W-7405-eng-26)
(CONF-781113-6) Avail: NTIS HC A02/MF A01

A 2 MeV proton beam with a 10 ns pulse width was used to excite various gas mixtures. The emitted vacuum ultraviolet and ultraviolet visible photons passing through separate monochromators were detected by using single photon counting techniques. Time resolved and time integrated fluorescent spectroscopy was used to study the detailed mechanism of excitation energy transfer, Penning ionization, charge transfer, and ion-ion recombination processes. The energy precursors of various excited species in a number of gas mixtures were identified, and the quenching rates of excited atoms and ions by numerous small molecules were measured. Relative fluorescence efficiencies and energy pathways of proton excited gas mixtures were used to study the kinetics of high power gas lasers. An ultrasensitive method for the detection of certain pollutants utilizing energy or charge transfer processes in proton excited gas mixtures was developed. DOE

ENERGY DEVELOPMENT vs WATER QUALITY IN THE UPPER COLORADO AND UPPER MISSOURI RIVER BASINS
A. B. Bishop, S. L. Klemetson, M. F. Torpy, and M. McKee Oct. 1978 84 p refs
(Contract W-7405-eng-36)
(LA-7497-MS) Avail: NTIS HC A05/MF A01

Impacts from energy developments are discussed in terms of the various pollutants generated by energy extraction and processing activities, and the pollution transport mechanisms and pathways by which they can enter surface and groundwater. The implications for energy development of the water quality aspects of legislative requirements and regulations are discussed. Many of the potential water pollution problems associated with energy development will occur through the transport of pollutants from air pollution and solid waste disposal. The consumptive use of all water withdrawn for energy processing as a pollution control measure raises three important issues-each of which represents a potential conflict between energy developers compliance with the legislation and western water law: (1) junior rights and water transfer, (2) the beneficial use question, and (3) the reasonable use measure of certain water quality practices. IMPLEMENTATION PLAN FOR THE DETERMINATION OF THE ATMOSPHERIC CONTRIBUTION OF PETROLEUM HYDROCARBONS TO THE OCEANS.
Robert A. Duce 1979 59 p refs Sponsored by UN Environ. Programme (UNEP)
(WMO-504; SER-12; ISBN-92-63-10504-9) Avail: NTIS HC A04/MF A01; WMO, Geneva SWFR 15

An implementation plan for the collection and analysis methodology to determine the atmospheric concentration and fluxes of petroleum hydrocarbons entering the open ocean from the atmosphere is developed. Included are detailed discussions of sampling site selection, atmospheric and sea-surface sample collection, analytical procedures, and a proposed timetable. It is recommended that this program be initiated on a pilot study basis in Bermuda and American Samoa. Since the measurement of petroleum hydrocarbons in the atmosphere is not routine of standardized at this time, it is recommended that this program be undertaken in a research mode, with one laboratory selected to develop and test in detail the collection and analytical procedures. THE USE OF A TRAJECTORY MODEL FOR STUDYING INTERREGIONAL TRANSPORT OF AIR POLLUTION
J. Reiff and C. A. Velds 1979 37 p refs
(KNMI-WR-79-6) Avail: NTIS HC A03/MF A01

The possibility of using a trajectory model, including vertical wind components, to calculate the path of air pollution traveling across the German-Netherlands border is considered. The operational trajectory model, which principally was set up for weather forecasting and which uses windfields from three layer vorticity model is described. The properties of a near-future trajectory model based on a four layer vorticity model are also discussed. The accuracy of the trajectory model is specified. Two periods of interregional transport were studied. Trajectories, calculated with the operational model, arriving at the 850 mbar level are compared with hand-analyzed trajectories at the 10 m level and with trajectories in the 80 to 200 m layer. Results show that a trajectory model including vertical wind, together with the four layer model, promises success for air pollution studies as air paths can be calculated fairly easily on a routine basis. AIRBORNE OIL SPILL SURVEILLANCE SYSTEMS IN SWEDEN
L. Backlund 12 Mar. 1979 20 p
(FP1-9) Avail: NTIS HC A02/MF A01

Two different oil spill surveillance systems are described. These systems are presently installed in two Cessna 337 aircraft. One of the systems is based on a side looking airborne radar (SLAR) and the other on a Daedalus IR/UV-line scanner. In both systems imagery generated from the sensors is presented in real-time on a TV-monitor to the operator/co-pilot in the aircraft. The SLAR system generates black-and-white imagery whereas the IR/UV-scanner system uses false color coding for image enhancement. The IR/UV-scanner system also has capabilities of recording unprocessed data on tape, polaroid photographing of displayed images, and near real-time image transmission down to ships via a TV video to Xerox telecopier interface and a voice channel link. The technical evaluation and field testing of the two systems is summarized. Most of the tests were carried out in the Baltic Sea and included oil spill detection, cleanup surveillance, ice reconnaissance, monitoring

of fishing activities, and search and rescue operations.

HOT GAS CLEANUP
G. F. Morrison Mar. 1979 53 p refs
(ICTIS/TR-03; ISBN-92-9029-017-X) Avail: NTIS
HC A04/MF A01

The current technological status of hot gas cleanup systems for cleaning gases from coal gasifiers or fluidized bed combustors prior to their use in combined cycle power generating systems is reviewed. Self contained cleanup systems which can be applied to various gasifiers or combustors are emphasized. Contaminants in the gas stream are identified as sulphur compounds, particulates, nitrogen compounds, and trace elements. Hot gas desulphurization processes are classified according to the sorbent on which they are based (iron oxide or calcium). Particulate removal is subdivided according to the separation technique. Cyclones, surface and depth filters, and electrostatic precipitators are covered.

SUMMARY REPORT ON MOTOR VEHICLE EMISSIONS INSPECTION AND MAINTENANCE PROGRAMS FOR NON-ATTAINMENT AREAS IN LOUISIANA Final Report
John Dadiani and Thomas J. Raubacher Feb. 1979 42 p refs
(Contract EPA-68-02-2541)
(PB-294979/0; EPA-906/9-79-001) Avail: NTIS
HC A03/MF A01 CSCL 13B

General information is documented on motor vehicle inspection and maintenance (I/M) with respect to the metropolitan areas of New Orleans, Baton Rouge, and Shreveport. A background discussion of events leading to the need for an I/M program is provided. A general description of I/M is provided with respect to types of programs, the benefits of I/M, and information on implementation activities. Expected hydrocarbon emission reductions are included.

STUDIES OF DUST CAKE FORMATION AND STRUCTURE IN FABRIC FILTRATION: SECOND YEAR
Bernard Miller, George Lamb, Peter Costanza, George Harriott, and Janet Dunbar Apr. 1979 48 p refs
(Grant EPA-R-804926)
(PB-297581/1; EPA-600/7-79-108) Avail: NTIS
HC A03/MF A01 CSCL 13K

The experiments to improve fabric filter efficiency and pressure drop by use of electric fields near the filter surface are described. Modified fiber geometries and fabric construction are investigated. The features of the dust cake and the fabric dust system which explain the observed changes in performance are identified. This design of improved filter fabrics and systems are discussed.

A FIELD STUDY OF THE RELATIONSHIP BETWEEN HEAVY METAL CONCENTRATIONS IN STREAM WATER AND SELECTED BENTHIC MACROINVERTEBRATE SPECIES M.S. Thesis
Richard P. Maas 1978 79 p refs
(Contract DI-14-34-0001-9035)
(PB-297284/2; W79-07570; OWRT-A-095-NC(1)) Avail: NTIS HC A05/MF A01 CSCL 13B

The correlation between heavy metal concentration in stream water and selected benthic macroinvertebrate species from stations on the Neuse River, N.C. watershed was studied to determine the utility of benthic macroinvertebrates as monitors of short and long term stream metal conditions. Cadmium, and zinc were determined in both water and test organisms by graphite furnace atomic adsorption spectrophotometry (GFAAS). The GFAAS method proved satisfactory for metal quantifcation in all water and test organism samples. Relatively good linear correlations between water and test organism metal concentrations were observed for most cases.

EXTENDED TESTS OF SAFFIL ALUMINUM FILTER MEDIA Final Report, Feb. 1978 - Feb. 1979
M. A. Shackleton May 1979 30 p refs
(Contract EPA-68-02-2611)
(PB-297567/0; EPA-600/7-79-112) Avail: NTIS
HC A03/MF A01 CSCL 13K

Dust feeding of Saffil alumina ceramic filters was tested at 800 C and 10 atm pressure, using reentrained fly ash. Pressure drop and collection efficiency were determined as functions of time and filter face velocity. Off line cleaning by reverse pulse was effective in maintaining low pressure drop after a cleaning cycle. Collection efficiency was high and was also substantially independent of face velocity over the range tested. Outlet concentration was less than the most stringent requirements proposed for turbine applications and showed a trend toward lower values at higher filtration velocity. Mechanical durability was indicated in that none of the test filters appeared to have been damaged by the 200-hour tests with cleaning at 10 minute intervals.

AIR QUALITY MAINTENANCE ANALYSIS FOR NEW JERSEY-NEW YORK AND MID-HUDSON AQMA Final Report
Kenneth W. Wiltsee, Jr., William L. Frech, and David B. Ramsay Jun. 1979 408 p refs
(Contract EPA-68-02-2866)
(PB-297988/8; GCA-TR-79-19-G; EPA-902/4-78-006) Avail: NTIS HC A18/MF A01 CSCL 13B

The year 1975 was used as the base for the air quality maintenance analysis and projections were made to 1980, 1985, and 2000. An emissions inventory created under a previous contract was reviewed and updated using best available data. Improvements were made in the point source inventory, county level area source inventories, and subcounty allocation procedures.

A version of the AQDM model was validated and then used to predict annual regional air quality levels for each year. The results indicate that annual primary SO2 and TSP standards could be exceeded in the South Bronx by 2000. TSP levels throughout much of northeastern New Jersey and New York City exceed the secondary TSP annual guidelines. GRA

TECHNICAL ASSESSMENT OF THERMAL DeNOx PROCESS Final Report, Nov. 1977 - Dec. 1978
C. Castaldini, K. G. Salvesen, and H. B. Mason May 1979 138 p
(Contract EPA-68-02-2611)
(PB-297947/4; EPA-600/7-79-117) Avail: NTIS
HC A07/MF A01 CSCL 13B

The thermal deNOx process applied to coal fired utility boilers is assessed. It is concluded that the process is a promising technique for controlling NOx emissions. However, flue gas temperature fluctuations may limit NOx reductions to approximately 50%. In addition, operational and environmental impacts of NH3 emissions and ammonium bisulfate formation could further limit the performance of the process and effect is applicability. Costs depend primarily on boiler size, initial NOx concentration, and level of control required. The impact of widespread process implementation on the ammonia market, feedstock supplies, and their costs are considered and found to be small. GRA

MOBILE BED FLUX FORCE/CONDENSATION SCRUBBERS Final Report, Nov. 1975 - Dec. 1978
S. C. Yung, R. Chmielewski, and S. Calvert Feb. 1979 262 p refs
(Contract EPA-68-02-2124)
(PB-297198/4; EPA-600/7-79-071) Avail: NTIS
HC A12/MF A01 CSCL 13B

Fine particle collection in mobile bed scrubbers was determined experimentally. Particle collection efficiency increased greatly as the gas phase pressure drop increased. Compared to packed bed and sieve plate scrubbers, the mobile bed scrubber had better efficiency when the pressure drop was above 20 cm W.C. Limestone in the scrubber liquid had no effect on particle collection. When the mobile bed scrubber was used as a flux force/condensation (FF/C) scrubber, it had better performance characteristics than sieve plate and spray scrubbers with condensation. However, its capability was inferior to a FF/C system consisting of a condenser and venturi scrubber. Correlations to predict particle collection and pressure drop were developed. GRA

INTERACTION OF LOW LEVELS OF OZONE AND RELATIVE HUMIDITY ON LEAFY VEGETABLES Final Report, Jun. 1977 - Oct. 1978
J. P. Bennett Mar. 1979 30 p refs
(Contract ARB-AG-194-30)
(PB-297062/2; ARB-R-AG-194-30-79-98) Avail: NTIS
HC A03/MF A01 CSCL 13B

The effects of varying levels of ozone and humidity on the yields of leaf lettuce and spinach were studied. Generalizations about yield losses in humid vs. dry environments were not possible because spinach yield losses due to ozone were greater at 50% than at 80% relative humidity while lettuce yield losses followed the opposite pattern. Lettuce plants were also significantly smaller and more tender, rendering them unmarketable regardless of the weight loss. This occurred at a concentration below the California one hour ozone standard of 0.10 ppm and suggests that the standard does not adequately protect this crop. GRA

REDUCTION OF AIR EMISSIONS FROM GASOLINE STORAGE TANKS Final Report, Jan. 1978 - Jan. 1979
Arnold Gunther May 1979 39 p
(Contract EPA-68-02-2679)
(PB-297976/3; EPA-600/2-79-108) Avail: NTIS
HC A03/MF A01 CSCL 13B

The technical and economic feasibility of using flexible plastic membranes to control emissions from gasoline storage tanks was investigated. A demonstration pilot unit was built and operated. The emission rates were determined as well as the life expectancy of the membranes. The results indicate that emission control of 99-plus percent, compared to uncontrolled tanks, can be achieved readily, and that the life expectancy of the membranes is in the order of 20 years of continuous service. The estimated installed cost of these devices for commercial application is very competitive with conventionally used floating roofs. GRA

TEST OF FABRIC FILTRATION MATERIALS Final Report, Jun. 1973 - Dec. 1978
Jan R. Koscianowski, Lidia Koscianowska, and Maria Szablewicz Mar. 1979 268 p refs
(PB-297500/1; EPA-600/7-79-087) Avail: NTIS
HC A12/MF A01 CSCL 13K

The report describes pilot scale and laboratory tests of U.S. and Polish woven baghouse fabrics. Cotton, polyester, aramid, and glass fabrics were tested using cement, flyash, coal, and talc dusts at loadings of about 10 g/cu m, filtration velocities of 60 and 80 cu m/sq m, and ambient temperature and humidity. General conclusions reached were: (1) air permeability is a poor predictor of fabric performance, (2) fabric construction parameters do not correlate well with the resistance coefficient for fabrics KI, (3) a critical value of pressure drop exists above which fissures are formed in the dust cake, (4) there is a maximum in the efficiency versus air-to-cloth-ratio curve which is related to fissure formation, and (5) cleaning properties of the fabric depend primarily on its chemical composition, the dust being filtered, and the superficial structure of the dust cake and fabric (they do not depend on air-to-cloth ratio). PHYSICAL REGIONALIZATION OF COASTAL ECOSYSTEMS OF THE UNITED STATES AND ITS TERRITORIES
Terry T. Terrell Mar. 1979 39 p refs Sponsored in part by EPA
(PB-297143/0; FWS/OBS-78-80) Avail: NTIS
HC A03/MF A01 CSCL 13B

A hierarchical regional classification scheme for partitioning coastal ecosystems of the United States and its territories based on the physical (mainly hydrological and geological) characteristics of those areas was formulated. Physical rather than biotic criteria were utilized so as to define whole ecosystems, rather than to define the distribution of a few species. The classification provides a data collection structure and delineates geographic zones about which predictions on the structure and functioning of ecosystems within these zones may be made at various levels of resolution. Boundaries as defined by the National Wetlands Inventory were used extensively for landward and seaward limits. GRA

AN INVESTIGATION OF A MATHEMATICAL MODEL FOR ATMOSPHERIC ABSORPTION SPECTRA Interim Report
Edward R. Niple Jul. 1979 88 p refs
(Grant NsG-7479; RF Proj. 761420/711626)
(NASA-CR-162430) Avail: NTIS HC A05/MF A01 CSCL 04A

A computer program that calculates absorption spectra for slant paths through the atmosphere is described. The program uses an efficient convolution technique (Romberg integration) to simulate instrument resolution effects. A brief information analysis is performed on a set of calculated spectra to illustrate how such techniques may be used to explore the quality of the information in a spectrum. Author

GLOBAL LIGHTNING DISTRIBUTION AT DAWN AND DUSK FOR AUGUST-DECEMBER 1977 AS OBSERVED BY THE DMSD LIGHTING DETECTOR Interim Report
Bruce C. Edgar 15 Jun. 1979 35 p refs
(Contract F04701-78-C-0079)
(AD-A071896; TR-0079-4639-1; SAMSO-TR-79-43) Avail: NTIS HC A03/MF A01 CSCL 04/1

The lightning detector aboard a DMSP satellite in a dawn-dusk polar orbit sampled lightning activity worldwide during August-December 1977. At dawn the distribution of events is somewhat evenly spread over both hemispheres with a slight bias towards land areas in the summer hemisphere. There is significant activity over the oceans in both hemispheres at dawn, presumably due to radiative cooling of the atmosphere. However, at dusk lightning occurs primarily over the warmer land areas in the summer hemisphere with very few events in the winter hemisphere. Also there is a marked increase of lightning events about the tropical convergence zone. These distribution plots give for the first time a global snapshot of lightning activity which could lead to a better understanding of the global atmospheric noise distribution. GRA

MEASUREMENTS OF IMPORTANT MINOR CONSTITUENTS IN THE MIDDLE ATMOSPHERE Final Report, Apr. 1976 - Apr. 1979
John J. Olivero 19 Jun. 1979 10 p refs
(Grants DAAG29-76-G-0219; DAAG29-78-G-0083)
(AD-A071845; PSU-IRL-FR-79/2; ARO-13877.3-GSX) Avail: NTIS HC A02/MF A01 CSCL 04/1

This final report summarizes two major projects. The first is the design and development of a ground based microwave radiometer for the measurement of water vapor in the middle atmosphere. The second is the detailed study of the possible existence of small ice particles in the mesosphere under normal

conditions as has been hypothesized by D-region electrical structure measurements. GRA

ELIMINATION OF THE EFFECT OF SURFACE MICROTOPOGRAPHY IN AN IMPROVED SOIL SKIN MOISTURE DETERMINATOR
Inge Dirmhirn. White Sands Missile Range, N. Mex. Atmospheric Sciences Lab. Jun. 1979 20 p refs
(Contract DAEA18-78-C-0051; DA Proj. 1L1-62111-AH-71)
(AD-A072814; ERADCOM/ASL-CR-79-0051-1) Avail: NTIS HC A02/MF A01 CSCL 08/13

This report discusses the development of an instrument, the soil surface moisture determinator (SSMD), that provides soil surface moisture independent of the microstructure of the surface. Such an instrument was needed because the reflection characteristics of soils and sands depend on the moisture and microstructure of the surface layer; and under natural conditions; the many surfaces of different slope and exposure that account for the soil surface layer interfere with a simple relation between soil moisture and reflection. Tests performed with the SSMD show that the instrument can provide knowledge of the moisture content of the soils with one simple measurement. The results of the measurements do not provide information on the moisture condition within the soil, but the knowledge of the moisture of the surface layer can readily be correlated with all remotely detected data. Synthetic displacement, velocity and acceleration seismograms and the resulting response spectra are computed and analyzed for earthquake ground motions in the western United States. A source model for the 1975 Pocatello Valley earthquake is used with plane layered earth models to estimate the ground motions at Minuteman Wing V which is at a range of about 700 km. The 1975 Yellowstone earthquake was a similar event at the same range from Wing V. However, the ground motions are estimated to be an order to magnitude smaller due to three effects: the two earthquakes were the same size at long periods but the Yellowstone event appears to be a factor of 2 to 4 smaller at short periods; the sources are oriented such that radiation pattern differences between the two events are nearly maximum; the Yellowstone caldera and, perhaps, other highly attenuating structures to the south cause the Wing V ground motions from the Yellowstone event to be much smaller than otherwise expected. METHOD OF CALCULATING H2O TRANSMISSION BETWEEN 333 AND 633 cm-1 Final Report, 4 Oct. 1976 - 30 Sep. 1978
Darrell E. Burch and David A. Gryvnak Apr. 1979 52 p refs
(Contract F19628-76-C-0302; AF Proj. 7670)
(AD-A072850; AFGL-TR-79-0054; U6503) Avail: NTIS HC A04/MF A01 CSCL 04/1

Spectral absorption data are presented for H2O between 1/333 cm and 1/633 cm. An empirical continuum has been determined to account for all of the absorption not attributed to absorption lines centered within approximately 1/30 cm of any wavenumber of observation. The empirical continuum, which consists of one part for self broadening of the H2O lines and one part for N2 broadening, has been determined experimentally for three temperatures: 296K, 338K and 430K. Other values based on extrapolation have been determined for lower temperatures representative of the atmosphere. A line-by-line calculation scheme involving the empirical continuum and the AFGL line parameters has been used to calculate spectra for several samples investigated in the laboratory. The calculated spectra agree quite well with the laboratory spectra. GRA

LOW LATITUDE ATMOSPHERIC X-RAYS OBSERVED BY HEAO-1 Interim Report
Janet G. Luhmann, Hugo R. Rugge, J. Bernard Blake, and Lee A. Christopher 16 Jul. 1979 22 p refs
(Contract F04701-78-C-0079)
(AD-A072722; TR-0079(4960-05)-4; SAMSO-TR-79-69) Avail: NTIS HC A02/MF A01 CSCL 04/1

The low energy (0.15-3keV) proportional counter detectors of the A-2 experiment on the X-ray astronomy satellite HEAO-1 have detected night-time atmospheric emissions at the limb of the earth. Three observations of this phenomenon occurred during the first two months of operation. On two occasions, fluxes greater than the diffuse galactic background were detected when the detectors scanned the limb in the vicinity of the magnetic conjugate point of the South Atlantic Anomaly. Enhanced emissions were also observed on a single scan of the atmosphere over northern Africa. The X-rays are presumed to result from bremsstrahlung generated by precipitating electrons. In the case of the emissions related to the Anomaly conjugate point, it is suggested that the electrons were secondaries backscattered from the atmosphere above the Anomaly during the intensified precipitation of radiation belt particles that occurs throughout a magnetic storm recovery period. These initial observations demonstrate that the earth's atmosphere can be a significant X-ray source at low latitudes as well as in the auroral zones, and hence that it may be practical to remotely monitor the global morphology of particle precipitation by satellite observations of terrestrial X-rays. CORRELATION STUDIES OF PROTONOSPHERIC ELECTRON CONTENT OVER THE US CONTINENT Environmental Research Papers
A. Shuval, J. A. Klobuchar, and H. Soicher 6 Mar. 1979 27 p refs
(AF Proj. 4643)
(AD-A073080; AFGL-TR-79-0064; AFGL-ERP-658) Avail: NTIS HC A03/MF A01 CSCL 08/14

Measurements of the electron content of the earth's protonosphere N sub p, defined here as the region above the height where Faraday rotation measurements of VHF signals

are significant, have been compared from pairs of stations in North America. Results of studies of N sub p and of the variabilities from the monthly mean values at station pairs show a lower correlation than expected. Correlation coefficients of total electron content data taken at the same station pairs by the group-delay technique and by the Faraday rotation technique are significantly higher than those from N sub p data. The random component necessary to explain the lower than expected correlation of N sub p values is larger than the estimated data accuracy from the stations. From the available data we are unable to conclude whether or not the lower than expected correlation coefficients represent a real random component in the protonosphere having horizontal scale sizes less than 400 km. NON-NEUTRAL FIELD-ALIGNED CURRENT SHEET AND AURORAL ELECTRIC FIELD Final Report, 15 May - 31 Dec. 1978
R. K. Albano, L. C. Lee, and J. R. Kan Feb. 1979 21 p refs
(Contract F19628-78-C-0128; AF Proj. 2311)
(AD-A072852; AFGL-TR-79-0066) Avail: NTIS
HC A02/MF A01 CSCL 04/1

Equilibrium configurations of the non-neutral field-aligned electron current sheet in a Maxwellian plasma are obtained from solutions of the time-independent Vlasov-Maxwell equations. This is the first field-aligned non-neutral current sheet model in a hot plasma in which the electrons are allowed to be nonadiabatic. The current in this model has a perpendicular as well as a parallel component to the external magnetic field. The electric field of the current sheet is pointing normally toward the midplane of the sheet. This zeroth-order perpendicular electric field is identified as the primary electric field which gives rise to a few keV potential drop along auroral field lines. GRA

HC A04/MF A01 CSCL 04/1

Precision low elevation angle radar observations of orbiting spheres were used to evaluate the utility of surface based refraction techniques. Elevation angle error measurements were obtained from differences between the precision radar measurements and the true or absolute position of the orbiting sphere obtained from a multiple pass orbit determination using data from the same radar system. The results of the refraction effects study show that the average observed elevation angle error caused by refraction is identical with the average calculated elevation angle error obtained from ray tracings using radiosonde data to within the measurement accuracy of the radar system. The results also reveal a relatively large uncorrectable component of the elevation angle error caused by small scale refractive index gradients. This uncorrectable component is of the order of 30 millidegrees (mdeg) at a true elevation angle of 1 degree and 4 mdeg at 10 degrees. GRA

STUDY OF THE EQUATORWARD EDGE OF THE AURORAL OVAL FROM SATELLITE OBSERVATIONS Scientific Interim Report Environmental Research Papers
B. S. Dandekar 9 Jan. 1979 44 p refs
(AF Proj. 4643)
(AD-A072997; AFGL-TR-79-0010; AFGL-ERP-650) Avail: NTIS HC A03/MF A01 CSCL 04/1

The auroral ovals in the Northern and Southern Hemispheres observed by the optical instruments aboard the DMSP satellites are studied on a statistical basis in terms of the temporal, spatial, and magnetic activity dependence of the equatorward edge of the diffuse (continuous) aurora. In the nightside (18-08 CGT), the equatorward edges of the auroral ovals are located predominantly in the latitude range 61 deg - 69 deg CGL. They show strong dependence on the levels of magnetic activity. Of the indices Kp, AE, Dst, and Q, the Q index is correlated best with the position of the equatorward edge of the diffuse aurora. Assuming that the auroral oval is approximately circular in a CG coordinate system, the dependence of the radius of the auroral oval on magnetic activity is determined. The radius and the center of the auroral circle changes with variation in magnetic activity. The ovals of the Northern and Southern Hemispheres consistently show an asymmetry. On the nightside, the oval in the Southern Hemisphere is located about 1 deg closer to the equator than the oval in the Northern Hemisphere. GRA

PHASE SPACE COORDINATES OF LONG LIFETIME TRAPPED RADIATION FROM STOERMER MAPPING
Charles W. Dubs 18 Jan. 1979 28 p refs
(AF Proj. 2311)
(AD-A072995; AFGL-TR-79-0029; AFGL-ERP-655) Avail: NTIS HC A03/MF A01 CSCL 04/1

The concept of an 'essentially closed' manifold and several theorems on a plane mapping are introduced and applied to a 'Stoermer mapping' for a particle trapped in a dipole magnetic field. The trapped region is found to be divisible into many subregions in any one of which a particle forever remains confined. Alternatives are given to Dragt and Finn's interpretation that homoclinic points exist. A method is given of determining if they do exist. Numerical examples are given of regions of phase space where protons should have a long lifetime. GRA

A DYNAMICAL MODEL FOR THE ONSET OF MAGNETOSPHERIC SUBSTORMS
P. L. Rothwell and G. K. Yates 13 Dec. 1978 44 p refs
(AF Proj. 7601)
(AD-A072987; AFGL-TR-78-0306; AFGL-ERP-647) Avail: NTIS HC A03/MF A01 CSCL 04/1

A model for the onset of magnetospheric substorms is developed based on the observations of Pytte et al (1976). North-south single-particle motion across the plasma sheet becomes instrumental in generating magnetic instabilities when the plasma sheet is sufficiently compressed. The number density times the square of the plasma sheet thickness is found to be the critical parameter (nl squared less than or equal to 8.1 x 10 to the 15th power protons/cm). A merging theory is developed based on these magnetic instabilities. The nightside merging rate is controlled by the value of the magnetic field in the tail lobes which, in turn, is dependent on the dayside merging rate. Merging and collisional damping of the J x B force contribute to the heating of the plasma sheet. The 10-15 min interval between onsets is interpreted in terms of a weak coupling between the tail lobes and the plasma sheet. A straightforward application of small-amplitude oscillation theory shows that the period between onsets is a direct measure of the mean collision frequency in the plasma sheet. The obtained value is in good agreement with that calculated from the resistivity relation. GRA

SIMULATION OF LAND-USE PATTERNS AFFECTING THE GLOBAL CARBON CYCLE Ph.D. Thesis
Y. H. Chan, J. S. Olson, and W. R. Emmanuel Jan. 1979 183 p refs
(Contract W-7405-eng-26; ESD-Publ-1273)
(ORNL/TM-6651) Avail: NTIS HC A09/MF A01

Past increase of atmospheric CO_2 involves significant contributions from both fossil and nonfossil (biospheric) sources. A simulation model was used to reconstruct changes since 1860 and project four hypothetical future scenarios of CO_2 injection to 2460. Nineteen compartments and their exchanges of carbon were considered. Areal extent of tropical forests, other wooded ecosystems, and nonforests were incorporated into the model. Rapidly and slowly exchanging pools of carbon per unit area, and net primary production for each pool and exosystem group, were projected by integrating income loss differential equations numerically using SSMP programming language. Limits of exploitable forest area and biomass were evaluated and found to contribute much less future CO_2 than the usable coal, oil, gas, and oil shale. DOE

DEVELOPMENT AND TESTING OF EQUIPMENT FOR AEROLOGICAL MEASUREMENTS ON BOARD SMALL ROCKETS AND AIR-DROPPED OBJECTS Final Report
Georg Pfotzer Bonn Bundesmin. fuer Forsch. u. Technol. Aug. 1978 65 p refs In GERMAN; ENGLISH summary

(Contract BMFT-WRT-69)
(BMFT-FB-W-78-11) Avail: NTIS HC A04/MF A01; Fachinformationszentrum, Eggenstein-Leopoldshafen, West Ger. DM 13.50

Results of studies and experimental investigations on methods of aerological measurement on board small rockets are reported. The development and construction of a system for position finding of a fast moving object by the combination of a radiointerferometer for the direction finding and a device for the measurement of the distance via the time delay between signals transmitted from ground and retransmitted by a converter aboard the flying object is described. A study on a special kind of accelerometer, to be inserted in falling spheres or satellites for the measurement of air density, whereby a spherical body inside of the freely moving object is restrained by magnetic or electric forces, is presented. The construction of a functional model of the magnetic accelerometer is also discussed. A study on the possibility of the determination of the air density by measuring the Rayleigh scattering of artificial light is reported on. The development and construction of a barometer box with lids of metallic coated membranes of quartz glass forming a pressure sensitive condensor is summarized and the investigation of a pressure gage consisting of a gas discharge tube is outlined. (Contracts BMFT-WRK-0274; DFVLR-BPT-01-D1-173)
(BMFT-FB-W-78-16) Avail: NTIS HC A04/MF A01; Fachinformationszentrum Energie, Phys., Math., Eggenstein-Leopoldshafen, West Germany DM 13.45

The results of a foil cloud experiment executed during the National Aeronomy Program Winter Anomaly and Trace Constituents from December 1975 until February 1976 over El Arenosillo are reported. The experiment was flown on small rockets (SKUA 2 and SKUA 3). The experiment was designed for the measurement of the wind profile in the height region 80 to 95 km, providing a high resolution of height and yielding air density measurements. When the campaign results were compared with results of earlier measurements it was found that the sensitive levels, in which a change of wind speed correlates significantly with a change of short wave absorption are about 3 to 6 km higher under conditions of low sunspot activity than is the case when the sun's activity is high. However, the air pressure, derived from the fall rates of the foil cloud, does not change appreciably with the activity of the sun. Author (ESA)

PHYSICAL AND CHEMICAL PROPERTIES OF AEROSOLS UNDER VARYING EUROPEAN INFLUENCE
Jost Heintzenberg, Claes Traegaardh, G. Alm, R. Bostroem, L. Granat, H-C. Hansson (Lund. Inst. of Technol., Sweden), B. Holm, S. Moritz, A. Richter, and R. Soderlund 6 Feb. 1979 111 p refs Prepared in cooperation with Intern. Meteorol. Inst.
(AC-48) Avail: NTIS HC A06/MF A01

In a joint field experiment in Valen, southern Sweden, physical and chemical aerosol properties in air masses with varying degrees of contamination were measured. By means of trajectory calculations the aerosol properties were related to air mass in order to study the influence of different source regions. During the total time period a wide range of air masses passed over the station. Consequently aerosol properties varying by factors between 5 and 1000 were encountered. Maximum light scattering and light absorption occurred at the same time as maximum particle concentrations as well as NH4 and SO4 ionic concentrations. The corresponding trajectories clearly indicated the inflow of air as coming from southeastern or western Europe. For other elements the trajectory analysis pointed to maritime or local Scandinavian sources. Author (ESA)

PARAMETERIZATION OF VERTICAL DIFFUSION IN A DIURNALLY VARYING BOUNDARY LAYER
Gunnar Omstedt 12 Mar. 1979 21 p refs Prepared in cooperation with Intern. Meteorol. Inst.
(DM-27) Avail: NTIS HC A02/MF A01

A one-dimensional time-dependant diffusion model is used to represented a diurnally varying boundary layer. How such a variation affects the daily average vertical flux of a pollutant is studied. The model show that, independent of where the source is located (above or inside the boundary layer) a diurnal variation in the turbulent diffusivity profile makes the 24 hour average vertical flux less than the 24 hour average vertical flux computed with a constant turbulent diffusivity profile with the turbulent diffusivity given by its daily average. To assess this difference the concept of effective turbulent diffusivity is introduced. Author (ESA)

THE ATMOSPHERE BOUNDARY LAYER
R. W. Stewart 1979 58 p refs Presented at 3d Intern. Meteorol. Organ. (IMO) Lecture of the 7th WMO Congr., 1975
(WMO-523; ISBN-92-63-10523-5) Avail: NTIS HC A04/MF A01; WMO, Geneva SWFR 20

The definition of the atmospheric boundary layer is discussed. Its importance to the dynamics of the atmosphere is pointed out. The exchange of heat and water vapor between the earth's surface and the boundary layer is considered. Stable conditions and their consequences for the concentration of anthropogenic air pollution are examined. The theoretical treatment of the boundary layer, especially as regards mixing properties, is taken up. Various mathematical models, including eddy coefficient theory, similarity theories covering both the surface layer and theory above the surface layer, and closure models, are analyzed for their accuracy and efficiency. The properties of the lower boundary (land and water surfaces) are treated in greater detail and suggestions for further study are made. Author (ESA)

CARBON DIOXIDE AND THE GREENHOUSE EFFECT: AN UNRESOLVED PROBLEM
Irene Smith Apr. 1978 40 p refs
(ICTIS/ER-01; ISBN-92-9029-002-1) Avail: NTIS HC A03/MF A01

Current scientific literature concerned with the accumulation of carbon dioxide in the atmosphere is reviewed and evaluated. The extent and possible causes of natural variations in global climate are outlined as a background to potential variations due to human activity. Estimates are given on relative contributions of carbon dioxide to the atmosphere due to fossil fuel combustion, deforestation, and other land modifications. The possibility of a rise in global temperature as a result of increasing the amount

of carbon dioxide in the atmosphere is discussed including model predictions, natural factors which could compensate for or emphasize a warming effect, and the implications if extensive warming actually occurred. It is concluded that there is no evidence of a rise in global temperature due to carbon dioxide at present. An increase in the global temperature in the next century is considered in terms of an increase in precipitation rate and melting of all the ice sheets. Author (ESA)

THE EFFECT OF THE MAGNETOSPHERE PROCESSES ON THE IONOSPHERE DURING THE MAGNETIC STORM OF DECEMBER 1, 1977 BASED ON THE COSMOS-900 DATA
E. N. Sosnovets, V. V. Afonin, G. L. Gdalevich, A. V. Dronov, V. D. Ozerov, M. I. Panasyuk, L. V. Tverskaya, V. I. Tulupov, O. V. Korosheva, and J. Smilauer 1979 12 p refs
(D-277) Avail: NTIS HC A02/MF A01

The effect of the magnetospheric disturbances on the high latitude ionospheric plasma during the magnetic storm of December 1, 1977 was investigated using data from measurements onboard Cosmos 900 satellite. (The circular orbit is at the height of about 500 km, its inclination is 83 deg, the orbit period is 94.4.) The regions of energetic electron precipitation are correlated with auroras and with the intensity of protons forming the storm ring current, and the dynamics of the main ionospheric trough and the polar peaks of the density and the temperature of the ionospheric plasma are studied. EFFECTS OF PUMPING ON GROUND-WATER LEVELS NEAR, TAYLORSVILLE, BARTHOLOMEW COUNTY, INDIANA Final Water Resources Investigations.
Michael Planert and Patrick Tucci Feb. 1979 28 p refs
(PB-298244/5; USGS/WRD/WRI-79/018; USGS/WRI-79-20) Avail: NTIS HC A03/MF A01 CSCL 13B

A two-dimensional digital flow model was used to estimate the effects of continuous pumping of a public-supply well field on the ground-water levels near Taylorsville, Indiana. Results of the modeling showed that the water levels would decline from less than 1 to about 4.5 feet within the study area and a maximum of 1 to 2 feet in Taylorsville in response to a pumping rate of 700 gallons per minute. Model results also show that the groundwater system would reach steady state in approximately 5 years after pumping begins. Corrections applied to water-level declines indicated by the model, to account for the effects of partial penetration of the aquifer by wells, showed that these effects, although substantial in the pumping wells, are negligible 200 feet from the wells. CONVECTION INDUCED TEMPERATURE CHANGE IN GATE
Pamela G. Grube Feb. 1979 138 p refs
(Grants NSF ENV-77-10229; NSF ATM-78-01640)
(PB-298130/6; AS-Paper-305) Avail: NTIS HC A07/MF A01 CSCL 04A

An analysis is made of GATE B-array short time resolution (3-6 hours) upper tropospheric temperature and moisture changes. Convective patterns are examined to determine how deep-cumulus clouds are related to such upper level changes. Thermodynamic characteristics of a raining area are compared to those of a nonraining area. Information is obtained from the B-array rawinsonde, rain gauge, and weather radar products. The magnitude and time-scales of cumulus warming events are discussed as well as how cumulus warming may be related to tropical cyclone genesis. GRA

COMPARISON OF SPECTROSCOPIC AND RADIOMETRIC MEASUREMENTS OF UPPER ATMOSPHERE WATER VAPOR
Ira G. Nolt, James V. Radostitz, Russell J. Donnelly, and Lois P. Stearns May 1979 24 p refs Prepared in cooperation with Oregon Univ., Eugene
(PB-299072/9; NOAA-TR-ERL-406; APCL-44; NOAA-79071308) Avail: NTIS HC A02/MF A01 CSCL 04A

Simultaneous spectroscopic and radiometric measurements of atmospheric water vapor overburden are compared. The measurements taken during 15 flights indicated that both techniques give the same water vapor overburden to within 1 micrometer of precipitable water vapor. The median water vapor overburden is 6.5 micrometers precipitable water vapor at 41,000 ft (approx 180 mbar pressure) in the midlatitude western United States during the summer-fall season, with a range from 4 to 11 micrometers. WIND SHEAR HAZARD DEFINITION FOR A WIDE BODY JET Final Report
Herbert W. Schlickenmaier Jun. 1979 80 p ref
(FAA-RD-79-90) Avail: NTIS HC A05/MF A01

A computer program is developed to simulate the flight dynamics and automatic flight control system (AFCS) of a three engine jumbo jet following a 3 deg glideslope during final approach

Wind shear profiles representative of actual encounters are used. The simulation uses both autopilot and autothrottle. An initial effort is made to define specific wind shear conditions that pose hazards to aircraft. Parameter values are analyzed for each of four categorized wind shear environments and performance scores achieved on computer simulations are assigned for each of the four wind shear types. The most severe situations that can be accommodated by a jumbo tri-jet with current configuration are described for each of the four wind shear types. Conservative controllability criteria is applied and a hazardous condition is presumed to exist when the control action demanded and provided by the simulator exceeds the control limits of the actual aircraft, or when the airspeed and/or touchdown dispersion exceed limit values. Definition of these criteria provide a basis for the formulation of procedures allowing aircraft to anticipate and avoid hazardous wind shear conditions. A.R.H.

(NASA-CR-160359; NWC-TM-3667) Avail: NTIS
HC A03/MF A01 CSCL 04B

Results of airborne measurements of the sizes and concentrations of aerosol particles, ice nuclei, and cloud condensation nuclei that were taken at Kennedy Space Center, Florida, are presented along with a detailed description of the instrumentation and measuring capabilities of the University of Washington airborne measuring facility (Douglas B-23). Airborne measurements made at Ft. Collins, Colorado, and Little Rock, Arkansas, during the ferry of the B-23 are presented. The particle concentrations differed significantly between the clean air over Ft. Collins and the hazy air over Little Rock and Kennedy Space Center. The concentrations of cloud condensation nuclei over Kennedy Space Center were typical of polluted eastern seaboard air. Three different instruments were used to measure ice nuclei: one used filters to collect the particles, and the others used optical and acoustical methods to detect ice crystals grown in portable cloud chambers. A comparison of the ice nucleus counts, which are in good agreement, is presented. Author

A REPORT ON ATMOSPHERIC OBSTRUCTIONS TO VISIBILITY. VOLUME 1: STUDY RESULTS Final Report
Victor J. Lujetic. 10 Mar. 1979. 115 p.
(Contract DAAK70-78-C-0109)
(AD-A071741; RC168-001-Vol-1; ETL-0169) Avail: NTIS
HC A06/MF A01 CSCL 04/2

The aims and objectives of this report were to collect and assimilate information and synthesize data on the effects of atmospheric obstructions to visibility for the non-specialist. The following areas were addressed: A general discussion of the visible wavelengths, overall electromagnetic spectrum, radiometric and photometric quantities and concepts, and other visibility parameters. The human eye, nature of visibility, and the atmospheric effects on detection ranges. A description of those obstructions to visibility as listed in the Federal Meteorological Handbook on surface observations. A description of the primary visual instruments. The practicality of developing techniques that could be used to determine the effects of atmospheric obstructions on visibility and some typical charts and graphs, and. A summary of the extensive literature search performed. GRA

HC A04/MF A01 CSCL 04/2

This report covers a recently completed contract with the United States Air Force Air Weather Service to conduct research into the transfer of atmospheric energy in the visible and near-infrared portions of the electromagnetic spectrum. Its objective was to produce a spectral model of path transmittance, radiance, and groud-level irradiance that could be related to meteorological observations through the use of simultaneous, insitu data collections. For this purpose, a mathematical model was developed. It was based on physical equations for a homogeneous atmosphere that were modified by empirical observations made under a broad range of meteorological conditions. With the model, it is possible to estimate the visible and near-infrared spectral absorption and scattering phenomena that result from atmospheric constituents, from surface synoptic weather observations. The atmospheric model was coded into a computer program called SCAT3. This document is the fourth volume documenting the radiometric data collection program that culminated in the radiometric atmospheric model, SCAT3. The objective of this volume is to acquaint the user with the proper input sequences and options when SCAT3 is run on an IBM 370 computer. Volumes 1, 2, and 3 contain the details of data collection, analysis, and derivation of equations that were coded into the program to reconstruct atmospheric radiance, transmittance, and ground irradiation. SPECTRAL RADIOMETRIC MEASUREMENT AND ANALYSIS PROGRAM. VOLUME 1: DESCRIPTION OF MOBILE RADIOMETRIC LABORATORY SYSTEM Final Report

Lawrence G. Christensen, R. Simmons, G. Schauss, R. Norton, and R. Schoenfeld. Apr. 1979. 98 p.

(AD-A072078; AWS-TN-79-001-Vol-1) Avail: NTIS HC A05/MF A01 CSCL 04/2

This report covers a recently completed contract with the United States Air Force Air Weather Service to conduct research into the transfer of atmospheric energy in the visible and near-infrared portions of the electromagnetic spectrum. Its objective was to produce a spectral model of path transmittance, radiance, and ground-level irradiance that could be related to meteorological observations through the use of simultaneous, in-situ data collections. For data collection, a self-sustaining, mobile field radiometric laboratory was used that contained custom-designed spectroradiometers, mechanical/electrical servo controls, and computer interfaces; the laboratory utilized computer software for laboratory operation and data analysis. By means of minicomputers and peripherals, the laboratory produced calibrated and corrected data that could later be processed on larger, in-house IBM systems for development of the final radiometric model. This volume (No. 1) provides an engineering description of the mobile laboratory, the calibration of radiometers, and the computer software developed to operate the laboratory. More detailed documentation of devices and software is available upon request that will permit better understanding of the details of electronic, mechanical, and optical operation and maintenance of the laboratory system. This related system documentation is listed in Appendix A of this volume. Author (GRA)

MAJOR MIDWEST SNOWSTORMS

Eugene M. Weber. 8 Aug. 1979. 104 p. Supersedes Rept-3WW-TN-76-2-Rev.

(AD-A072746; Rept-3WW-TN-79-2; Rept-3WW-TN-76-2) Avail: NTIS HC A06/MF A01 CSCL 04/2

This Technical Note discusses the various atmospheric conditions essential to the development of major wintertime storm systems over the Midwest (Central United States). Primary emphasis is placed upon determination of areas favorable for cyclogenesis. Intensification and movement of the 500 mb low as a function of 500 mb height falls tendency is presented. Identification, intensification, and movement of the main surface system is then introduced. Finally, the related developments of all levels of the atmosphere, as they occurred, are shown in various summary forms. Author (GRA)

The advent of the geosynchronous satellite with 1 km resolution has presented meteorologists with the opportunity to routinely track and forecast smaller scale weather phenomena than hitherto was possible. The enormous data rate, however, precludes a completely manual system of data interpretation and forecasting, so to fully utilize this opportunity we must use computers. Following examples set by forecasters using digitized radar data, we are developing techniques to make guidance forecasts through automatic extrapolation of satellite imagery. Candidate techniques for extracting motion vectors from satellite imagery have been selected and programmed. This report describes the techniques and presents results of a preliminary test using simulated motions of selected satellite video images. GRA

DESIGN STUDY FOR THE DEVELOPMENT AND USE OF MODEL OUTPUT STATISTICS IN AUTOMATED AVIATION WEATHER FORECASTING Final Report, 1 Apr. 1976 - 30 Sep. 1978

Harry R. Glahn and Karl F. Hebenstreit. 1 Dec. 1978. 38 p. refs.

(AF Proj. 6670)

(AD-A072849; AFGL-TR-79-0002) Avail: NTIS HC A03/MF A01 CSCL 04/2

The Air Weather Service is preparing for the WWMCCS era by developing a support concept whereby weather information inputs will be in terms of Weather Impact Indicators (WIIs) which specify the probability that all stages of a mission will have 'favorable' weather. This report presents the design of a system based on the proven Model Output Statistics (MOS) approach to provide, in real-time, acceptably skillful objective estimates of WII probabilities. The system is mission oriented allowing the user to specify the limiting values for the weather elements which impact his mission. If forecast equations for such a mission profile are not already available in the system, forecast equations will be developed, applied, and archived for future use. Acceptable accuracy of these forecasts is essential. A user will not be satisfied with probabilities which, through poor reliability, lead to unexpected losses or which, through poor resolution, furnish little discrimination over and above a simple application of climatology. The design analysis for a real-time MOS system for global application shows such a system to be feasible within the resources of a large-scale computing center such as that operated by the National Oceanic and Atmospheric Administration or the Air Force Global Weather Central. GRA

COMPARISON OF THE FINITE ELEMENT AND FINITE DIFFERENCE METHODS IN A DIAGNOSTIC REGIONAL WIND FIELD MODEL M.S. Thesis

Daniel Joseph Rodriguez. May 1979. 97 p. refs.

(Contract W-7405-eng-48)

(UCRL-52789) Avail: NTIS HC A05/MF A01

A comparative study was undertaken to investigate the similarities and differences between the finite element and finite difference methods of numerically approximating an objective analysis equation. Both models are three-dimensional, time-independent, and incorporate terrain in adjusting a field of observed three-component velocities to achieve mass-consistency. Principles from the calculus of variations are utilized in developing model equations. The variational approach assumes that velocities

input to the models are a fair representation of actual mean winds. Starting with meteorological data available randomly on a regional scale, wind component values are interpolated and extrapolated to each grid point in the calculational domain in a manner consistent with prevailing meteorology. Model adjustments are made in response to the original mass-inconsistency in this field of discrete velocities and to the topographical boundary surface representing the application area. DOE

[REPORT OF ACTIVITIES ON WORLD METEOROLOGICAL RESEARCH, APPLICATIONS AND WATER RESOURCES DEVELOPMENT] Annual Report, 1978
1979. 236 p.
(WMO-529; ISBN-92-63-10529-4) Avail: NTIS HC A11/MF A01

Activities in such areas as water resources, agrometeorology and world food production, natural disasters and environmental problems of various kinds relating to weather modification, ozone depletion, atmospheric and marine pollution; and wind and solar energy are reported. The launching of the Global Weather Experiment is extensively covered. Meteorological applications in improving man's environment are emphasized. Progress made in hydrology and water resources development on regional and global levels along with the development programs of other organizations is discussed. A technical cooperation program through which assistance is rendered to developing countries is also summarized. Author (ESA)

REPORT OF THE FIFTEENTH SESSION OF THE JOINT ORGANIZING COMMITTEE Global Atmospheric Research Program Annual Report
1979. 184 p. refs. Conf. held at Dubrovnik, Yugoslavia, 28 Feb. - 6 Mar. 1979. Prepared jointly with ICSU, Rome.
Avail: NTIS HC A09/MF A01; WMO, Geneva SWFR 25

The status of the Global Experiment, the GARP climate dynamics subprogram, the World Climate Research Program, and other GARP subprograms is reported. Progress made by the Working Group on Numerical Experimentation is also cited. These activities cover such research areas as oceanography and climate, the carbon dioxide problem, climate modeling, the parameterization of extended cloudiness and radiation, as well as oceanic processes and observation of the world ocean. PLUVIOMETRIC DATA PRINTER [STAMPANTE DATI PLUVIOMETRIC]
Paolo Giorgi. Dec. 1978. 26 p. refs. In ITALIAN; In ITALIAN; ENGLISH summary.
(FUB-25-1978) Avail: NTIS HC A03/MF A01

A data printer of pluviometric data was developed in order to satisfy the requirements of a research project on the effects of rainfall on electromagnetic wave propagation above 10 GHz. The apparatus makes possible telemetric real time measurements, avoiding long processing delays. The characteristics of the logic circuits, power supply, and printer, are described. Author (ESA)

THE CALCULATION OF EVAPOTRANSPIRATION USING THE PENMAN FORMULA [TOEPASSINGEN VAN DE PENMAN FORMULE]
H. A. R. deBruin and W. Kohsiek. 1979. 57 p. refs. In DUTCH; ENGLISH summary.
(KNMI-WR-79-3) Avail: NTIS HC A04/MF A01

The application of the Penman equation for determining evapotranspiration, both for wet vegetation and for open surface water, is considered. Attention is payed to heat storage in the body of water, estimation of net radiation, and to the function describing the turbulent exchange in the atmosphere of water vapor and sensible heat. A brief error analysis is also given. The example of a crop surface is then treated. Results show that uncertainties in the wind function have a severe influence on the calculated evaporation. It is shown that uncertainties in the wind velocity at 2 m above a crop surface, derived from observations at neighboring meteorological stations, may lead to errors of up to 10% of the magnitude of the wind function. Finally, the effect of different averaging procedures on the water vapor pressure deficit is discussed. Author (ESA)

A CLIMATOLOGICAL STUDY ON THE OCCURRENCE OF EASTERLY GALES ON THE NORTH ATLANTIC OCEAN
C. G. Korevaar 1979 72 p refs
(KNMI-WR-79-5) Avail: NTIS HC A04/MF A01

The number of easterly gales that occurred in the North Atlantic Ocean north of 25 deg N were estimated using a selection criterion involving minimum values for the meridional pressure gradient for each day of the period 1881 to 1970. Looking at the number of days per year on which an easterly gale did occur it is seen that there are considerable differences between the successive periods 1881 to 1900, 1901 to 1920, 1921 to 1940, and 1941 to 1960. The fluctuations in the number of days per year with an easterly gale can be explained by a climatic fluctuation, connected by Willett with the cycle of solar activity, with a period of 80 to 90 years. This is in agreement with the fact that Schuurmans and Willett found the greatest increase in air pressure, after a solar flare, in the areas under consideration. It can be concluded that the occurrence of various numbers of easterly gales during the 80 to 90 year cycle of solar activity is a confirmation of the theories of Willett and Schuurmans. Results also show that next to influencing the frequency, the solar activity influences the persistence and extensiveness of easterly gales. Author (ESA)

VERIFICATION OF TWELVE AND 24 HOUR GEOSTROPHIC WIND FORECASTS AT 850 mbar USING BK3 AT IJMUIDEN OVER THE PERIOD OF 1 OCTOBER 1972 TO 30 NOVEMBER 1976 [VERIFICATIE VAN 12- EN 24 UURS GEOSTROFISCHE WINDVERWACHTINGEN OP 850 mbar VAN BK3 VOOR IJMUIDEN OVER DE PERIODE 1 OKTOBER 1972 T/M 30 NOVEMBER 1976]
L. C. Heijbor and G. W. Brouwer 1979 43 p refs In DUTCH; ENGLISH summary
(KNMI-WR-79-7) Avail: NTIS HC A03/MF A01

Verifications were carried out using geostrophic wind forecasts from an operational three-level quasi-geostrophic numerical model, BK3, and from the forecasts of the persistence. Contingency tables were composed for the forecasts of the wind speeds. With the aid of these tables the indices of the performance (relative performance of the model compared to the climatology) and skill scores (relative performance compared to the forecasted persistence) were computed. The forecasts of the wind directions were verified by taking the differences between the forecasted and observed directions and computing the mean differences and standard deviations for all chosen classes of forecasted wind speeds. Results show that the predictions of BK3 were better than those of the forecasted persistence. Author (ESA)

THE DYNAMICS OF EQUATORIAL MASS-FLOW ADJUSTMENT
Pedro Leite Silva Dias Jun. 1979 218 p refs
(Grants NSF ATM-76-09370; NSF ATM-78-08125)
(PB-297992/0; ATS/Paper-312) Avail: NTIS HC A10/MF A01 CSCL 04B

The problem of the adjustment of the mass and wind fields in a divergent barotropic model is solved on the equatorial beta-plane. It is also shown that the concept of an adjusted state on the beta-plane is dependent on the dispersive properties and energetics of Rossby and gravity waves. Two basic experiments are shown: the first is a perturbation in the geopotential field, and the second is a perturbation in the rotational part of the wind field. GRA

OBJECTIVE USE OF SATELLITE DATA DUE TO FORECAST CHANGES IN INTENSITY OF TROPICAL DISTURBANCES
Carl O. Erickson Apr. 1979 48 p refs
(PB-298915/0; NOAA-TM-NESS-103; NOAA-79070902) Avail: NTIS HC A03/MF A01 CSCL 04B

Eighty-nine classified and unclassified tropical disturbances of all intensities (several hundred synoptic 'cases') were investigated to determine how high-cloud vectors and other satellite data might be used for objective forecasts of changes in intensity. For unclassified (weak) disturbances, a 6-variable discriminator can identify many that are nondeveloping. For the remainder of unclassified disturbances, additional information is needed. For classified disturbances, two modified regression equations were developed to predict the 24 hr change in windspeed. The equations are derived from operationally available data, and the variables are calculated by a relatively simple numerical program. It appears that introduction of low-level vorticity and the nonlinear advection of vorticity should offer further improvements. GRA

NUMERICAL CASE STUDIES FOR OCEANIC THERMAL ANOMALIES WITH A DYNAMIC MODEL
Joseph Chi Kan Huang 1979 41 p refs Prepared in cooperation with Michigan Univ., Ann Arbor
(AD-A072587) Avail: NTIS HC A03/MF A01 CSCL 08/10

Numerical investigations to identify the physical processes responsible for the generation, evolution, and dissipation of oceanic thermal anomalies (OTA) were carried out using the numerical dynamic model of the North Pacific Experiment (NORPAX). The NORPAX model is based on time-integrations of the finite-difference forms of the primitive equations. It possesses an actual coastal configuration and 10 vertical layers, with a constant maximum depth of 4 km. The horizontal grid spacing, both longitudinal and latitudinal, is 2.5 deg. The seasonally varying model climatology is generated by integrating the model over 80 years of simulations under the climatological atmospheric forcing with the last 20 years varying with the seasonal cycle. Large-scale features of the model ocean climatology compare favorably with observed large-scale motions and structure in the North Pacific Ocean. The model is used for oceanic thermal anomaly studies. Two simulated cases are presented: one demonstrates the generation and evolution of OTA's under anomalous atmospheric wind forcing of winter 1949-50, and the other portrays the evolution and dissipation of the OTA's under climatological atmospheric conditions in winter 1971-72. GRA

LONG WAVE COUPLING OF THE MID AND SOUTH ATLANTIC BIGHTS FORCED BY THE ATMOSPHERE
David A. Brooks May 1979 131 p refs
(Contract N00014-77-C-0354; Grant NSF OCE-77-20971)
(AD-A072282; TAMU-Ref-79-3-T) Avail: NTIS HC A07/MF A01 CSCL 08/3

The eastern United States continental margin profile is relatively uniform throughout the Middle Atlantic Bight (Hatteras to Gulf of Maine), but in the South Atlantic Bight (Florida Keys to Hatteras) it bifurcates into an inner and outer slope region. Coastal tide gage records indicate that sea level oscillations with periods longer than one week can propagate southward as continental shelf waves in both Bights, thereby providing a coupling mechanism between the Bights. However, several-day period motions appear to be confined to the South Atlantic Bight and may result from backscattering of long wave energy by the variable topography and the Gulf Stream. The coastal sea level phase data for the several-day period motions is not easily attributable to a monochromatic propagating wave; rather, it appears that wave group properties may lead to a more consistent explanation of the phases. Cross-shelf and longshelf wind stress components were both strongly coupled to sea level fluctuations for long periods; short period motions were more closely associated with dynamic responses to atmospheric pressure fluctuations. BIOCHEMICAL STUDIES OF THE POTOMAC ESTUARY, SUMMER 1978
Joseph Lee Slayton and E. Ramona Trovato May 1979 42 p refs
(PB-297394/9; EPA-903/9-79-005) Avail: NTIS HC A03/MF A01 CSCL 08A

The carbonaceous and nitrogenous oxygen demand of Potomac River and STP effluent samples was determined during the summer of 1978. The oxygen depletion kinetics were studied during long term incubation using an inhibitor to nitrification. The average deoxygenation constants k sub e for the river sample CBOD and NOD were 0.12/day and 0.10/day, respectively. The CBOD of the Potomac STP effluent samples followed first order kinetics with an average k sub = e .16/day. The NOD for the STP effluent samples had a significant lag time resulting in poor correlation coefficients for first order fit. The average algal

contribution to the BOD5 was 0.027 mg/micrograms chlorophyll a with 70 percent due to decay and 30 percent due to respiration. GRA

ENVIRONMENTAL STUDIES OF THE SOUTH TEXAS CONTINENTAL SHELF, 1976 - 1977. HISTORICAL ZOOPLANKTON Final Report, 1977
E. Taisoo Park. Apr. 1979. 568 p. refs.
(PB-296646/3; BLM/YM/ES-79/06) Avail: NTIS HC A24/MF A01 CSCL 08A

Monthly samples taken off the South Texas coast between 1963 and 1965 were used to examine temporal and spatial variability in zooplankton populations. These data were compared to data from four stations on a previously examined transect in the same area. Seasonal peaks of density in the zooplankton and copepods generally occurred in the spring and fall, but seasonal and year to year variability was high. The dominant groups of zooplanktonic organisms included Copepoda, Larvacea, Mollusca, Euconchoecia, and Chaelognatha. Copepods generally comprised 50% to 65% of the zooplankton. Species diversity increased and density decreased with the distance from shore. GRA

THE 5-THIO-D-GLUCOSE THERMOREGULATORY EFFECTS IN MICE AT VARIOUS TEMPERATURES
Ralph P. Francesconi and Milton Mager. 14 May 1979. 24 p. refs.
(AD-A069511; USARIEM-M-12/79) Avail: NTIS HC A02/MF A01 CSCL 06/5

Adult, male mice were administered various doses of 5-thio-D-glucose (5-TG) at three environmental temperatures: 4 C, 22 C, and 35 C. Both intracerebroventricular (ICV) and intraperitoneal (IP) administration of 5-TG resulted in significant (p less than .05 to p less than .001) decreases in rectal temperature (Tre) which were usually dose-dependent. After 30 min the hypothermic effects were significantly (p less than .001, ICV, 100 microgram) exacerbated by cold exposure (4 C vs 22 C) and were likewise intensified significantly (p less than .005, 45 min, fed vs 18 hr fasted) by food deprivation. These decrements in rectal temperature (Tre) were accompanied by significant (p less than .001) increases in circulating levels of glucose. The present results indicate that 5-TG may be eliciting both central and peripheral cellular glucopenia concomitant with circulatory hyperglycemia; thus, the resultant hypothermia may be arising from competitive inhibition of glycolysis by 5-TG intermediates as well as reduced availability of tissue glucose. EARLY DIAGNOSIS OF DECOMPRESSION SICKNESS. CHANGES IN THE BLOOD FOUND SHORTLY AFTER DECOMPRESSION. EXPERIMENTS ON RATS
M. Wijnans, P. M. Draeck, and P. vanEck. Jul. 1978. 29 p. refs. In DUTCH; ENGLISH summary.
(MBL-1978-7) Avail: NTIS HC A03/MF A01

In rats subjected to compression followed by decompression hemoconcentration was observed. The effects were then related to the severity of the applied compression-decompression procedure. In nearly all cases this hemoconcentration became apparent before signs of decompression-sickness were observed. Hemoconcentration occurred even in rats without symptoms. In a relatively large number of rats a drop in platelet count was noticed soon after decompression; but usually only after the platelet count was corrected for the hemoconcentration. It was found that in rats a rise in hematocrit had the highest prognostic value for the occurrence of symptoms of decompression sickness. Recommendations are given for an investigation of the possible prognostic value of hemoconcentration in divers. Author (ESA)

DISCRETE MULTIVARIATE ANALYSIS ON RADIOBIOLOGICAL RESULTS FROM THE BIOSTACK 3 BACILLUS SUBTILIS EXPERIMENT
R. Facius, H. Buecker, and M. Schaefer. 1979. 6 p. refs. Presented at 22d COSPAR Plenary Meeting, Bangalore, India, May-Jun. 1979.
Avail: NTIS HC A02/MF A01

The dependency of spore survival on HZE particle linear energy transfer (LET) and on their distance from the particles trajectory during Biostack 3 experiments is discussed. Multivariate methods are applied as far as the stochastic point of view is concerned. It is shown that the major features of the bivariate results cannot be reduced to the heterogeneous frequency distributions of the respectively remaining physical parameters of the HZE particles. These findings bear on considerations about mechanisms, by which biological damage might be induced by high LET heavy ions. Author (ESA)

IDENTIFICATION OF CONTROLS IN NEURO-MUSCULOSKELETAL CONTROL SYSTEM MODELS
H. Hatze. Oct. 1978. 25 p. refs.
(CSIR-TWISK-52) Avail: NTIS HC A02/MF A01

The commonly adopted practice of identifying the myo-actuator torques in neuro-musculoskeletal control systems as the system controls is discussed. It is demonstrated that it leads to biologically unrealistic results. A systems model describing the excitation and contraction dynamics of skeletal muscle is then presented. In this model the control parameters are the actual neural controls, motor unit recruitment and stimulation frequency, and the model correctly predicts experimentally observed muscular force outputs for a wide variety of neural control inputs. A general myocybernetic performance criterion, and certain special cases pertaining to specific contractive modes are also discussed. R.E.S.

INTERSTIMULUS INTERVAL AS IT AFFECTS TEMPORARY THRESHOLD SHIFT IN SERIAL PRESENTATIONS OF LOUD TONES
Jerry V. Tobias. Jun. 1979. 10 p. refs.
(AD-A072006; FAA-AM-79-16) Avail: NTIS HC A02/MF A01 CSCL 06/16

Temporary threshold shifts were measured repeatedly during a session in order to determine effects of interstimulus interval (ISI) on the shift. The fatiguing sound was a 3 minute, 110 dB SPL, 4,000 Hz tone. Immediately following the 3 minute stimulation, Bekesy-audiometric tracings were made for 3 minutes at 5,656 Hz. Then the subject sat quietly for the ISI that was used during that session. The effect of the subject's rest time or time off was compared at two points on the recovery curve: at 30 seconds and at 2 minutes following the cessation of the fatiguing sound. For susceptible subjects tested with short-duration ISIs, each successive threshold showed a greater shift than the earlier ones for at least four tests. As ISI was increased, improvement seemed not to follow the expected linear form. At some critical value that varies from subject to subject, successive tests no longer differ from each other; each one is similar to a first trial in which no previous exposure to the high-level tone has occurred. For most subjects run under these conditions, the critical ISI value is at least 30 minutes. Author

HYPOTHERMIA INDUCED BY CHLORPROMAZINE OR L-TRYPTOPHAN EFFECTS ON TREADMILL PERFORMANCE IN THE HEAT
Ralph P. Francesconi and Milton Mager. 28 Mar. 1979. 21 p. refs.
(DA Proj. 3E1-61102-BS-08)
(AD-A069849; USARIEM-M-8/79) Avail: NTIS HC A02/MF A01 CSCL 06/19

To study the effects of preinduced hypothermia on the physiological and thermoregulatory responses to exercise in the heat, rats were intravenously administered 100 micrograms of chlorpromazine (Cpz) or 200 mg/kg of L-tryptophan (L-tryp) under restraint in a cold (4 C) environment. When rectal temperatures (Tre) reached 32-33 C, the rats were removed to a hot environment (35 C) where they ran on a level treadmill (9.14 m/min) to hyperthermic exhaustion (Tr - 42.5-43 C). Both Cpz and L-tryp hypothermia was effective in increasing significantly (p less than .001) the time to hyperthermic exhaustion. However, the maximal tre and skin temperatures (Tsk) attained were unaffected by either treatment. While exercising on the treadmill increments (C/min) in Tre and Tsk were significantly (p less than .02, minimal) greater for the initially hypothermic animals when compared to normothermic controls. Cooling rates were unaffected by either treatment. We concluded from these studies that while preinduced hypothermia is extremely effective in prolonging the time to hyperthermic exhaustion, no additional beneficial thermoregulatory responses accrued as a result of this treatment. COLD AIR INHALATION, ESOPHAGEAL TEMPERATURE LUNG FUNCTION IN EXERCISING HUMANS Final Report
J. J. Jaeger, E. Chandler Deal, Jr., D. E. Roberts, and E. R. McFadden, Jr. 14 Mar. 1979. 24 p. refs. Prepared in cooperation with Peter Bent Brigham Hospital, Boston, Mass. and Harvard Medical School, Boston, Mass.
(AD-A069510; USARIEM-M-7/79) Avail: NTIS HC A02/MF A01 CSCL 06/16

Eight normal individuals performed 10 min of bicycle exercise at 80% of their predicted maximum workload while breathing air at 22 C, saturated with water vapor and air at -40 C, dry. Rectal temperature and temperature at various locations along the length of the esophagus were measured during the exercise period. Pulmonary mechanics were measured before and 5 to 10 min after exercise. Temperature in the lower third of the esophagus was in close agreement with rectal temperature and was unaffected by level of respiratory heat exchange. Upper esophageal temperature decreased substantially during exercise, the magnitude of the decrease being dependent upon proximity to intrathoracic airways and the level of respiratory heat exchange. Subjects bronchodilated in response to exercise breathing warm air but this response was abolished by exercise breathing -40 C air. We conclude that at sufficiently high levels of respiratory heat exchange, normal individuals exhibit mild bronchoconstriction qualitatively similar to the severe bronchospasm induced in asthmatics by modest increases in respiratory heat exchange. A clinical grading system of severity of cutaneous burn was developed in a porcine cutaneous burn bioassay model using a flame thermal source. From surface appearance, color, sensation, tactile response, tenacity of hair anchoring, and appearance on cut section, a progression of the severity of burn injury was developed and documented with serial still photographs, high-speed cinephotomacrography and clinical descriptions. Variations in this grading scheme were required for skin protected or partially protected with fabrics, blackened with stove polish, or deprived of its circulation. GRA

CALCULATED LINEAR ENERGY TRANSFER SPECTRA OF HZE PARTICLES FOR THE FREE FLYER BIOSTACK EXPERIMENT ON THE LDEF-MISSION
W. Heinrich. 1979. 14 p. refs.
Avail: NTIS HC A02/MF A01

The LDEF-mission, scheduled for launch on the Space Shuttle in 1981, will fly for about nine months in a near earth orbit

with an inclination angle of 28. During this flight the Free Flyer Biostack experiment will measure biological effects of individual heavy ions from cosmic radiation. The corresponding results of a calculation of linear energy transfer (LET) spectra in free space and inside the experiment are presented. The calculation considers the geomagnetic shielding of the spacecraft against charged particles with low energies and the disintegration of the heavy ions inside the experiment by fragmentation. For this mission the LET spectra will differ significantly from those of previous experiments. Primary particles with high LET are scarce. Inside the experiment the LET spectra change with depth of matter due to the energy loss and fragmentation of the nuclei.

SUMMARY OF RADIOBIOLOGICAL FINDINGS: FROM SPACEFLIGHT TO GROUND-BASED STUDIES Annual Report
H. Buecker and R. Facius. 1979. 8 p. refs. Presented at 22d COSPAR Plenary Meeting, Bangalore, India, May/Jun. 1979.
Avail: NTIS. HC A02/MF A01.

Radiobiological studies relative to manned space flight are reviewed. The prediction of relevant physical parameters, radiation effects and space flight factors, late effects, and heavy effects are discussed. It is concluded that a reliable a priori assessment of the radiobiological risk from longer duration space missions remains as yet a difficult task. The fact that some symptoms of biological injury become manifest only long after exposure is pointed out.

PERFORMANCE, PHYSIOLOGICAL, AND OCULOMETER EVALUATION OF VTOL LANDING DISPLAYS Final Report
R. A. North, S. P. Stackhouse, and K. Graffunder. NASA. Sep. 1979. 160 p. refs.
(Contract NAS1-15081).
(NASA-CR-3171; HONEYWELL-F0584-FR1-1). Avail: NTIS. HC A08/MF A01. CSCL 05H.

A methodological approach to measuring workload was investigated for evaluation of new concepts in VTOL aircraft displays. Physiological, visual response, and conventional flight performance measures were recorded for landing approaches performed in the NASA Visual Motion Simulator (VMS). Three displays (two computer graphic and a conventional flight director), three crosswind amplitudes, and two motion base conditions (fixed vs. moving base) were tested in a factorial design. Multivariate discriminant functions were formed from flight performance and/or visual response variables. The flight performance variable discriminant showed maximum differentation between crosswind conditions. The visual response measure discriminant maximized differences between fixed vs. motion base conditions and experimental displays. Physiological variables were used to attempt to predict the discriminant function values for each subject/condition trial. The weights of the physiological variables in these equations showed agreement with previous studies. High muscle tension, light but irregular breathing patterns, and higher heart rate with low amplitude all produced higher scores on this scale and thus represent higher workload levels.

THE SCOPE, LIMITS, AND TRAINING IMPLICATIONS OF THREE MODELS OF AIRCRAFT PILOT EMERGENCY RESPONSE BEHAVIOR Research Report
Stuart E. Dreyfus and Hubert L. Dreyfus. Feb. 1979. 39 p. refs.
(Grant AF-AFOSR-3594-78; AF Proj. 2313).
(AD-A071320; ORC-79-2). Avail: NTIS. HC A03/MF A01. CSCL 05/9.

Three models of skill acquisition are proposed: (1) Nonsituational, (2) Intermediate, and (3) Situational. It is argued that only the third can account for highly skilled performance. The type of emergency training program each suggests and the level of pilot performance that each can be expected to produce is then investigated. We conclude that only training based on the situational model could possibly produce highly skilled emergency response behavior.

ROTARY WING PROFICIENCY-BASED AVIATOR SELECTION SYSTEM (PASS) Final Report, 15 Feb. 1977 - 1 Mar. 1978
Ruth Ann Marco, Richard F. Bull, Ronald L. Vidmar, and Brian D. Shipley, Jr. Jan. 1979. 244 p. refs.
(Contract DAHC19-77-C-0015; DA Proj. 2Q2-63743-A-722).
(AD-A069838; MDC-1839; ARI-TR-79-A2). Avail: NTIS. HC A11/MF A01. CSCL 05/9.

The Proficiency-Based Aviator Selection System (PASS) is the result of an operational feasibility program developed to determine whether a learning sample approach could be used to select candidates for rotary wing aviator training. PASS was based on the Automatic Pilot Aptitude Measurement System (APAMS), a five-hour learning sample of fixed wing piloting

tasks, developed for the Air Force Pilot Selection Program. PASS utilizes a UH-1 Flight Simulator (UH-1 FS) with a five-degree-of-freedom motion base to present the syllabus and test materials. the APAMS syllabus was extensively modified to conform to rotary wing flight operations, and the UH-1 FS software was reconfigured and formatted to meet the PASS requirements for training and performance measurement. Four voice synthesizers (VOTRAX) were interfaced to the UH-1 FS to provide vocal feedback. The operational capability of the PASS was demonstrated in a test with 11 experienced rotary wing pilots and 11 candidates for rotary wing training. The primary audience for this report will be operational personnel in training selection and simulation, particularly for rotary wing aircraft. GRA

INTELLIGENCE AS AN INFORMATION PROCESSING CONCEPT. Interim Report, 1 Apr. 1978 - 31 Mar. 1979.
Earl Hunt. May 1979. 91 p. refs. Presented at the Brit. Psychological Soc. Conf. Nottingham, Engl., Apr. 1979.
(Contract N00014-77-C-0225; NR Proj. 154-398; RR0420601)
(AD-A069953) Avail: NTIS. HC A05/MF A01. CSCL 05/10

This paper examines the relationship between general cognitive competence and several aspects of information processing. Three sources of individual differences in information processing are proposed: structure, strategy, and general attentional resources. Structural factors set limits on the effectiveness of specific information processing steps. These factors appear to be important when we contrast the cognitive capacities of extreme groups, such as normal and mentally retarded persons but they account for only a small amount of the variability in homogeneous groups such as college students. The reason may be that within such groups, strategy of attacking problems is a more important source of variation, and moderates the relationship between simple information processing steps and complex reasoning. Finally, the fact that scores on almost all measures of cognitive competence are positively correlated may be related to the fact that all mental processes seem to compete for general attentional resources, and that individuals differ in the attentional resources they can bring to bear on any cognitive task. DEVELOPMENT OF UNIT TRAINING AND EVALUATION TECHNIQUES FOR COMBAT-READY HELICOPTER PILOTS. TASK 2: ASSESSMENT OF ARTEP AND ATM TRAINING OBJECTIVES AND REQUIREMENTS FOR MAINTAINING OPERATIONAL READINESS. Research Note, 21 Sep. 1977 - 20 Sep. 1978.
Colin D. Ciley, Jr. and George E. Long. May 1979. 25 p. refs.
(Contract DAHC19-77-C-0059)
(AD-A069224; FTR-01-78; ARI-RN-79-11) Avail: NTIS. HC A02/MF A01. CSCL 05/9

The recently published Army Training and Evaluation Programs (ARTEP) and Aircrew Training Manuals (ATM) represent a new concept of Army aviation unit training. Commanders are now responsible for determining the training requirements of their individual units and for developing and implementing programs to meet those requirements. The ARTEP and ATMs were designed to assist the unit commanders in carrying out that responsibility. This report presents the results of a brief review of the utility of these documents in the field and the extent to which their content adequately represents the training objectives and requirements for maintaining combat readiness. The research concludes that the documents have been well received and are being utilized effectively by field commanders, that they contain a valid, though not entirely complete, reflection of combat-readiness training objectives and requirements, but, that the required recordkeeping is burdensome and there is a need for a more effective feedback system between its users and its developers. DEVELOPMENT OF UNIT TRAINING AND EVALUATION TECHNIQUES FOR COMBAT-READY HELICOPTER PILOTS. TASK 1: DEVELOPMENT OF AN INSTRUCTION PROGRAM FOR INDIVIDUAL AND UNIT TRAINING WITH COMBAT-READY PILOTS. Research Note, 21 Sep. 1977 - 20 Sep. 1978.
George E. Long, Colin D. Ciley, Jr., Rolk L. Jockenberger, and Ethlyn A. Garlich. May 1979. 86 p. refs.
(Contract DAHC19-77-C-0059; DA Proj. 2Q2-63743-A-772)
(AD-A069242; FTR-05-78-1; ARI-RN-79-10-1) Avail: NTIS. HC A05/MF A01. CSCL 05/9

The attainment and maintenance of combat readiness must be a, if not the, primary responsibility of every field unit commander. To carry out that responsibility, commanders of units with combat missions need training and evaluation techniques that will train pilots who already know how to fly to accomplish the requirements of a specific mission in a battlefield environment as part of the combined arms team. In order to provide the required techniques and procedures noted above, it is first necessary to derive an effective and efficient approach to their development. That approach should result in the availability of techniques and procedures that will facilitate the attainment of the highest level of combat readiness in the largest number of operational units in the shortest amount of time. This report describes the research effort directed at the derivation of an approach to the development of training and evaluation techniques and procedures for combat-readiness training that will meet the above noted requirements. It also describes the effort directed at the partial development of two training modules consistent with that approach. Author (GRA)

HUMAN FAILURE DETECTION AND RESOURCE ALLOCATION IN DYNAMIC ENVIRONMENT. Final Report, 1 Jul. 1977 - 31 Dec. 1978.
Christopher D. Wickens. Feb. 1979. 31 p. ref.
(Contract AF-AFOSR-3380-77; AF Proj. 2313)
(AD-A069821; EPL-79-2; AFOSR-79-0682TR) Avail: NTIS. HC A03/MF A01. CSCL 05/10

Three major areas of research are summarized: (1) Processing Resource allocation between tasks in dynamic environments. Results indicate that these abilities are distinctly limited. Rather than effectively allocating in response to task demand increases, the operator appears to temporarily 'expand' the capability of available processing resources. (2) Failure detection in dynamic systems. Human operators are found to be better at detecting failures (step transitions in the order of a dynamic system) when they are active participants in controlling those systems, than when they are passive monitors of the system under autopilot control. Some reasons for this difference are discussed, while research explores the role of training, and information processing channels in the detection process. (3) The attentional demands of failure detection. A model of human processing resources is described which partitions these resources into structure-specific reservoirs related to stages of processing. Task interference patterns between failure detection in the controlling vs. the autopilot monitoring mode, and between two qualitatively different loading tasks are shown to be consistent with this structure-specific resource view. LINEAR STATE FEEDBACK CONTROL OF RIGID-LINK MANIPULATORS.
David F. Golla. May 1979. 66 p. refs.
(UTIAS-TN-214; ISSN-0082-5263) Avail: NTIS. HC A04/MF A01.

Linear state variable feedback controllers were designed for rigid-link manipulator arms. Two types of feedback schemes were considered: general rigid control (GRC) which allows for both interjoint and intrajoint feedback, and independent joint control

(UC) which allows for only intrajoint feedback. The design scheme consisted of arbitrary closed loop pole placement. Pole assignment algorithms were developed for both GRC and UC feedback control schemes. Two controllers, UC and GRC, were designed for a preliminary two-link rigid model of the space shuttle manipulator arm carrying a full payload in planar motion. The two models are simulated and the controllers compared. R.E.S.

SPATIO-TEMPORAL INTERGRATION IN THE VISUAL SYSTEM. Final Technical Report, Aug. 1975 - Dec. 1977
Maier Algamor, Willard W. Farley, and Harry L. Snyder. Feb. 1979. 104 p. refs.
(Contract F33615-76-C-5022; AF Proj. 7184)
(AD-A069558; VPI-HFL-78-6; AMRL-TR-78-126) Avail: NTIS HC A06/MF A01 CSCL 05/10

A new model for temporal and spatial encoding in the visual system is developed and presented. Three series of experiments were conducted to validate the model. The experiments used (1) a TV display of random, dynamic noise, and (2) a specially designed stimulus generator which produces very large homogeneous visual fields which can be easily modulated to reproduce a large variety of temporal waveforms having a rise time longer than 1 ms. The obtained results support the proposed model. The principal findings are: (1) Time integration of the eye is locally controlled at the retina and has very fast dynamics. (2) The obtained CFF curves suggest a correlation between the frequency at which maximum sensitivity is obtained and the sensitivity itself. (3) As predicted by the model, temporal bands are developed in the visual system for stimuli showing temporal discontinuity points. The width of the temporal bands was measured and a strong correlation was found between the temporal band width and the integration time. The width of the temporal bands is a function of the luminance level of the bands; the width is not dependent on the stimulus slope. The apparent brightness of the temporal band is, however, dependent on the slope of the stimulus. GRA

HELMET-MOUNTED DISPLAYS: AN EXPERIMENTAL INVESTIGATION OF DISPLAY LUMINANCE AND CONTRAST
B. J. Cohen, J. R. Bloomfield, and K. J. McAlleese. Jul. 1979. 73 p. refs.
(Contract F33615-72-C-0420)
(AD-A072059; AMRL-TR-79-60) Avail: NTIS HC A04/MF A01 CSCL 14/2

This study was carried out in order to validate experimentally the predictions of previous analytic work (Cohen, 1973). The objective was to determine the best combination of filter coatings and display luminances required for viewing the Helmet Mounted Display (HMD) against a wide, but operationally realistic variety of background luminances. The predictions relating beamsplitter transmittance, visor transmittance and display luminance to performance were largely supported by the data. GRA

HELMET-MOUNTED DISPLAYS: A COMPUTER-ASSISTED ANALYSIS OF DAY-NIGHT VISUAL REQUIREMENTS
B. J. Cohen. Jul. 1979. 296 p. refs.
(Contract F33615-72-C-0420; AF Proj. 5973)
(AD-A072061; HONEYWELL-2079-SR5; AMRL-TR-79-62) Avail: NTIS HC A13/MF A01 CSCL 14/2

Honeywell has conducted a computer-assisted analysis in order to predict the range of ambient luminance conditions under which Helmet Mounted Display (HMD) imagery can be usefully resolved by an observer. This report examines those variables relating to ambient luminance, display luminance, and the attenuation of each in terms of optimizing display contrast minimizing differences in luminance to the two eyes. Visual performance predictions were made based upon comparing the analytically derived data with criteria values obtained from a limited number of technical reports. These criteria values were used even though it was recognized that the monocular see-through HMD is a unique system, thus limiting the applicability of data obtained from studies of related but still dissimilar systems such as head-up displays (HUDs) and occluded monocular HMDs. Among the factors affecting the quality of the displayed imagery, those variables most crucial to display luminance and contrast were systematically varied on a computer. GRA

THE ROLE OF THE UPPER FIELD OF VIEW IN SELECTED HMS/D VISUAL TASKS
B. J. Cohen and R. A. Levit. 12 Jul. 1979. 38 p. refs.
(Contract F33615-72-C-0420; AF Proj. 5973)
(AD-A072064; F4001-HSR1; AMRL-TR-79-65) Avail: NTIS HC A03/MF A01 CSCL 05/8

A study was conducted to determine whether opaque obstructions located in an observer's upper field of view would affect the visual detection of briefly illuminated targets located above his horizontal line of sight. Five versions of an acrylic visor considered for use with a helmet-mounted sight and display (HMS/D) contained one or more opaque areas located above their horizontal axes. Target detection performance for 12 subjects using the experimental visors was compared with the subjects' performance using an unobstructed control visor. Target appearance was signalled by a central cue light for six subjects (directed search), while the other six subjects were forced to rely only on peripheral detection of the briefly illuminated targets (undirected search). It was found that target detection performance was unaffected by either visor obstructions or by method of search, or any combination of the two. It was concluded that any of the visors would be usable from a visual performance standpoint. GRA

HELMET-MOUNTED SIGHT/DISPLAY PROGRAM: CESSNA 310 FLIGHT TEST
L. J. Mueller and B. A. Olson. 12 Jul. 1979. 84 p. refs.
(Contract F33615-72-C-0420)
(AD-A072058; F5517-HSR2; AMRL-TR-79-59) Avail: NTIS HC A05/MF A01 CSCL 05/8

The first phase of an engineering flight evaluation of operator performance with a Helmet-Mounted Sight/Display system has been completed. A total of 22 flights were conducted during which subjects utilized a helmet-mounted sight to control the pointing direction of a gimballed television camera and a helmet-mounted display to view the picture from the TV camera. Particular attention was paid to any indication of disorientation

or discomfort attributable to the helmet-mounted equipment. No significant effect was noted. Secondary investigations considered the effect of servo dynamics in the TV camera system, angular motion limits in the pointing system, display field for view, display brightness, and environmental factors including target complexity and contrast, ambient brightness, and atmospheric haze. Interaction between the ambient scene viewed directly and through the combining glass of the helmet display caused no difficulty during the experiment. A second phase of this study considered the potential for inducing vertigo through the use of helmet-mounted equipment. The test plan and preliminary results for this experiment are presented in an appendix to this report. A detailed report on Phase II will be issued later. GRA

HEAD AIMING/TRACKING ACCURACY IN A HELICOPTER ENVIRONMENT Final Report
Robert W. Verona, John C. Johnson, and Heber D. Jones. May 1979. 86 p.
(AD-A071359; USAARL-79-9) Avail: NTIS HC A05/MF A01 CSCL 05/8

This experiment was conducted to measure man's head aiming/tracking capability using a helmet mounted sighting device. The influences of target speed, helmet suspension types, and helmet weighting parameters on head aiming/tracking were investigated. If the aiming/tracking accuracy was sensitive to manipulation of these man-machine interface parameters, then it would seem to indicate that improved aiming/tracking accuracy could be obtained by improving the interface. The factors analyzed were eye dominance, helmet weighting, target speed, and helmet suspension. The eye dominance, helmet weighting, and target speed factors were statistically significant; however, the only factor of practical significance was target speed. A subject aiming at a static target with his head had an RMS error of about 3 milliradians. When the target began to move 4 degrees/second, the error increased to about 10.5 milliradians. When the subject began to vibrate, too, the error increased to 13 milliradians. When the target speed doubled, the vibrating error increased to 16.8 milliradians. GRA

This study addresses techniques for the design of automated support systems for naval management. It seeks to apply advanced computer techniques developed by the artificial intelligence community to real-world command environments. The managerial environment exhibits two major differences from most other application environments. First, the problems encountered by the manager are not routine or predictable. It is important that it be possible to tune the system to the actual needs as the problem develops. Second, the manager is the expert; he must be able to understand the system's behavior and the reasons for the actions it takes. In combination, these requirements indicate that the commander, or his delegate, should be able to modify or extend the system even though they may have little knowledge of programming or system design. The crucial design issue is to provide means by which the human user can exercise deep control without requiring a correspondingly deep knowledge of the system's implementation. The primary device we have exploited to provide the user with effective control is to base the design on the explicit encoding of the system's knowledge as a set of models each of which contains the constraints and goals that describe necessary relations in the information that describes the situation in a specified component of the application environment. These models remain available to the user for his study and modification. The implementation principles used to develop this design have been demonstrated in an experimental system called ACS.1 for automated command support. GRA

AN EXPERIMENT IN DISTRIBUTED INTERPRETATION
Victor R. Lesser (Mass. Univ.) and Lee D. Erman May 1979 52 p refs Prepared jointly with Mass. Univ., Amherst, and Carnegie-Mellon Univ., Pittsburgh
(Contracts DAHC15-72-C-0308; F44620-73-C-0074; Grant NSF MCS-78-04212; ARPA Order 2223)
(AD-A072558; ISI/RR-79-76; CMU-CS-79-120) Avail: NTIS HC A04/MF A01 CSCL 09/2

The range of application areas to which distributed processing has been applied is limited. In order to extend this range, new models for organizing distributed systems must be developed. We present a new model, in which the distributed system is able to function effectively even though processing nodes have inconsistent and incomplete views of the data bases necessary for their computations. This model differs from conventional approaches in its emphasis on dealing with distribution-caused uncertainty and errors in control, data, and algorithm as an integral part of the network problem-solving process. We show how this new model can be applied to the problem of distributed interpretation. Experimental results with an actual interpretation system support these ideas. GPA

WHAT WILL YOUR TIME SERIES ANALYSIS COMPUTER PACKAGE DO? COMPUTER PACKAGES
D. J. Pack 1978 35 p refs Presented at the IMS Special Topics Meeting on Time Series Analysis, Ames, Iowa, 1 May 1978
(Contract W-7405-eng-26)
(CONF-7805149-2) Avail: NTIS HC A03/MF A01

Packages relating to the ARIMA model building process and packages that are nonspectral are presented. The survey is segmented into general purpose standard statistical packages (BMDP, IMSL, SAS, SPSS), many method packages, and integrated ARIMA model building packages. Likely new directions are discussed. A number of concerns arise as a result of the survey, relating to the absence of time series capabilities in the standard statistical packages, the definition of an optimal method, the supply of computer packages from the academic to the business environment, and the degree of computerization appropriate for time series analysis. INFLUENCE OF MICROPROCESSOR TECHNOLOGY ON INSTRUMENT AND SYSTEM DESIGN
M. Ray Johnson 1979 18 p Presented at 8th IMEKO Congr., Moscow, 21 May 1979
(Contract EY-76-C-07-1570)
(CONF-790525-1) Avail: NTIS HC A02/MF A01

Current microprocessor technology as it relates to the design of instruments and instrumentation and control systems is surveyed. Representative applications of microprocessors are examined, including some implemented at the Idaho National Engineering Laboratory. Trends in LSI product capability, programming languages, standardization, and applications such as intelligent transducers and distributed processing systems are considered. DOE

N80-11797# Oak Ridge Y-12 Plant, Tenn.
MICROCOMPUTER-BASED VIDEO MOTION DETECTION SYSTEM
L. C. Howington 1979 8 p Presented at the Carnahan Conf. on Crime Countermeasures, Lexington, Ky., 16-18 May 1979
(Contract W-7405-eng-26)
(Y/DA-7999; Conf-790502-4) Avail: NTIS HC A02/MF A01

This system was developed to enhance the volumetric intrusion detection capability of the Oak Ridge Y-12 Plant's security program. Not only does the system exhibit an extended range of detection over present infrared, microwave, and ultrasonic devices, it also provides an instantaneous assessment capability by providing the operator with a closed-circuit television (CCTV) image of the alarm scene as soon as motion is detected. The system consists of a custom-built, microcomputer-based, video processor which analyzes the signals received from a network of video cameras. The operator can view the camera images as they are displayed on a CCTV monitor while alarm scenes are displayed on a second monitor. Motion is detected by digitizing and comparing successive video frames and making an alarm decision based on the degree of mismatch. DOE

BLACKOUTS AND BROWNOUTS AND THEIR EFFECT ON COMPUTER OPERATIONS
A. Peskin and C. Pittenger Sep. 1978 11 p refs Presented at the AESOP-SCIE Symp. on Advan. Computing, Las Vegas, Nev., 19 Oct. 1978
(Contract EY-76-C-02-0016)
(BNL-24960; Conf-781061-3) Avail: NTIS HC A02/MF A01

Reasons for blackout and brownouts and the sensitivity of computers to them are described. The sequence of events in one typical blackout is recalled. The effects of blackouts on computers are discussed. It is estimated that the total cost of blackouts at a busy installation could exceed several hundred thousand dollars a year. An uninterruptible power system (UPS) can provide temporary power when utility power is unavailable. A solid-state UPS typically has four sections: battery, inverter, rectifier/charger, and UPS bypass. The computer must experience a minimum disturbance of voltage wave forms and phase relationships during switching. Considerations in the design and installation of a UPS and associated equipment are discussed, safety aspects are included. DOE

A NORMATIVE COST-BENEFIT ANALYSIS OF THE SYSTEMATIC DESIGN METHODOLOGY
S. L. Huff May 1979 73 p refs
(Grant N00039-78-G-0160)
(AD-A072355; CISR-P010-7905-10; CISR-TR-10) Avail: NTIS HC A04/MF A01 CSCL 09/2

Complex design problems are characterized by a multitude of competing requirements. System designers, finding the scope of the problem beyond their conceptual abilities, frequently cope with this difficulty by decomposing the original design problem

into smaller, more manageable sub-problems. Functional requirements form a key interface between the system's users and its designers. This report proposes a systematic approach for the decomposition of the overall set of functional requirements into sub-problems to form a design structure that will exhibit the key characteristics of good design: strong coupling within sub-problems, and weak coupling between them. Recent work in the Systematic Design Methodology (SDM) project has led to certain extensions to the basic representational model. This report presents a normative cost-benefit analysis of the SDM. It is a decision support methodology for aiding a software designer in determining an optimal structuring of a system's functional requirements. A model-oriented, normative cost/benefit analysis of the SDM is presented. A set of three sub-models, pertaining to specification impact, procedural design impact, and maintenance/modification impact, are derived. These models attempt to capture, in functional form, the important quantifiable effects - both positive and negative - that ought to occur as a result of developing a system based on an optimal partitioning of requirements. A numerical example is included. GRA

VALIDATION OF SOFTWARE RELIABILITY MODELS Final Technical Report, Oct. 1977 - Nov. 1978
R. E. Schafer, J. E. Angus, J. F. Alter, and S. E. Emoto Jun. 1979 201 p refs
(Contract F30602-77-C-0219; AF Proj. 5581)
(AD-A072113; FR-78-16-1263) Avail: NTIS HC A11/MF A01 CSCL 09/2

This report presents the results of a study and investigation of software reliability models. In particular, the purpose was to investigate the statistical properties of selected software reliability models, including the statistical properties of the parameter estimates, and to investigate the goodness of fit of the models to actual software error data. The results indicate that the models fit poorly, generally due to in most part the vagaries of the data rather than shortcomings of the models. GRA

N80-11811# Air Force Aero Propulsion Lab., Wright-Patterson AFB, Ohio.
A FORTRAN ALGORITHM FOR PLOTTING CONTOURS OVER A TRIANGULAR MESH Final Report, Jul. - Dec. 1978
Kervyn D. Mach Jun. 1979 31 p refs
(AD-A072525; AFAPL-TR-79-2057) Avail: NTIS HC A03/MF A01 CSCL 09/2

This report describes a contour plotting algorithm for data distributed on a triangular mesh such as might occur from numerical solutions of partial differential equations over an irregular domain. The method of application is described and illustrated with examples. The algorithm requires considerable memory but very little execution time. Suggestions for reducing the memory requirements and a complete program listing are included. GRA

GRAFIT: A GENERALIZED GRAPHICS PACKAGE Interim Report
J. P. Boris, E. Dent, M. J. Fritts, I. Haber, and W. W. Jones 20 Jul. 1979 62 p
(RR0230101; RR0140302)
(AD-A072339; NRL-MR-4027) Avail: NTIS HC A04/MF A01 CSCL 09/2

This report is a concise user Manual for the GRAFIT package of subroutines. GRAFIT is a simple system for generating computer-graphics magnetic tapes for the Stromberg-Carlson 4020 microfilm recorder, on-line Calcomp incremental plotter, page-plot graphs, or Tektronix plots. The system is designed to be very efficient so using it to generate movies on 16mm film is relatively inexpensive. Appendices A, B, C, and D discuss the use of GRAFIT with consideration of the necessary control language and with an example of rather general utility. GRA

N80-11814# Yale Univ., New Haven, Conn. Dept. of Computer Science.
SCHEDULING PARALLEL PROCESSES WITHOUT A COMMON SCHEDULER Final Report
George Holober and Lawrence Synder Jul. 1979 16 p refs
(Contract N00014-75-C-0752)
(AD-A072158; TR-154) Avail: NTIS HC A02/MF A01 CSCL 09/2

An algorithm which solves the critical section problem for distributed processes is presented. We extend the solution of Lamport LL76 by continuing to allow processes to access their respective critical sections in any arbitrary user-specified order, but with greatly reduced storage requirements for each process. In addition, we supply a facility for testing the presence of deadlock among processes waiting to enter their critical code. We show our scheme to be tolerant of several malfunctioning processors and derive an equation relating the probability of total system failure to the probability of many individual failures occurring simultaneously among the processors. GRA

SPHEROIDAL FUNCTIONS. THEORETICAL STUDIES AND COMPUTATIONAL TECHNIQUES [PRESENTATION DES FONCTIONS SPHEROIDES: ETUDES THEORIQUES ET OUTILS DE CALCUL]
Paulette Dorio and Colette Soubry Mar. 1979 186 p refs In FRENCH, ENGLISH summary
(CNES-NT-88) Avail: NTIS HC A09/MF A01

The general properties of spheroidal wave functions and related work are reviewed. The formulas and algorithms necessary for the numerical evaluation of these functions on a CDC 7600 computer are also presented. Subjects discussed include the equations from which spheroidal wave functions are derived, approximations by other special functions, double orthogonality as regards the intervals (-1, +1) and (- infinity, + infinity), and the normalization coefficients with respect to the intervals. The eigenvalues of spheroidal wave functions are then given and it is shown that these functions form complete function bases on the intervals defined. The software developed using FORTRAN on a CDC 7600 computer is described and numerical results obtained are reported and compared with other published results. Results coincide to 12 and 14 significant figures. Author (ESA)

RAVAGE. A SUBROUTINE LIBRARY FOR COMPUTER GENERATION OF RANDOM NUMBERS, RANDOM VARIABLES, RANDOM VECTORS AND STOCHASTIC PROCESSES
Ion Vaduva (Bucharest Univ.) 1977 67 p refs
(SMD-Mitt-39) Avail: NTIS HC A04/MF A01

A subroutine library for computer generation of random variables, random vectors, stochastic processes, and other stochastic elements is presented. The subroutines selected and included in the library cover only the most important types of random variables, random vectors, and stochastic processes. Additions of other types of random elements to the library are discussed. The algorithms were collected from different books and papers which are given in the bibliography. FORTRAN was used for the coding. The statistical distributions used along with a short description of each subroutine and its auxiliary or preparatory subroutines are introduced. All subroutines are listed in the contents. Author (ESA)

CONTROL PROCEDURES IN PACKET SWITCHED COMPUTER NETWORKS: PART 2 [PROCEDURE DI CONTROLLO NELLE RETI A COMMUTAZIONE DI PACHETTO (PARTE SECONDA)]
Nicola Accarino, Maurizio Decina (Rome Univ.), and Claudio Rossi Aug. 1978 74 p In ITALIAN
(FUB-15-1978-Pt-2) Avail: NTIS HC A04/MF A01

The main control procedures used on packet switched networks are described. International regulations governing public networks are referred to in particular. Flow control at several hierarchic levels, window data flow control at levels n = 3 and n = 2, invariant and adoptive routing procedures, arithmetic

data flow control, and the efficiency of the various data flow control procedures are discussed. Author (ESA)

OPTIMAL FEEDBACK CONTROL LAWS USING RANDOM SAMPLING OF THE OBSERVATION
Yaakov Yavin Feb. 1979 29 p refs
(CSIR-TWISK-63) Avail: NTIS HC A03/MF A01

It is assumed that a control object is described by the system of nonlinear stochastic equations dx = >f(x) + v(z)<dt + sigma(x)dW, t > O, x, z epsilon R sub n, where W is a vector of independent standard Wiener processes and v is the control vector. It is further assumed that the process Z is observed, described by dz(i) = x(i)dN(i) + gamma (i) (x)dB(i), 1,...,n, x,z epsilon R sup n, where B = col. [B (1), ...B(n)] is a vector of independent standard Wiener processes and N = col. [N(1), ...,N(n)] is a vector of doubly stochastic Poisson processes with intensity [(lambda (1) Z (t), ..., lambda (n) Z (sub t), t > or equals O]. It is shown how the process N can be constructed, and for a given sampling process N, sufficient conditions are derived on optimal controls. In addition, the problem is dealt with in selecting an optimal sampling process N for a given admissible control law. Author

MINIMUM L-p-NORM CONTROLS FOR TIME-VARYING LINEAR DYNAMIC SYSTEMS
D. H. Jacobson Sep. 1978 12 p refs Sponsored in part by Control Data
(CSIR-TWISK-49) Avail: NTIS HC A02/MF A01

The problem is considered of determining a control function which derives a linear dynamic system from an initial state to a desired state in specified time and which minimizes the integral of a strictly convex, co-finite function of the control. Existence and uniqueness of the optimal control are proved under mild assumptions, considerably weaker than those in a related paper by Brockett. A constructive, globally convergent algorith is provided for computing the optimal control. Minimum L(p) norm controls are obtained for special choices of the performance functional integrand. CONTROL OF NONLINEAR SYSTEMS Progress Report, 1 May 1977 - 30 Sep. 1978
Allan E. Pearson 13 Oct. 1978 14 p refs
(Grant AF-AFOSR-2793-75)
(AD-A072635; AFOSR-78-1443TR; PR-3) Avail: NTIS HC A02/MF A01 CSCL 12/1

Results are summarized for the feedback stabilization of linear time varying differential and discrete-time linear systems, as well as a class of differential-delay systems. Extensions are described for a control law which tolerates a large class of nonlinearities in the loop without destroying stability. Research results are also described for the control of a class of intercept systems, including its interpretation as a commutative bilinear system, and a feedback control law, which incorporates least squares estimation of the target speed and turning rate. Results are described for parameter identification of a class of nonlinear systems, with particular attention given to the identification of parameters for a helicopter system in longitudinal motion, using input-output data on a finite time interval. Extensions to a signal estimation problem are indicated. GRA

MEASURE-VALUED PROCESSES IN THE CONTROL OF PARTIALLY-OBSERVABLE STOCHASTIC SYSTEMS Interim Report
Wendell H. Fleming Jun. 1979 30 p refs
(Grants AF-AFOSR-3063-77; NSF MCS-76-07261; AF Proj. 2304)
(AD-A072070; AFOSR-79-0849TR) Avail: NTIS HC A02/MF A01 CSCL 12/1

This paper is concerned with the optimal control of continuous-time Markov processes. The admissible control laws are based on white-noise corrupted observations of a function on the state processes. A 'separated' control problem is introduced, whose states are probability measures on the original state space. The original and separated control problems are related via the nonlinear filter equation. The existence of a minimum for the separated problem is established. Under more restrictive assumptions it is shown that the minimum expected cost for the separated problem equals the infimum of expected costs for the original problem with partially observed states. INFORMATION THEORETIC APPROXIMATIONS FOR M/G/1 AND G/G/1 QUEUING SYSTEMS Final Report
John E. Shore 18 Jul. 1979 40 p refs
(RR0140941)
(AD-A072338; NRL-MR-4047) Avail: NTIS HC A03/MF A01 CSCL 12/1

The behavior of single server queuing systems is characterized by various performance distributions, including distributions of queue length, waiting time, residence time, busy period, number served in a busy period, etc. In principle, if the arrival and service time distributions are known exactly, then these performance distributions can be computed using standard techniques. We consider the problem of estimating the distributions when only the first few moments of the service time distribution are known. Our approach uses standard relations to compute moments of the performance distributions from the known moments of the service time distribution and the principles of maximum entropy and minimum cross-entropy to estimate the performance distributions themselves. For M/G/1 systems with known average arrival rates, we derive analytic results for cases when one or two moments of the service time distribution are known, and we show how one can compute results using as many moments of the service time distribution as are available. For G/G/1 systems, our results are limited to the case in which only the average arrival and service rates are known. Among the results obtained with this information, theoretic approach is a new light-load approximation for the M/M/1 busy period probability density. Throughout the paper, we illustrate our approach using M/M/1, M/H2/1, and M/D/1 examples. GRA

QUANTITATIVE SYNTHESIS OF MULTIPLE LOOP FEEDBACK SYSTEMS WITH LARGE PLANT UNCERTAINTY Interim Report
Te-Shing Wang and Isaac Horowitz. Jun. 1979. 194 p. refs. (Contract AF-AFOSR-2946-76; AF Proj. 2304)
(AD-A072644; AFOSR-79-0880TR) Avail: NTIS HC A09/MF A01 CSCL 13/8

This work extends single input-output linear time invariant minimum-phase quantitative feedback synthesis to two new complex plant structures with internal sensing points. One is the triangular structure. The second consists of parallel branches, each with cascaded sections. Due to uncertainty, the plant parameters are elements of given sets. The system response must satisfy specified time or frequency domain tolerances. The basic problem is how to divide the feedback burden among the available loops so as to minimize the net rms effect at the plant input, of the various sensor noise sources. GRA

ON THE ACHIEVABLE ACCURACY IN STOCHASTIC CONTROL
P. E. Moden and T. Scederstroem. Apr. 1978. 37 p. refs. (Contract SWEDBTD-73-4381)
(UPTEC-78-23-R) Avail: NTIS HC A03/MF A01

Two ways of designing controllers for linear stochastic discrete time are compared. One method, ordinary linear quadratic control, means minimization of the expected value of quadratic forms. For the other method the expectation is taken conditionally on all old measured data. The weights on the quadratic forms are used as free design variables. It is shown that the use of ordinary linear quadratic control in general gives superior behavior for a closed loop system. The use of conditional expectation often gives reasonable results for systems with a positive real transfer function. For first order systems the same set of regulators can be obtained with both methods. The analysis is supported with numerical examples illustrating the results. Author (ESA)

ASPECTS OF A MULTI-CRITERION SECRETARY PROBLEM
T. J. Stewart. Sep. 1978. 29 p. refs.
(CSIR-TWISK-42) Avail: NTIS HC A03/MF A01

The selection of the most satisfactory from a random sequence of objects when these are evaluated according to a number of different criteria is presented. Various proposed methods of multi-criterion decision making are applied, and when evaluation is based on ranking only, procedures are very robust, and fairly simple. For the multi-criterion problem, however, ranking has the disadvantage that no allowance is made for differences in the range of options available for different attributes. On the other hand, rules based on measured values are difficult to implement. Such values can be used to determine criterion weights which can be incorporated into the rank-based procedures. M.M.M.

FUNCTIONAL SENSITIVITY FOR ORDINARY DIFFERENTIAL EQUATIONS
D. H. Martin. Jan. 1979. 46 p. refs.
(CSIR-TWISK-65) Avail: NTIS HC A03/MF A01

Systems of nonlinear ordinary differential equations in normal form, with prescribed initial 'state' x sub 0 and given time interval (t sub 0, t sub f) are considered. The sensitivity of the corresponding final state x sub f to arbitrary functional perturbations in the right-hand sides of the differential equations is addressed. It is assumed that a suitable Riemannian measure of distance between points in state space has been chosen, and in terms of this measure, a scalar function r(.), called the insensitivity function, is defined in a deleted neighborhood of x sub f. The behavior of this function characterizes the insensitivity of x sub f to finite functional perturbations to the right-hand sides of the differential equations. As the state x approaches x sub f in the direction of a vector Si, r squared (x) approaches a value which is the ratio of a positive definite quadratic form in Xi to the square of the Riemannian norm of Xi. The coefficients of this quadratic form, which are easily computed, define the insensitivity tensor at x sub f, and this provides a convenient description of the sensitivity of the final state in each direction. COLLECTIVE STATES AND CROSSING SYMMETRY
W. D. Heiss. Jan. 1979. 29 p. refs.
(CSIR-TWISK-58) Avail: NTIS HC A03/MF A01

Results are presented which were obtained with a model for the vertex function, such that crossing symmetry is implemented to lowest order. While in the model the vertex function obeys neither an s-channel nor a t-channel integral equation, it satisfies an equation in which the two channels are treated simultaneously and in a symmetric way. The s-channel and t-channel two particle propagators are calculated from the same vertex function. In comparison with the respective RPA-propagators the numerical results obtained within a schematic model show a remarkable effect at the higher levels of the respective energy spectra, while at the lower levels only the

residues of the propagators are strongly affected. The sum rules are satisfied to within + or -1%. The pole structure of the single-particle self-energy differs considerably from that which follows from the weak coupling approach. Author

COMPUTER GENERATION OF BIVARIATE GAMMA RANDOM VECTORS
Bruce W. Schmeiser and Ram Lal Jul. 1979 38 p refs
(Contract N00014-77-C-0425)
(AD-A072407; OR-79009) Avail: NTIS HC A03/MF A01 CSCL 12/1

The use of bivariate gamma distributions in simulation modeling is considered. A family of algorithms is given, any member of which can be used to generate random bivariate vectors having any gamma marginal distributions and any theoretically possible correlation, both positive and negative. Computational considerations are discussed, including the selection of parameters to provide regression curves consistent with the modeler's needs. A modification which is easier to implement and provides most, but not all, correlations is also given. Finally the use of these algorithms to generate first order autoregressive time series is discussed. GRA

METHOD OF MOMENTS AS THE LEAST SQUARES SOLUTION FOR FITTING A POLYNOMIAL
Fumiko Samejima and Philip Livingston 16 Jun. 1979 137 p refs
(Contract N00014-77-C-0360; RR0420401)
(AD-A072357; RR-79-2) Avail: NTIS HC A07/MF A01 CSCL 12/1

Methods of moments have been used frequently and effectively in our previous research for developing theories and methods of estimating the operating characteristics of the item response categories and ability distributions. It has been discovered that the method is quite useful, for fitting some curves to the set of observations, like maximum likelihood estimates, to the unobserved, conditional density function of which only the first few moments are estimated, and to the resultant, estimated density function of ability. It has also been discovered that polynomials are useful as functions to fit in applying the method of moments, with their unrestricted nature, regardless of the fact that there always is a possibility that they produce negative values for the estimated density. In the present paper, it is pointed out that a polynomial fitted by the method of moments is the same polynomial produced by the least squares principle. Using some examples, the two processes, i.e., the method of moments and the least squares solution, are compared. It is pointed out that, in general, the method of moments provides us with a simpler process and a more accurate result, than the least squares method, when the computer work is involved. The importance of using the appropriate interval in applying the method of moments, and the least squares method, is emphasized. GRA

AN APPROXIMATION TECHNIQUE FOR SMALL NOISE OPEN LOOP CONTROL PROBLEMS Interim Report
Charles J. Holland 1978 16 p refs
(Grant AF-AFOSR-3286-77; AF Proj. 2304)
(AD-A072638; AFOSR-78-1444TR) Avail: NTIS HC A02/MF A01 CSCL 12/1

This paper is concerned with the development of an approximation technique for the solution of a class of fixed stopping time small noise open loop control problems. These

problems arise by adding an additive white noise term with a small coefficient sq rt (2 epsilon) I to the system equations in the deterministic control problem. An approximation scheme is developed that has the advantage that one finds approximately optimal controls simultaneously for all sufficiently small epsilon. The scheme requires the solution of a generalized linear regulator problem which is solvable easily numerically. The numerical method is also presented. GRA

ON THE NUMERICAL SOLUTION OF CAUCHY INTEGRALS
Michele Napolitano Apr. 1978 17 p refs
(Contract CNR-77-0095)
Avail: NTIS HC A02/MF A01

The development of a reliable second order accurate Cauchy integral solver is discussed. The singular logarithmic behavior of the integral is extracted analytically and the residual regular function is numerically integrated by standard techniques. It is shown that simple trapezoidal rule integration leads to first order accurate behavior instead of to second order behavior as expected; such an anomaly is explained as due to the singular nature of the integrand. A general approach for obtaining consistent second order accuracy is presented and tested on linear airfoil integrals for which the exact solution is available. Also a vectorization of the logarithms, suitable for very efficient use within a complex iterative algorithm, is presented. Author (ESA)

ON BERRY-ESSEN RATES FOR STATISTICAL FUNCTIONS, WITH APPLICATION TO L-ESTIMATES
Dennis D. Boos and R. J. Serfling Apr. 1979 15 p refs
(Contract N00014-76-C-0608)
(AD-A072131; FSU-Statistics-M499; TR-136-ONR) Avail: NTIS HC A02/MF A01 CSCL 12/1

A parameter expressed as a functional T(F) of a distribution function (d.f.) F may be estimated by the statistical function T(F sub n) based on the sample d.f. F sub n. Typically, T(F sub n) is asymptotically normal. We investigate the rate of this convergence by utilizing the von Mises representation to express T(F sub n) - T (F) as an approximate U-statistic plus R sub n, and applying the Berry-Esseen rate O(sq rt n) established for U-statistics by Callaert and Janssen. This essentially reduces the problem to a handling of R sub n. We carry out this method for linear functions of order statistics (L-estimates) and obtain results competitive with Bjerve and Helmers. Also, we briefly indicate the application of the method to M-estimates. GRA

Blumenthal considered the problem of sequential estimation of the largest of k normal means when a bound is set on the acceptable mean square error. He showed that his procedure results in only a small savings in sample size when compared to a conservative fixed sample procedure for the case of known variance. Carroll criticized this procedure because it does not give the user the flexibility of sampling selectively from the k populations. Carroll defined a procedure which early in the experiment eliminates from further consideration those populations

which are obviously not associated with the largest mean and hence provide little relevant information; his theoretical large-sample calculations indicate possible large savings in sample size with no corresponding increase in mean square error. In this paper we contrast the small sample behavior of the two approaches by means of a Monte-Carlo simulation study; both known and unknown variance are considered. GRA

ON THE LENGTHS OF THE PIECES OF A STICK BROKEN AT RANDOM
Lars Holst (Uppsala Univ., Sweden). 21 May 1979. 22 p. refs
Prepared in cooperation with Goteborg Univ.
(CTH-Math-1979-13) Avail: NTIS HC A02/MF A01

The pieces of a randomly broken stick are considered. The length of the j the longest piece is determined and the exact distribution of the lengths is derived. It is noted that the analysis is particularly valid when the number of pieces is large. Also, moments of the lengths are obtained and some useful representations using independent exponential random variables are given. A necessary and sufficient condition for asymptotic normality is given and convergence of moments is obtained for linear combinations of length. The question of how many breaks are necessary to get all the pieces less than a certain length is also discussed. A limit distribution for the number of breaks is derived and convergence of moments is proved when the number tends to zero. The problem is also treated for the minimum number of arcs, having random length and placed at random on a circle of length one, needed in order to get complete coverage. Author (ESA)

REMAINDER TERM ESTIMATES IN ONE AND MANY-DIMENSIONAL RENEWAL THEORY
Hasse Carlsson. 1979. 61 p. refs
Avail: NTIS HC A04/MF A01

Let X1, X2, ... be d-dimensional independent radom vectors with a common distribution mu. Let nu = the summation of n = 0 to infinity mu exponent N* and, for d = 1, H(X) = NU (-infinity, X). The asymptotic behavior of NU (A + X) and H(X) as the absolute value of X tends to infinity are investigated. It is known that H(X) - X/mu sub 1 - mu sub 2/2 mu 1 to 2 tends to zero as X tends to + infinity if mu sub 1 > zero and mu is a non-lattice measure (mu sub k is the kth moment of mu). The rate of this convergence under further condition on mu is considered. The estimates are obtained by a Fourier transform technique making use of Bohr's inequality. The problem is also treated for d > or = Z. Author (ESA)

TREND-FREE BLOCK DESIGNS: EXISTENCE AND CONSTRUCTION RESULTS
Ching-Ming Yeh and Ralph A. Bradley. Jul. 1979. 30 p. refs
(Contracts N00014-76-C-0608; N00014-76-C-0394)

Designs for which treatment and block contrasts are orthogonal to specified common trend components within blocks have been called trend-free block designs. Necessary and sufficient conditions for the existence of such designs were given in a reference. A matrix sum was required to have certain properties. It is shown now that the existence of a matrix with the required properties assures the existence of the necessary component matrices. The existence of trend-free block designs for specified trends in one or more dimensions is examined in a number of theorems and corollaries. Initial results are general and then trends in one dimension are considered. An alternative formulation of the necessary and sufficient conditions for a trend-free block design is given when each treatment has the same number of replications. Some special results are obtained for complete and

balanced incomplete block designs. Youden Square designs are trend-free balanced incomplete block designs for up to p orthonormal, one-dimensional trend components, p - k, the block size. Some design construction methods are developed to establish the existence of certain trend-free block design. But, apart from the matter of treatment labelling, trend-free block designs may not be unique. The construction methods used may lead to designs particularly vulnerable to incorrect modelling of trend components. GRA

LIE-GROUP THEORY FOR SYMBOLIC INTEGRATION OF FIRST-ORDER DIFFERENTIAL EQUATIONS: A MODERN TREATMENT
W. A. Beyer. 1979. 35 p. refs. Presented at 2d MACSYMA Users Conf., Washington, D. C., 20 Jun. 1979.
(Contract W-7405-eng-36)
(LA-UR-79-251; Conf-790629-2) Avail: NTIS HC A03/MF A01

The application of Lie group theory to the solution of first order ordinary differential equations (ODEs) is reviewed. A code written in the MACSYMA language is presented which finds and solves first order DOEs invariant under group with infinitesimal generation of the form U = A(x)B(y)delta/sub x/ + C(x)D(y)delta/sub y/. An algorithm is given by which one can begin with an ODE y prime = f(x,y) with known solution phi(x,y) = c and obtain a possibly larger class of ODEs with solutions given in closed form. A final algorithm for forming a sequence of solvable differential equations is suggested. The work can be generalized to higher order differential equations, partial differential equations, and difference equations. DOE

A METHOD FOR PREDICTING THE NOISE LEVELS OF COANNULAR JETS WITH INVERTED VELOCITY PROFILES
James W. Russell. Washington NASA Oct. 1979. 156 p. refs.
(Contract NAS1-13500)
(NASA-CR-3176) Avail: NTIS HC A08/MF A01 CSCL 20A

A coannular jet was equated with a single stream equivalent jet with the same mass flow, energy, and thrust. The acoustic characteristics of the coannular jet were then related to the acoustic characteristics of the single jet. Forward flight effects were included by incorporating a forward exponent, a Doppler amplification factor, and a Strouhal frequency shift. Model test data, including 48 static cases and 22 wind tunnel cases, were used to evaluate the prediction method. For the static cases and the low forward velocity wind tunnel cases, the spectral mean square pressure correlation coefficients were generally greater than 90 percent, and the spectral sound pressure level standard deviation were generally less than 3 decibels. The correlation coefficient and the standard deviation were not affected by changes in equivalent jet velocity. Limitations of the prediction method are also presented. R.C.T.

STUDIES OF THE ACOUSTIC TRANSMISSION CHARACTERISTICS OF COAXIAL NOZZLES WITH INVERTED VELOCITY PROFILES, VOLUME 1 Final Report
P. D. Dean, M. Salikuddin, K. K. Ahuja, H. E. Plumblee, and P. Mungur. Cleveland, Ohio NASA May 1979. 186 p. refs.
(Contract NAS3-20797)

(NASA-CR-159698; LG79ER0178-Vol-1) Avail: NTIS HC A09/MF A01 CSCL 20A

The efficiency of internal noise radiation through coannular exhaust nozzle with an inverted velocity profile was studied. A preliminary investigation was first undertaken to: (1) define the test parameters which influence the internal noise radiation; (2) develop a test methodology which could realistically be used to examine the effects of the test parameters; (3) and to validate this methodology. The result was the choice of an acoustic impulse as the internal noise source in the in the jet nozzles. Noise transmission characteristics of a nozzle system were then investigated. In particular, the effects of fan nozzle convergence angle, core extention length to annulus height ratio, and flow Mach number and temperatures were studied. The results are presented as normalized directivity plots. R.C.T.

ACOUSTIC PHASE FLUCTUATIONS CAUSED BY GARRETT-MUNK INTERNAL WAVES

B. Hughes Mar. 1979 35 p refs

(AD-A071354; DREP-TM-79-1) Avail: NTIS HC A03/MF A01 CSCL 20/1

Perturbed acoustic propagation is considered between a point source and an array receiver in which the perturbations are due to a Garrett-Munk internal wave field. The resultant acoustic phase fluctuations along the array are determined. Straight ray propagation is assumed, and three array orientations are considered: broadside horizontal, end fire horizontal and broadside vertical. It is shown that for an acoustic frequency of 150 Hz, a range of 50 km and a horizontal broadside receiver separation distance (in the array) of 1 km, the rms phase difference between the two receivers at 1000 m depth in the N. Pacific is typically 5 deg, and in the Arctic it is typically 2 deg, whereas in the N. Atlantic at the same depth it is typically 50 deg. These geographical variations are due mainly to variations in the potential sound velocity gradient. Similar phase differences occur for a vertical receiver separation of 50 m. The horizontal receiver separation necessary to reduce the acoustic coherence to 0.5 for the same operating conditions is shown to be very large in the N. Pacific (about ~ 400 km) and Arctic (~ 1000 km), but only 2.3 km in the N. Atlantic. GRA

DEVELOPMENT AND EVALUATION OF AN EXPERIMENTAL PARAMETRIC ACOUSTIC RECEIVING ARRAY (PARRAY) Final Technical Report, 5 May 1976 - 31 Jan. 1978

Tommy G. Goldsberry, C. Richard Reeves, David F. Rohde, M. Ward Widener, Robert A. Lamb, Voldi E. Maki, Jr., and Wiley S. Olsen 16 Feb. 1979 154 p refs

(Contract N00039-76-C-0231; DARPA Order 2910)

(AD-A072307; ARL-TR-79-5) Avail: NTIS HC A08/MF A01 CSCL 17/1

The development, test, and evaluation of an experimental parametric acoustic receiving array (PARRAY) with a pump-hydrophone separation of 340 m are described in this report. Tests in Lake Travis, Texas, demonstrated a greater than 40 dB reduction in the self-noise floor of the experimental PARRAY compared to any previous parametric acoustic receiver. This reduction in the self-noise floor was achieved through state-of-the-art advances in four major hardware subsystems employed in the experimental PARRAY: high spectral purity pump signal generation; commensurate power amplification; high efficiency, high power transducer element and array design; and detection of sideband signals with very small modulation indices. Design and test results are presented for a crystal controlled oscillator with spectrum level single sideband phase noise less than -170 dB referenced to the carrier level. The design of a band elimination receiver preprocessor capable of detecting sideband signals approaching 180 dB below the carrier is presented and discussed. Test results are presented for simple, high efficiency transducer elements and arrays. Tests and experiments that were performed to evaluate the experimental 340 m PARRAY are described. GRA

ON THE DETERMINATION OF ARRIVAL TIMES FOR SOUND RANGING. 1: EFFECTS OF FINITE AMPLITUDE PROPAGATION, VERTICAL METEOROLOGICAL GRADIENTS, AND SYSTEM TRANSIENT RESPONSE

E. A. Dean May 1979 64 p refs

(Contract DAAG29-76-D-0100; DA Proj. 1L1-62111-AH-71)

(AD-A072600; ERADCOM/ASL-CR-79-0100-2) Avail: NTIS HC A04/MF A01 CSCL 17/1

Several factors bearing on the determination of arrival times in sound ranging are investigated. These factors include the propagation of a finite amplitude triangular shock wave, the diffraction due to the surface and the refraction due to the phase velocity increasing with height, and the effect of the microphone response. Corrections are derived for finite amplitude effects and refraction under a constant gradient for sound speed and wind speed. Recommendations for experimental studies to confirm this theoretical work are included. GRA

ON THE USE OF FINITE ELEMENT METHOD ON SOME ACOUSTICAL PROBLEMS

Leif Cederfelt 1979 95 p refs Original contains color illustrations

(Grant SWEDCBR-740095-5)

(D4-1979; ISBN-91-540-3009-9) Avail: NTIS HC A05/MF A01

The finite element method application on some acoustical problems is discussed in order to show the possibilities of the method. A brief description of the element formulation for air and beam elements is given and the technique of how to take boundary conditions into consideration and how internal losses are regarded is considered. The coupled beam-air system solution is made by iteration between two equation systems, one for the air and one for the beam elements. Applications such as sound attenuation of a right angle bend, a lined duct and an expansion chamber are described. The finite element method is also discussed in terms of costs and limitations. The method has its power for small geometries or low frequencies, that is, when analytical methods are usually weak. The more complex the geometry of a studied problem is, the more powerful the finite element method seems to be. Author (ESA)

SINGLE-ELECTRON CAPTURE INTO Ar + EXCITED STATES IN Ar + Na COLLISION BELOW 12 keV. 2: RELATIVE POPULATION DISTRIBUTED IN Ar + EXCITED STATES

Atsushi Matsumoto, Seiji Tsurubuchi, Kazuhiko Okuno, Shunsuke Ohtani, Tsuruji Iwai, and Yozaburo Kaneko Aug. 1979 29 p refs Sponsored by the Min. of Educ.

(IPPJ-411) Avail: NTIS HC A03/MF A01

Excitation cross-sections are obtained for each term of the ArII nl-states (nl = 4p, 4p' and 4d) at 4 and 8 keV. The relative population distribution among the terms of a given nl-state can be interpreted in terms of statistics based on the building-up

principle of molecule under radial coupling scheme. The relative population distribution among the multiplets in a given term is proportional to their statistical weight; spin-orbit recoupling at large internuclear separations is responsible for the population mechanism. The energy dependence of excitation cross-sections is discussed in connection with the Landau-Zener theory. Author

SPACE CHARGE LIMITED TRANSPORT AND BUNCHING OF NON K-V BEAMS
I. Haber. 25 Jul. 1979. 12 p. refs.
(AD-A072417; NRL-MR-4050) Avail: NTIS HC A02/MF A01 CSCL 20/8

Particle simulations are used to examine the behavior of an intense beam propagating down an alternate gradient focusing channel. In order to examine the dependence of emittance growth on the particle distribution function, an initially low current, non K-V, matched distribution is established. The current is then slowly increased as the beam propagates down the channel. Differences are observed in both the current at which emittance growth begins, and the rate at which the emittance grows, when the form of the initial distribution is changed. But this emittance growth still limits the intensity of the beam being transported. GRA

Techniques of ion photofragment spectroscopy have been used to investigate the structure and dissociation of molecular ions. For this research, a unique laser-ion coaxial beams spectrometer was constructed, allowing substantially improved sensitivity and resolution. The rare gas dimer ions were studied in detail, resulting in the determination of potential curves, absorption and photodissociation cross-sections, and photofragment angular distributions for these ions. Effects from spin-orbit coupling were found to be very important. The predissociation of the positive and negative ozone ions were investigated to obtain structural information about these ions. Very high resolution spectroscopy of the quartet states of the positive oxygen ion allowed a substantial improvement in these potential curves, as well as an improved determination of the bond dissociation energy of neutral oxygen. Photofragment spectroscopy of the positive ion of CH led to the observation of two predissociations, one in the singlet and one in the triplet system. Similar measurements on the positive ion of methyl iodide led to the resolution of rotational and fine structure levels in the previously observed predissociation of this ion. GRA

(LA-TR-78-36) Avail: NTIS HC A02/MF A01

A gas mixture of 1:100 BCl3 and Xe is blown against a cold plate to form a solid film. This sample is irradiated by a cw CO2 laser. After several hours of irradiation, it is found from infrared spectra that (B-11)Cl3 molecules are excited selectively and are educed on the cold plate as fine crystals. This phenomenon is considered to be due to laser-induced migration of (B-11)Cl3 molecules through Xe matrix. As Xe sublimates, (B-10)Cl3 molecules are released from the cold plate so that (B-11)Cl3 is enriched on the plate. The value of the separation factor obtained with 3.3 watt laser radiation is estimated to be 8.4. DOE

(AD-A072727) Avail: NTIS HC A02/MF A01 CSCL 07/4

Work under this contract is summarized. Results on collisional transfer of vibrational energy of gases and temperature dependence of transfer efficiency by the Diffusion Cloud method are described. New results by a novel and simple Variable Encounter Method for the study of vibrational energy transfer between gas molecules and a wall, at high temperatures and levels of activation, in the transient region are reported; cyclopropane and cyclobutane have been studied. ON THE COMPUTATION OF BOUNDS FOR LOW ENERGY COMPTON SCATTERING PARAMETERS: PROOF OF A CONJECTURE
G. Auberson and G. Mennessier. 1979. 16 p. refs.

(PM/79/7) Avail: NTIS HC A02/MF A01

A proof showing that the outer approximation results of a method proposed by Rasulier gives the optimal bounds for low energy scattering parameters as functions of the fixed transfer cross sections above the photoproduction threshold is shown. The Rasulier method was proposed to solve an extremum problem which arises in the derivation of dispersion inequalities for Compton scattering. A reduced mathematical form of the problem is stated after suitable changes of function (amplitudes) and conformal mapping of the energy plane. The proof is reached by making use of duality formulas in order to avoid the difficulties of dealing with spaces of analytical functions. Author (ESA)

TESTS OF STRONG, ELECTROMAGNETIC INTERACTIONS AND WEAK INTERACTIONS WITH POSITRON ELECTRON COLLISIONS

F. M. Renard. Mar. 1979. 62 p. refs. Presented at 10th Spring Symp. on High Energy Phys., Bermogruen, East Ger.

(PM/79/8) Avail: NTIS HC A04/MF A01

The use of electron-positron collisions for testing quantum electrodynamic hypothesis and for studying electromagnetic hadron structure is reviewed. The applications discussed include studies about the total cross section of hadron-forming electron-positron collisions, vector mesons, light u and d quarks, strange quarks, charm quarks, bottom quarks, the search for heavier quarks, multiparticle production of quark and gluon jets, the phenomenological parton jet model, and electromagnetic as well as weak interactions at high energy. DIRECT PHOTON EMISSION IN POSITRON ELECTRON ANNIHILATION PROCESSES

F. M. Renard. Apr. 1979. 12 p. refs. Presented at ECFA-LEP Working Group Meeting, Hamburg, 4-6 Apr. 1979

(PM/79/9) Avail: NTIS HC A02/MF A01

The reactions electron positron yields gamma + anything at very high energy are reviewed. The QED processes and their possible modifications by weak interactions are considered. The production of weak bosons is studied and their interest for testing the Yang-Mills couplings and checking the absence of any anomalous other couplings is shown. The case of electron positron yields gamma + hadrons is treated, the two processes: (1) radiation from initial spectral lines depending on the cross-section for electron positron yields hadrons at lower energies, and (2) central photon emission gamma or zeta yields gamma + hadrons expressed in terms of photon structure functions are examined. Their 'Born terms' are calculated, their interest for testing quark quantum numbers (charge, color) is noted. The possible use of photon spectra to search for exotic particles is also discussed. LIMITATIONS TO THE USE OF TWO-DIMENSIONAL THERMAL MODELING OF A NUCLEAR WASTE REPOSITORY

B. W. Davis. 4 Jan. 1979. 41 p. refs.

(Contract W-7405-eng-48)

(UCID-18101) Avail: NTIS HC A03/MF A01

Recent modeling studies show that the time-dependent temperature distribution of the waste emplacement media can be accurately modeled in the far-field using a 2-dimensional (2-D) planar numerical model; however, the near-field cannot be modeled accurately enough by either 2-D axisymmetric or 2-D planar numerical models for repositories in salt. The accuracy limits of 2-D modeling were defined by comparing results from 3-dimensional (3-D) TRUMP modeling with results from both 2-D Axisymmetric and 2-D planar. Both TRUMP and ADINAT were employed as modeling tools. Two-dimensional results from the finite element code, ADINAT were compared with 2-D results from the finite difference code, TRUMP; they showed almost perfect correspondence in the far-field. This result adds substantially to confidence in future use of ADINAT and its companion stress code ADINA for thermal stress analysis ADINAT was found to be somewhat sensitive to time step and mesh aspect ratio. INFORMAL CONFERENCE ON STATUS AND FUTURE OF SOLAR NEUTRINO RESEARCH; PROCEEDINGS

Gerhart Friedlander, ed. 1978. 272 p. refs. Conf. held in Upton, N.Y., 5-7 Jan. 1978

(Contract EY-76-C-02-0016)

(BNL-50879-Vol-2; Conf-780117-P2-Vol-2) Avail: NTIS HC A12/MF A01

Possible electronic methods and new theoretical approaches to the study of solar neutrinos are discussed in twelve papers. Topics covered include solar distortion; the possibility of a changing gravitational constant and of mixing in stars; the rotational history of the sun; nonradial oscillations of the nonstandard solar model; neutrino oscillations; and a critique of the chlorine-37 experiment. The round table discussion addressed the astronomical and cosmological implications of the various nonstandard models, future programs in laboratory experiments and theoretical calculations on reaction cross sections, opacities, convections, and observations of elemental abundances on the sun and the meteorites, and lastly the program in solar neutrino research. WIDE ANGLE OPTICAL SYSTEMS Patent Application

Fred Vicik, inventor (to NASA) (Barnes Engineering Co., Stamford, Conn.) Filed 19 Oct. 1979. 12 p. Sponsored by NASA

(NASA-Case-MSC-18373-1; US-Patent-Appl-SN-86508) Avail: NTIS HC A02/MF A01 CSCL 20F

A wide angle optical field flattening system for a multispectral scanner is described which provides a large field angles and high resolution at low f-numbers. The system utilizes a basic optical element in the form of a first flat surface of a reflecting element which directs a ray bundle to a second sperical reflection surface. The second spherical reflection surface reflects the bundle

to a field flattener coating on a third spherical surface located intermediate of the first flat surface and the second spherical surface. The third spherical surface forms an exit ray bundle on a flattened image plane with a lower f-number than that reflected from the field flattener coating. The exit ray bundle is passed through a coating to the image plane and to a sensing or scanning surface. NASA

INFRARED ABSORPTION BY WATER CLUSTERS Final Report, Aug. 1976 - Sep. 1978
Hugh R. Carlon. Mar. 1979. 47 p. refs.
(AD-A071455; AD-E410129; ARCSL-TR-79013) Avail: NTIS HC A03/MF A01 CSCL 20/6

This report summarizes the results of a two-year study of atmospheric infrared 'continuum' absorption attributed to intermolecularly bonded clusters in water vapor. Spectral data are reviewed for water vapor, steam and liquid water. The infrared continuum absorption is discussed in detail and is shown to be explicable on the basis of homogeneous or ion-induced cluster distributions in water vapor, where the cluster population is approximately proportional to the square of the partial water vapor pressure. Thermodynamic consistency between the vapor and liquid phases is discussed for temperatures including the critical (374 C) where the phases become one. Simple oscillator models are shown to give agreement with observed spectral lines, suggesting certain cluster configurations. The ion concentration of moist air versus temperature is discussed, and measurements of ion cluster distributions are considered. Cluster absorption at longer wavelengths including the microwave region is discussed. Conclusions are presented. GRA

INVESTIGATION OF A MULTIMODE FIBER OPTIC COUPLER Final Report, 1 Apr. - 31 Dec. 1978
Marvin D. Drake. 1979. 50 p. refs.
(Grant AF-AFOSR-3566-78; AF Proj. 2305)
(AD-A071874; AFOSR-79-0859TR) Avail: NTIS HC A04/MF A01 CSCL 20/6

The operation of a three-fiber multimode fiber optic coupler was experimentally investigated for the dependence of the forward coupling ratio upon surface conditions of the aligning rods, stress on the fibers, length of the aligning rods, mode distribution in the main fiber, make of fiber, and length of input fiber. An explanation of the discrepancies between theory and experiment was also sought. The forward coupling was found to increase for gross perturbations of the surface of the alignment rods, increase for increased stress on the fibers, increase with length of the aligning rods, increase with increasing number of higher order modes, depend strongly on type of fiber, and decrease with input fiber length. Further, the directivity of the coupler was increased greatly by reducing reflections from the ends of the fibers. GRA

WAVEGUIDE STUDIES FOR FIBER OPTIC SOURCES Interim Report
Elsa Garmire. Griffiss AFB, N. Y. RADC. Jun. 1979. 69 p. refs.
(Contract F19628-77-C-0221; AF Proj. 2306)
(AD-A071446; RADC-TR-79-112) Avail: NTIS HC A04/MF A01 CSCL 20/6

Methods for multimode optical beam expansion, deflection, and switching are discussed in connection with fiber optic and optical signal processing applications. The feasibility of using negative waveguide lenses as beam expanders for stripe-geometry lasers is demonstrated. A monolithically integrated laser source and beam expander is designed utilizing planar epitaxy and selective chemical etches. Epilayer designs for optical coupling of light from the laser region to the waveguide are discussed. Grating distributed Bragg deflectors are fabricated, and the beam expansion from them is characterized. The use of electrical feedback is produce bistability in an optical switch in both bulk $LiNbO_3$ and $LiNbO_3$ waveguides is demonstrated, and the transient response of these hybrid bistable optical devices is investigated. Theoretical predictions of the dependence of switching time on applied light increment are confirmed. GRA

[ACTIVITIES REPORT OF THE IMAGE LABORATORY] Annual Report, 1976 [COMPTE-RENDU D'ACTIVITE]
Jan. 1979 39 p refs In FRENCH; ENGLISH summary
(ENST-D-79005) Avail: NTIS HC A03/MF A01

Hybrid numerical, optical, and video image processing is reported. Research projects include image modelization aimed at describing stationary zones (textures) and nonstationary characteristics (contours). This theoretical study was applied to television and visiophone pictures as well as to numerical image processing (contour detection algorithms). Image pattern recognition work comprised the optimization of optical filtering methods. This technique was implemented numerically and a machine was tested for the blind. As examples of numerical synthesis of optical filters and numerical analysis of optical processing, biomedical applications and scene analysis through complex filtering are cited. Author (ESA)

DIRECT COMPARISON BETWEEN CIRCULARLY AND LINEARLY POLARIZED RF FIELD IN ICRF HEATING OF A TOROIDAL PLASMA
Yasuyoshi Yasaka and Ryohei Itatani Aug. 1979 34 p refs
(IPPJ-416) Avail: NTIS HC A03/MF A01

ICRF heating of a toroidal plasma is performed using slow waves generated by the m = +1 circularly polarized rf field and the m = + or - 1 linearly polarized rf field which is, in general, conventionally employed. From direct comparison between the two field-modes on wave generation, ion heating efficiency, and enhanced plasma loss, it is revealed that the circularly polarized field is far more effective than the linearly polarized field in both achieving higher heating efficiency and reducing enhanced plasma loss. The ion heating by the linearly polarized field is accompanied with the enhanced cross-field plasma loss, which may be qualitatively explained by the ion convection resulting from the ponderomotive force of the applied RF field. ARGON/UF6 PLASMA EXHAUST GAS RECONSTITUTION EXPERIMENTS USING PREHEATED FLUORINE AND ON-LINE DIAGNOSTICS
Ward C. Roman Oct. 1979 79 p refs
(Contract NAS1-14329)
(NASA-CR-159158) Avail: NTIS HC A05/MF A01 CSCL 20I

The feasibility of employing a flowing, high-temperature, pure fluorine/UF6 regeneration system to efficiently convert a large fraction of the effluent plasma exhaust back to pure UF6 was demonstrated. The custom built T.O.F. mass spectrometer sampling system permitted on-line measurements of the UF6 concentration at different locations in the exhaust system. Negligible amounts (< 100 ppm) of UF6 were detected in the axial bypass exhaust duct and the exhaust ducts downstream of the cryogenic trap system used to collect the UF6, thus verifying the overall system efficiency over a range of operating conditions. Use of a porous Monel duct as part of the exhaust duct system, including provision for injection of pure fluorine, provided a viable technique to eliminate uranium compound residue on the inside surface of the exhaust ducts. Typical uranium compound mass deposition per unit area of duct was 2 micron g/sq cm. This porous duct technique is directly applicable to future uranium compound transfer exhaust systems. Throughout these experiments, additional basic data on the corrosion aspects of hot, pressurized UF6/fluorine were also accumulated. A.R.H.

THE OSCILLATING TWO STREAM AND PARAMETRIC DECAY INSTABILITIES IN A WEAKLY MAGNETIZED PLASMA
H. P. Freund and K. Papadoupoulos 23 Jul. 1979 33 p refs
(AD-A072396; NRL-MR-4042) Avail: NTIS HC A03/MF A01 CSCL 20/9

We consider the effects of a weak ambient magnetic field on the oscillating two stream and parametric decay instabilities, with particular emphasis on the dependence on the angular variation of the instability thresholds and growth rates on the magnetic field. A dispersion relation is derived in the limit in which omega sub e > Omega sub e (where omega sub e and Omega sub e are the electron plasma and cyclotron frequencies respectively), and is solved for dipole and monochromatic pump spectra. The analysis shows that the presence of a magnetic field can substantially enhance thresholds and reduce growth rates for waves propagating at an oblique angle with respect to the magnetic field and (k lambda sub e)-squared approximately = (Omega sub e/omega sub e)-squared (where k is the wavevector of the perturbation and lambda sub e the Debye length). Thus, the magnetic field has a stabilizing influence on the off-parallel propagating modes. GRA

CONTINUOUS DOUBLE ADIABATIC SPECTRUM IN A PLASMA CONFINED IN A POLOIDAL MAGNETIC FIELD. Research and Training Programme on Controlled Thermonuclear Fusion and Plasma Physics (EUR-NE)
T. Hellsten. Feb. 1979. 18 p. refs. Sponsored by EURATOM.
(TRITA-PFU-79-02) Avail: NTIS. HC A02/MF A01
The continuous spectrum of an anisotropic toroidal plasma confined in a poloidal magnetic field is investigated with the double adiabatic theory. The continuous spectrum is given by an eigenvalue problem of two uncoupled second order ordinary differential equations. Results show that in contrast to the magnetohydrodynamic continuum the double adiabatic continuum may become unstable. The stability depends upon the perpendicular and parallel pressure distributions along the field lines. Author (ESA)

MEASUREMENTS OF ELECTRON DENSITY AND TEMPERATURE PROFILES IN A GAS BLANKET EXPERIMENT. Research and Training Programme on Controlled Thermonuclear Fusion and Plasma Physics (EUR-NE)
A. Kuthy. Feb. 1979. 28 p. refs. Sponsored by EURATOM.
(TRITA-PFU-79-03) Avail: NTIS. HC A03/MF A01
Radial profiles of electron density, temperature, and H beta intensity are presented for the rotating plasma device F-1. The hydrogen filling pressure, the average magnetic field strength at the midplane, and the power input to the discharge were varied in the ranges 10 to 100 mTorr, 0.25 to 0.5 Tesla, and 0.1 to 1.5 MW, respectively. These experiments were performed in order to study the gas blanket (cold-mantle) state of the plasma. It is shown that a simple spectroscopic method can be used to derive the radial distribution of the electron temperature in such plasmas. The observed peak temperatures and densities are in agreement with earlier theoretical estimates. Author (ESA)

ON THE BALANCE EQUATION FOR ANGULAR MOMENTUM IN A PLASMA. [L'EQUAZIONE DI BILANCIO DEL MOMENTO DELLE QUANTITA' DI MOTO IN MECCANICA DEI PLASMI]
Giulio Mattei. 1978. 5 p. refs. In ITALIAN; ENGLISH summary. Presented at 4th Cong. Nazl. di Meccan. Teorica ed Appl., Florence, 25-28 Oct. 1978.
(Rept-1670) Avail: NTIS. HC A02/MF A01
The balance equation for angular momentum in a plasma described by the magnetohydrodynamic model is obtained. The equation is derived as a consequence of four factors. These are: (1) the related equation of continuity, (2) the equation of motion, (3) the symmetry of the mechanical stress tensor in the plasma, and (4) the fact that the electromagnetic force per unit volume in the plasma can be expressed as the divergence of a symmetric tensor, i.e. the Maxwell magnetic stress tensor in the plasma. ON THE EXISTENCE AND STABILITY OF TRAPPED LANGMUIR MODES IN A DOUBLE LAYER
Christer Wahlberg Nov. 1978 46 p refs Sponsored by Swed. Nat. Sci. Res. Council Submitted for publication
(UPTEC-78-89-R) Avail: NTIS HC A03/MF A01

The stability problem of the double layer (electrostatic shock) is investigated using a simple model of the plasma. It is shown that local Penrose stability in general is insufficient for global stability due to the existence of linearly unstable trapped Langmuir modes in the density cavity. An additional requirement for stability is that the thickness of the layer must be smaller than a critical value, which in the case of a strong layer, and for the particular model being used, is shown. Various qualitative features of the instability mechanism are discussed in terms of normal mode coupling and quantitative results such as mode frequencies, growth rates, etc., are obtained by means of a conventional perturbation approach which in addition to the results expected from coupled mode theory also shows the existence of two purely decaying modes appearing for a sufficiently thin, stable layer. The double layer formation process is briefly commented on and some distinguishing features of the instability in this regard are pointed out. Author (ESA)

PARAMETER CALCULATION OF A SCREW-PINCH REACTOR WITH ELONGATED CROSS-SECTION
J. A. Hoekzema and W. Schuurman Apr. 1979 37 p refs Sponsored in part by Neth. Organ. for Pure Sci. Res. (SWO) and EURATOM
(Rept-79-117) Avail: NTIS HC A03/MF A01

In continuation of systems on screw-pinch reactors with a circular cross section, a parameter calculation was performed for a similar reactor with a chamber of rectangular shape. The duty cycle of the reactor comprises an implosion heating phase, an adiatatic compression of the plasma up to the ignition temperature, a phase of thermonuclear burn maintained by generated alpha particles, and a down-time for plasma cooling, pumping, and refuelling. Starting with a set of parameters that are mainly determined by expected technical limitatons, a zero dimensional, time dependent computer code is used to describe the various stages of the duty cycle. The physical model and the numerical method for this parameter calculation are described. It is found that severe ohmic losses limit the net efficiency to 20%. Therefore, it must be concluded that a screw-pinch reactor based on the assumptions of plasma heating by fast implosion and subsequent adiabatic compression, the use of resistive coils, an actively controlled value of beta and omittance of fuel injection, is not economically feasible. PROGRESS IN RINGBOOK 2, TORTUR 2 AND SPICA 2 FOR 1978 Annual Status Report, December 31, 1978
Apr. 1978 82 p refs Sponsored in part by EURATOM and Neth. Organ. for Pure Sci. Res. (ZWO)
Avail: NTIS HC A05/MF A01

Three plasma confinement experiments, RINGBOOG 2, TORTUR 2, and SPICA 2, are reported. The SPICA 2 design is evaluated in order to minimize stray magnetic fields and mechanical forces resulting from the gaps in the copper shell. An experiment is described which shows that the confinement of the heated plasma is affected by an influx of neutrals from the wall. The RINGBOOG 2 experiment is discussed. RINGBOOG 2 operates in the well established, high density, low temperature RINGBOOG 1 regime, under normal Tokamak operating conditions and in an intermediate, high density Tokamak mode without using gas puffing. Magnetohydrodynamic studies on the sharp boundary model of a high beta Tokamak are described. Author (ESA)

ON THE BOUNDARY LAYER BETWEEN A FLOWING PLASMA AND A MAGNETIC FIELD. PART 1. THE CONDITIONS FOR EQUILIBRIUM
L. R. O. Storey and L. Cairo Oct. 1978 65 p refs
(CRPE-NT-63-Pt-1) Avail: NTIS HC A04/MF A01

A qualitative study is made of a plane charge-neutral magnetopause separating a field-free plasma from a plasma-free magnetic fields, in the case where the plasma is flowing parallel to the applied field. It is shown that the existence of small-scale equilibrium depends on boundary conditions which are governed by the large-scale structure of the system. On certain conditions, which are defined, equilibrium is possible at all flow speeds. For a class of structures characterized by approximately axial flow, these conditions cannot be satisfied if the plasma encloses the magnetic field, but can if the magnetic field encloses the plasma. They are satisfied most naturally if, in addition, the magnetopause has the form of a torus. While intended originally as a contribution to magnetospheric physics, results may be more relevant to the high confinement of fusion plasmas. Author (ESA)

Singly rotated AT cut plates are most often used for frequency control in applications where moderate and high precision is required, but recent developments point to a greatly expanded role for doubly rotated cuts. Virtually all of these thickness mode cuts are of the form of thin circular discs mounted on their edges. Any forces communicated between the mounting supports and the quartz plate produce high stresses and stress-gradients resulting in significant frequency perturbations. This report describes crystal plate designs having a prescribed

lateral contour for singly and doubly rotated plates. These designs provide a relatively large portion of the periphery for mounting, such that mounting stresses are greatly reduced with no detriment to the force immunity of the older-type mounts. GRA

STUDY OF THE ELECTRONIC SURFACE STATES OF 3-V COMPOUNDS Semiannual Progress Report, 1 Oct. 1978 - 31 Mar. 1979
W. E. Spicer and I. Lindau 31 Mar. 1979 58 p refs
(Contract N00014-79-C-0072; DARPA Order 3564; NR Proj. 322-078)
(AD-A073014) Avail: NTIS HC A04/MF A01 CSCL 11/6

Although several theories of Schottky-barrier formation have been proposed, none has emerged as the correct general theory which elucidates the mechanism responsible for the barrier formation. Indeed, there may be no such general theory and, at the present time, it seems more appropriate to study limited classes of semiconductor materials. We have chosen the 3-5 compounds for both theoretical and practical reasons. The cleavage faces of GaAS, GaSb, and InP have the advantage that there are no intrinsic states in the band gap. This is in contrast to the more familiar column 4 semiconductors which do have intrinsic surface states in band gap upon cleaving. It was this concept of intrinsic semiconductor surface states in the gap which was used by Bardeen to explain Schottky-barrier formation on Si. However, the presence of these intrinsic surface states in the gap on the clean cleaved Si (111) surface does not rule out the possibility that other mechanisms may be responsible for surface Fermi energy stabilization after deposition of an overlayer. ELLIPSOMETRY OF ANODIC FILM GROWTH Ph.D. Thesis
Craig Gordon Smith Aug. 1978 360 p refs
(Contract W-7405-eng-48)
(LBL-8082) Avail: NTIS HC A16/MF A01

An automated computer interpretation of ellipsometer measurements of anodic film growth was developed. A multiple-film model was used to characterize the growth of films which proceeds via a dissolution-precipitation mechanism; the model also applies to film growth by adsorption and nulceation mechanisms. The characteristic parameters for film growth describe homogeneous and heterogeneous crystallization rates, film porosities and degree of hydration, and the supersaturation of ionic species in the electrolyte. Additional descriptions which may be chosen are patchwise film formation, nonstoichiometry of the anodic film, and statistical variations in the size and orientation of secondary crystals. Theories were developed to describe the optical effects of these processes. The growth in alkaline solution of anodic films on silver, cadmium, and zinc is discussed. DOE

THE EFFECT OF CRYSTAL GROWTH DIRECTION ON THE ENERGY RESOLUTION OF HIGH-PURITY GERMANIUM DETECTORS
G. Scott Hubbard, E. E. Haller, and W. L. Hansen Oct. 1978 7 p refs Presented at the IEEE Nucl. Sci. Symp., Washington, D.C., 18 Oct. 1978
(Contract W-7405-eng-48)
(LBL-8133; Conf-781033-32) Avail: NTIS HC A02/MF A01

Both [100] and [113] direction high-purity germanium crystals with dislocation densities > 10 to the 4th power/sq cm have been examined by Hall effect, Deep Level Transient Spectroscopy and gamma-ray spectrometer performance. High dislocation density [100] crystals appears to give rise to acceptor levels which cause broadened and/or asymmetric photopeaks. [113] crystals with EPD >10 to the 4th power/sq cm do not show these effects. DOE

ZONE CRYSTALLIZATION UNDER ZERO GRAVITY Final Report
Achim Eyer and Harald Zimmermann Bonn Bundesmin. fuer Forsch. u. Technol. Dec. 1977 191 p refs In GERMAN; ENGLISH summary
(Contracts BMFT-WRT-1072; GfW-01-E-0064)
(BMFT-FB-W-77-12) Avail: NTIS HC A09/MF A01; ZLDI, Munich DM 39.50

Based on theoretical considerations and after experimenting with several preliminary set-ups (using various radiation sources and focusing geometries), a zone crystallization apparatus was built. It is intended to serve as an experimental model to define the requirements for a SPACELAB version. The central part is a mirror furnace consisting of two adjoining rotary ellipsoids (half-axes a = 100 mm, b = C = 100 mm, volume 6 1), having one common focus. The sample rod to be crystallized is located in this focus while two halogen lamps as radiation sources are located in the other two foci. Approximately 95% of the radiation is focused. The (completely sealed) furnace can be operated under vacuum or a protective gas atmosphere. Temperatures up to 2000 C can be attained depending on the size and properties of the sample. Power consumption is extremely low as compared with conventional heating methods, especially if the very high heating and cooling rates are taken into account. Author (ESA)

DEMAND MANAGEMENT DEMONSTRATION PROJECT. STAGE 1: DEVELOPMENT OF RESIDENTIAL LOAD CHARACTERISTICS. STAGE 4: DEMONSTRATION OF RESIDENTIAL INCREMENTAL COST PRICING IMPLEMENTED BY TIME-OF-DAY METERING Final Report, Jan. 1979
Apr. 1979 144 p
(Contract EC-75-F-01-8072)
(HCP/B8072-01) Avail: NTIS HC A07/MF A01

Several load-management technologies were used in order to gather data necessary for further implementation, gain insight into customer reactions to the various techniques studied, and develop the computer codes necessary to process such data. The results are consistent with economic theory and will contribute to the further development of effective pricing structures for electricity. The customers on the time-of-day rate responded by reducing their peak-period consumption significantly below that of comparable control-group customers. Total energy use by customers in the pricing group declined about 3.5%. Customers in the time-of-use and radio-controlled groups reacted favorably to the techniques.

PERTURBATION METHOD ON THE STUDY OF THE INTERACTION OF THE SOLAR WIND WITH COMETS [METODO DE PERTURBACOES NO ESTUDO DA INTERACAO DO VENTO SOLAR COM COMETAS]
Rene A. Medrano-B. Jul. 1979 15 p refs In PORTUGUESE Presented at the 31st Reuniao Anual da Soc. Brasil. Para o Progr. da Cienc. (SBPC), 11-18 Jul. 1979 Revised
(INPE-1529-RPE/061) Avail: NTIS HC A02/MF A01

A hydrodynamic model as well as one in an interplanetary field B were used to study the solar wind-comet interactions. The problem was solved considering that energies in the B fields were smaller than energies of the solar wind at distances of IUA from the sun. An analysis on the balance of pressure at both sides of the shock waves indicate that the size of the fields where the noise is contained is considerably reduced. First order perturbation equations with a solution based on zero order restored the particles to 3 degrees of freedom.

(NASA-TM-79289) Avail: NTIS HC A02/MF A01 CSCL 05C

The directions that electric propulsion technology should take to meet the primary propulsion requirements for earth-orbital missions in the most cost effective manner are determined. The mission set requirements, state of the art electric propulsion technology and the baseline system characterized by it, adequacy of the baseline system to meet the mission set requirements, cost optimum electric propulsion system characteristics for the mission set, and sensitivities of mission costs and design points to system level electric propulsion parameters are discussed. The impact on overall costs than specific masses or costs of propulsion and power systems is evaluated. A.W.H.

84 LAW AND POLITICAL SCIENCE

Includes space law; international law; international cooperation; and patent policy.

N80-11951# Committee on Commerce, Science, and Transportation (U. S. Senate).
NASA AUTHORIZATION FOR FISCAL YEAR 1980
Washington GPO 1979 54 p Rept. on H.R. 1786 for the Comm. on Commerce, Sci., and Transportation, 96th Congr., 1st Sess., 11 Jun. 1979
(S-Rept-96-207; GPO-39-010) Avail: US Capitol, Senate Document Room

Budget requests for the fiscal year 1980 by National Aeronautics and Space Adminstration are presented. Appropriations for research and development, construction of facilities, and research and program management are discussed. A.W.H.

N80-11952# General Accounting Office, Washington, D. C. General Government Div.
PERSPECTIVES ON INTERGOVERNMENTAL POLICY AND FISCAL RELATIONS
28 Jun. 1979 52 p
(PB-297280/0; GGD-79-62) Avail: NTIS HC A04/MF A01 CSCL 05A

Intergovernmental policy and fiscal relations are examined. Relationships among Federal, state, and local governments are studied. Perspectives on intergovernmental issues and a forecast of future developments concerning ways to improve the intergovernmental management system are discussed. A.W.H.

85 URBAN TECHNOLOGY AND TRANSPORTATION

Includes applications of space technology to urban problems; technology transfer; technology assessment; and surface and mass transportation.

For related information see *03 Air Transportation and Safety*, *16 Space Transportation*, and *44 Energy Production and Conversion*.

N80-11953*# National Aeronautics and Space Administration, Washington, D. C.
SMALL TRANSPORT AIRCRAFT TECHNOLOGY. A REPORT FOR THE COMMITTEE ON COMMERCE, SCIENCE, AND TRANSPORTATION, UNITED STATES SENATE Interim Report
Oct 1979 77 p refs
(NASA-TM-80813) Avail: NTIS HC A05/MF A01 CSCL 05A

A preliminary assessment of the research and technology that NASA could undertake to improve small transport aircraft is presented. The advanced technologies currently under study for potential application to the small transport aircraft of the future are outlined. Background information on the commuter and shorthaul local service air carriers, the regulations pertaining to their aircraft and operations, and the overall airline system interface is included. A.R.H.

N80-11954*# Jet Propulsion Lab., Calif. Inst. of Tech., Pasadena.
A SURVEY OF ELECTRIC AND HYBRID VEHICLE SIMULATION PROGRAMS Final Report
J. Bevan, D. A. Heimburger, and M. A. Metcalfe Nov. 1978 110 p refs
(Contract EC-77-A-31-1011)
(NASA-CR-162457; HCP/M1011-04) Avail: NTIS HC A06/MF A01 CSCL 13F

Results of a survey conducted within the United States to determine the extent of development and capabilities of automotive performance simulation programs suitable for electric and hybrid vehicle studies are summarized. Altogether, 111 programs were identified as being in a usable state. The complexity of the existing programs spans a range from a page of simple desktop calculator instructions to 300,000 lines of a high-level programming language. The capability to simulate electric vehicles was most common, heat-engines second, and hybrid vehicles least common. Batch-operated programs are slightly more common than interactive ones, and one-third can be operated in either mode. The most commonly used language was FORTRAN, the language typically used by engineers. The higher-level simulation languages (e.g. SIMSCRIPT, GPSS, SIMULA) used by 'model builders' were conspicuously lacking. DOE

N80-11955# Oak Ridge National Lab., Tenn.
ADVANCED METHODS FOR THE TREATMENT OF DOMESTIC SEWAGE
A. L. Compere and W. L. Griffith 1978 29 p refs Presented at the 37th meeting of the Southeastern Assoc. for State Highway and Transp. Serv. Offic., Nashville, 21 Oct. 1978
(Contract W-7405-eng-26)
(CONF-7810108-1) Avail: NTIS HC A03/MF A01

Several methods for the treatment of domestic sewage which

are currently at the bench and large pilot stages of development, may be particularly applicable to state highway rest station problems, which often represent a practicable scale-up. Cross-flow filtration produces a high-quality effluent which might be suitable for lawn watering after disinfection. Anaerobic filter processes, either alone or in conjunction with a tertiary process such as ion exchange, may also provide adequate waste treatment for rest stop applications. DOE

N80-11956# General Electric Co., Schenectady, N. Y.
NEAR-TERM ELECTRIC VEHICLE PROGRAM: PHASE 2: MID-TERM SUMMARY REPORT
Aug. 1978 427 p
(Contracts EY-76-C-03-1213; EY-76-C-03-1294)
(SAN-1213-02; SAN-1294-02) Avail: NTIS
HC A19/MF A01

Developments in the areas of system analysis and design, subsystem analysis and design, and test and evaluation are reported. Significant technical accomplishments which are described include aerodynamic design and testing to achieve an extremely low-drag body design and development of a lightweight vehicle structure which will satisfy the current Federal Motor Vehicle Safety Standards. DOE

N80-11957# Kansas Univ., Lawrence. Dept. of Civil Engineering.
REMOVAL OF LAGOON EFFLUENT SUSPENDED SOLIDS BY A SLOW-ROCK FILTER Final Report, 1973 - 1975
Walter J. OBrien and Ross E. McKinney Jun. 1979 120 p refs
(Contract EPA-68-03-0280)
(PB-297454/1; EPA-600/2-79-011) Avail: NTIS
HC A06/MF A01 CSCL 13B

The removal of algae cells and other suspended solids contained in the effluents from facultative lagoons treating domestic wastewaters by means of rock filters is examined. The operating characteristics of the rock filter systems are presented and evaluated. Biological activity within the rock filter noted by the changes in dissolved oxygen concentrations is discussed. GRA

N80-11958# Culp/Wesner/Culp, Santa Ana, Calif.
WATER REUSE AND RECYCLING. VOLUME 1: EVALUATING
Apr. 1979 197 p
(OWRT Proj. R-0088(7804)(1))
(PB-297283/4; W79-07501; OWRT/RU-79-1) Avail: NTIS
HC A09/MF A01 CSCL 13B

Estimates of the potential for waste water reuse and recycling are presented. Information on water supply, water needs and availability, and waste water discharges is discussed. Existing and proposed waste water reuse facilities are reported. Water quality requirements are described for the following potential reusers of reclaimed waste water: agricultural irrigation, landscape irrigation, steam electric cooling, industrial cooling, and other industrial uses. GRA

N80-11959# Urban Inst., Washington, D.C.
DIRECTIONS TO IMPROVE URBAN TRAVEL DEMAND FORECASTING: CONFERENCE SUMMARY AND WHITE PAPERS Final Report
Louise E. Skinner, ed. 1978 411 p refs Conf. held in Washington, D. C., May 1978 Prepared in cooperation with DTM, Inc., Transport and Road Research Lab., Cambridge Systematics, Inc., Oklahoma Univ., S. G. Associates, Inc., sponsored by UMTA and FHWA
(Contracts DOT-FH-11-9386; DOT-FH-11-9387; DOT-FH-11-9389; DOT-8-3-0032)
(PB-297409/5; FHWA/PL-79/007) Avail: NTIS
HC A18/MF A01 CSCL 13B

Approaches and procedures for improving urban travel demand forecasting are studied. Areas of research examined are the application of time and money budgets to planning, increased understanding of location theory (land use, spatial perception, accessibility measures), development of multinomial supply models, and determination of the temporal and geographic stability of demand and supply models used in transportation planning. Data collection procedures in diary data and household interactions are discussed. A.W.H.

N80-11960# Massachusetts Inst. of Tech., Cambridge.
HYBRID OPTIMIZATION IN URBAN TRAFFIC NETWORKS Final Report, 13 Mar. 1978 - 14 Mar. 1979
Han-Ngee Tan, Stanley B. Gershwin, and Michael Athans Apr. 1979 123 p refs
(Contract DOT-TSC-1456)
(PB-297146/3; DOT-TSC-RSPA-79-7) Avail: NTIS
HC A06/MF A01 CSCL 13B

The hybrid optimization problem, a general theoretical framework for the analysis of a class of traffic control problems, is discussed. The role of individual drivers as independent decision makers is examined in relation to the problem. Different behavioral models for flow distribution are investigated. Necessary conditions for this problem are derived, and a physical interpretation of these conditions is provided. Possible directions for the development of algorithms applicable for solving large scale hybrid optimization problems are proposed. A procedure for computing the upper and lower bounds of the optimal cost of the hybrid optimization problem is outlined. A.W.H.

N80-11961# National Fertilizer Development Center, Muscle Shoals, Ala.
ECONOMICS OF DISPOSAL OF LIME/LIMESTONE SCRUBBING WASTES: SLUDGE/FLYASH BLENDING AND GYPSUM SYSTEMS Final Report, Jun. 1977 - May 1978
J. W. Barrier, H. L. Faucett, and L. J. Henson Feb. 1979 209 p refs
(PB-297946/6; BULL-Y-140; EPA-600/7-79-069) Avail: NTIS
HC A10/MF A01 CSCL 13B

Soil-like landfill material is produced without using purchased additives by blending separately collected flyash with dewatered flue gas desulfurization sludge from a limestone scrubbing system; and by air-oxidation modifications sulfate sludge (gypsum) which is dewatered and discarded without further treatment. Both processes are being developed; neither has been fully demonstrated. The sludge/flyash blending process had a higher capital investment ($36.40/kW) than the other (as well as untreated ponding and three of four chemical processes evaluated in an earlier study) primarily because of high electrostatic precipitator and process equipment costs; however, the process had lower annual revenue requirements (1.64 mills/kWh) than three of the four chemical processes. GRA

DEVELOPMENT OF AN EMERGENCY RESPONSE PROGRAM FOR TRANSPORTATION OF HAZARDOUS WASTE Final Report
1979 343 p
(Contract EPA-68-01-3973)
(PB-297438/4; EPA-530/SW-171C) Avail: NTIS
HC A15/MF A01 CSCL 13B

The problems associated with hazardous materials spills due to the anticipated increase in transportation of hazardous wastes are discussed. The capabilities of existing systems and an evaluation of their applicability to hazardous waste spills are presented. Federal and State regulations regarding spill notification, reporting requirements, and clean up procedures are reviewed. GRA

N80-11963# SCS Engineers, Reston, Va.
SAMPLING AND ANALYSIS OF THE AQUATIC ENVIRONMENT IN POTW'S AND THEIR VICINITY Final Report, 1977 - 1978
R. Carr, J. Erlandson, R. Greenspun (EPA, Wash., D. C.), M. Halper (EPA, Wash., D. C.), O. Mitz (EPA, Wash., D. C.), M. Neely (EPA, Wash., D. C.), P. Taylor, and G. Vogel 27 Jun. 1979 92 p refs Prepared in cooperation with Versar, Inc., Springfield, Va.
(Contracts EPA-68-01-4679; EPA-68-01-3852)
(PB-297606/6; EPA-440/4-79-026) Avail: NTIS
HC A05/MF A01 CSCL 13B

The sampling and analysis results of influent, effluent, and sludge in the waters of publicly owned treatment works (POTW) are presented. The water and sediment of the POTWs receiving

waters were tested for 13 heavy metals and 115 synthetic organic compounds. A.W.H.

N80-11964# Environmental Protection Agency, Washington, D.C. Municipal Construction Div.
A HISTORY OF LAND APPLICATION AS A TREATMENT ALTERNATIVE
William J. Jewell and Belford L. Seabrook Apr. 1979 97 p (PB-298227/0; EPA-430/9-79-012; EPA/MCD-40) Avail: NTIS HC A05/MF A01 CSCL 13B

A review was conducted to attempt to determine whether the history of land treatment could assist in explaining the reasons behind the apparent reluctance to use this wastewater treatment option, and to provide a basis of judging its future prospects. The approach to explain the major shifts that have occurred throughout the history of land treatment was to interweave the influences of social-public health concerns, legal issues, and technological developments. Surveys of land treatment system failures showed that most convert from land treatment to discharge technology because of population expansion around the site, and not because of a failure of the renovation capability of the soil. GRA

N80-11965# Georgia Inst. of Tech., Atlanta. Engineering Experiment Station.
SOUTHEASTERN FORUM ON APPROPRIATE TECHNOLOGY Final Report
Jeffrey S. Tiller, David S. Clifton, Jr., and Robert A. Cassanova Apr. 1979 98 p Conf. held at Atlanta, Ga., 17-18 Sep. 1978 (Grant NSF ISP-78-22994)
(PB-298796/4; GIT-B-519-F; NSF/RA-790007) Avail: NTIS HC A05/MF A01 CSCL 05A

The background and purpose of the forum are described as well as its structure and agenda. Results of the forum are presented and a strategy is proposed for NSF to follow in an appropriate technology program. The specific appropriate technologies that participants believed had the greatest potential for widespread implementation were passive solar energy, cooperative community projects, waterless toilets, an AT extension service, active solar equipment, utilization of local material and human resources in energy, resource recovery plants, conversion of biomass to fuel, recycling centers, techniques for passive and active space cooling, photovoltaics and marketing cooperatives for small farms. GRA

88 SPACE SCIENCES (GENERAL)

No abstracts in this category.

89 ASTRONOMY

Includes radio and gamma-ray astronomy; celestial mechanics; and astrometry.

N80-11966* National Aeronautics and Space Administration. Lyndon B. Johnson Space Center, Houston, Tex.
AN EMISSION-LINE SURVEY OF THE MILKY WAY
Robert A. R. Parker, Theodore R. Gull (NASA Goddard Space Flight Center), and Robert P. Kirschner (Mich. Univ.) Washington 1979 224 p
(NASA-SP-434) Avail: SOD HC $15.00 CSCL 03A

The instrumentation used in an examination of the ionization structure of emission nebulae and of the galactic plane in general, is described, as well as the characteristics of the prints obtained. Reasonable exposure times were obtained with the use of an image intensifier and five interference filters isolated the band passes chosen for the survey. A rough map of each field is presented with a print from the Becvar Skalnate Pleso covering the same area. No systematic effort was made to identify and mark each nebulosity. A new supernova remnant was discovered in the field 1 = 65.5 deg, b = + 5 deg using this technique. A.R.H.

N80-11967# Royal Observatory, Edinburgh (Scotland).
SPECTROPHOTOMETRY OF COOL STARS IN THE NEAR INFRARED. RESULTS FOR A REGION IN CASSIOPEIA
K. Nandy, F. Smriglio (Rome Univ.), and R. Buonanno (Rome Astron. Obs.) 1978 19 p refs Reprint from Publ. Roy. Obs. (Edinburg), v. 9, no. 5 1978 p 125-134 Sponsored by Sci. Res. Council
(ISBN-0-9025-5320-8) Avail: NTIS HC A02/MF A01

The space density of M and C stars was investigated for a region of about 15 square degrees in the direction of Cassiopeia. The spectral classification is based on the relative strength of the TiO bands visible in low dispersion objective prism spectra in the photographic infrared. The infrared/magnitudes were derived from direct plates which are calibrated by photoelectric standards obtained with the twin telescope of the Royal Observatory, Edinburgh. It is found that the stars earlier than M4 and carbon stars tend to concentrate in spiral arm regions whereas the late M stars (M7-M10) are evenly distributed in arm and interarm regions. CELESTIAL OBSERVATION AND RELATED WORK Annual Report, 1977-78
1978 38 p refs
Avail: NTIS HC A03/MF A01

Observations centered on quasars and galactic nuclei, galaxies, star clusters, and measurements of stellar radial velocities are reported. Topics covered include clustering and N-body dynamics as well as galactic structure, stellar structure, cosmology, galaxy formation, compact objects, and relativity. As a contribution to astronomical instrumentation, the development of a cooled integrating television system for precision two dimensional photometry continued. The Institute of Astronomy pedagogical activities are also discussed. Author (ESA)

N80-11969# Geneva Observatory (Switzerland).
PHOTOMETRIC PROPERTIES OF G, K AND M STARS IN RELATION TO GALACTIC STRUCTURE AND EVOLUTION
Michel Grenon 1978 33 p refs
(Publ-Ser-B-Fasc-5) Avail: NTIS HC A03/MF A01

During the last ten years, an increasing number of investigations based on photoelectric measurements of G, K and M stars were made in the Geneva photometeic system. The ability of the Geneva system to provide a multi-dimensional classification of the late type stars was tentatively checked on the basis of a small sample of typical objects differing in temperature, luminosity, chemical composition, or showing abundance anomalies. Positive results led to the definition of various programs, tending at first to define precisely the properties of the system, to calibrate it in the various obtainable physical parameters, and to apply these calibrations to investigations mainly in the fields of stellar classification, local galactic structure, and chemical evolution. The main properties of the Geneva system are summarized based on these results and some examples of applications are given. Author (ESA)

N80-11970# Geneva Observatory (Switzerland).
THE MEASUREMENT OF STELLAR RADIAL VELOCITY BY OPTICAL CORRELATION [MESURES DE VITESSE RADIALES STELLAIRES PAR CORRELATION OPTIQUE]
J. L. Poncet 1978 162 p refs In FRENCH; ENGLISH summary
(Publ-Ser-B-Fasc-6) Avail: NTIS HC A08/MF A01

A stellar radial velocity instrument is described. This fully computer controled instrument uses an optical correlation technique, between the stellar spectrum and a spatial filter. An optical method of partitioning the spectrum allows the use of a large spectral range (lambda lambda 360-5200 A) and at the same time takes into account the problem of the variation of the Doppler shift with lambda. The spatial filter is studied and possible sources of systematic and random errors are discussed. Using a one meter Cassegrain telescope, one can determine velocities for stars at least as faint as m sub v = 12 with a precision of about 1 km/sec in less than 10 minutes. Author (ESA)

90 ASTROPHYSICS

Includes cosmology; and interstellar and interplanetary gases and dust.

N80-11971# Academy of Sciences (USSR), Moscow. Inst. of Space Research.
POLARIZATION AND ANISOTROPY OF THE RELICT RADIATION IN AN ANISOTROPIC UNIVERSE
M. M. Basko and A. G. Polnarev. 1979. 20 p. refs.
(PR-486) Avail: NTIS. HC A02/MF A01.

A rigorous solution in the first order with respect to anisotropy is obtained for the equation of polarized radiation transfer in a homogeneous anisotropic universe with a flat co-moving space. The degree of polarization of the background radiation is shown to be very sensitive to the recombination dynamics and to the secondary reheating epoch. Provided that a quadrupole anisotropy of the background radiation is established, the measurements of the degree of its polarization will enable us to set severe limitations on the conditions of secondary ionization. Author (ESA)

91 LUNAR AND PLANETARY EXPLORATION

Includes planetology; and manned and unmanned flights.

For spacecraft design see *18 Spacecraft Design Testing, and Performance*. For space stations see *15 Launch Vehicles and Space Vehicles*.

CONNECTIONS BETWEEN COMETS AND PLASMAS IN SPACE
Frederick L. Scarf. *In* NASA. Goddard Space Flight Center. Space Missions to Comets. 1979. p. 33-58. refs. (For primary document see N80-11972 02-91)
Avail: NTIS. HC A11/MF A01. CSCL 03B.

The dynamical processes in the cometary system represent unusual examples of very important, widespread natural phenomena. Topics covered include: (1) the comet as an obstacle in the solar wind; (2) the nature of the plasma flow; (3) collisionless shocks; and (4) plasma processes in the comet tail. A.R.H.

N80-11975*# National Aeronautics and Space Administration. Ames Research Center, Moffett Field, Calif.
COMETS: COSMIC CONNECTIONS WITH CARBONACEOUS METEORITES, INTERSTELLAR MOLECULES AND THE ORIGIN OF LIFE
Sherwood Chang. *In* NASA. Goddard Space Flight Center. Space Missions to Comets. 1979. p. 59-111. refs. (For primary document see N80-11972 02-91)
Avail: NTIS. HC A11/MF A01. CSCL 03B.

The ions, radicals, and molecules observed in comets may be derived intact or by partial decomposition from parent compounds of the sort found either in the interstellar medium or in carbonaceous meteorites. The early loss of highly reducing primitive atmosphere and its replacement by a secondary atmosphere dominated by H_2O, CO_2, and N_2, as depicted in current models of the earth's evolution, pose a dilemma for the origin of life: the synthesis of organic compounds necessary for life from components of the secondary atmosphere appears to be difficult, and plausible mechanisms have not been evaluated. Both comets and carbonaceous meteorites are implicated as sources for the earth's atmophilic and organogenic elements. A mass balance argument involving the estimated ratios of hydrogen to carbon in carbonaceous meteorites, comets, and the crust and upper mantle suggests that comets supplied the earth with a large fraction of its volatiles. The probability that comets contributed significantly to the earth's volatile inventory suggests a chemical evolutionary link between comets, prebiotic organic synthesis, and the origin of life. A.R.H.

ION PROPULSION AND COMET HALLEY RENDEZVOUS
Kenneth L. Atkins. *In* NASA. Goddard Space Flight Center. Space Missions to Comets. 1979. p. 197-214. (For primary document see N80-11972 02-91)

Avail: NTIS HC A11/MF A01 CSCL 03B

Cometary rendezvous missions using ion propulsion are considered. The characteristics of the ion engine are discussed including the fuel efficiency and acceleration, and the design of the ion engine is described. The operation of the ion drive engine and an overview of its applications are presented. A.W.H.

92 SOLAR PHYSICS

Includes solar activity, solar flares, solar radiation and sunspots.

N80-11980# National Physical Research Lab., Pretoria (South Africa).

COMPARISON OF EXTRATERRESTRIAL AND EARTH-BASED SOLAR SPECTRAL IRRADIANCE RESULTS

C. J. Kok 1979 12 p refs

(CSIR-RR-342; ISBN-0-7988-1447-0) Avail: NTIS HC A02/MF A01

The uncertainties involved in measuring the solar spectral irradiances and the solar constant are discussed. A comparison of extraterrestial and ground based solar spectral energy distributions is presented and evaluated to resolve some of the uncertainties qualitatively. Normalized standard daylight spectral power distribution as related to correlated color temperature is analyzed. A.W.H.

N80-11981# Aerospace Corp., El Segundo, Calif. Space Sciences Lab.

IS THE SUN CONSTANT?

J. B. Blake and D. S. P. Dearborn (Ariz. Univ., Tucson) 30 Oct. 1979 20 p refs

(ATR-79(9552)-4) Avail: NTIS HC A02/MF A01

Models of the solar convection zone were studied. The effect of fluctuations in the mode of energy transport were investigated at different depths in the sun to determine which regions are most effective in causing change. Short term radius fluctuations observed in the model were examined. Possible causes of convective efficiency fluctuations are discussed and the application of this theory to other stars is considered. A.W.H.

DETERMINATION OF THE SOLAR PHOTON FLUX IN THE RANGE OF FROM 160 TO 220 nM USING THE PHOTOLYSIS OF AMMONIA COMBINED WITH NITRIC OXIDE DETECTION Final Report

Christian Hubrich and Friedrich Stuhl Bonn Bundesmin. fuer Forsch. u. Technol. Aug 1978 30 p refs In GERMAN; ENGLISH summary

(Contracts BMFT-WRT-1075; DFVLR-BPT-01-QV-655)

(BMFT-FB-W-78-12) Avail: NTIS HC A03/MF A01; Fachinformationszentrum Energie, Phys., Math., Eggenstein-Leopoldshafen, West Germany DM 6.10

As a possible experimental payload on board SPACELAB, the measurement of the solar photon flux in the wavelength range of from 160 to 220 nm is proposed. Emphasis is placed on the role of this flux rate in the formation of ozone in the stratosphere. It is noted that the concentration of stratospheric ozone is controlled by a complex chemical which can be influenced by human activity. The monitoring of ammonia photolysis combined with nitric oxide detection is suggested as an accurate means of determining photon flux at about 200 nm. It is also pointed out that previous determinations of the photon flux do not agree and hence there is a need to use SPACELAB for this purpose. Author (ESA)

N80-11983# Fraunhofer Institut, Freiburg (West Germany).

PROJECT SPECTROSTRATOSCOPE: BALLOON-BORNE SOLAR RESEARCH Final Report

J. Peter Mehltretter, Wolfgang Mattig, and Alvo vonAlvensleben Bonn Bundesmin. fuer Forsch. u. Technol. Aug 1978 166 p refs In GERMAN; ENGLISH summary

(Contracts BMFT-WRK-0274; DFVLR-BPT-01-DO-184)

(BMFT-FB-W-78-15) Avail: NTIS HC A08/MF A01; Fachinformationszentrum Energie, Phys., Math., Eggenstein-Leopoldshafen, West Germany DM 34.70

A historical review of the project development (1961 to 1975) is followed by an outline description of the instrument. More details on the technical problems related to photometry and the quantitative analysis of the observations are then given. Focusing, instrument profile, instrumental polarization, pointing, and guiding stability are discussed. After a brief description of the balloon flight of 17 May 1975. The functioning of critical components and the thermal behavior of the instrument are analyzed. The scientific program for the investigation of photospheric granulation by means of time series integrated light pictures and spectra with high angular and spectral resolutin is described; first results concerning life times temperature fluctuations, and velocities of granules are reported. SOLAR-GEOPHYSICAL DATA NUMBER 417. PART 2: DATA FOR NOVEMBER 1978 - OCTOBER 1978 AND MISCELLANEA

Helen E. Coffey May 1979 72 p

(PB-297448/3; SGD-417-Pt-2; NOAA-79061403) Avail: NTIS HC A04/MF A01 CSCL 03B

This comprehensive report provides data for November 1978 on: active regions synoptic solar maps, solar flares, solar radio emission, energetic solar particles and plasma, and solar X-ray radiation. It also provides synoptic charts, abbreviated calendar record and regional flare index for October 1978. The miscellaneous data includes solar radio emission for January and February 1979 and cosmic rays for February 1979. GRA

93 SPACE RADIATION

Includes cosmic radiation and inner and outer earth's radiation belts.

For biological effects of radiation see *52 Aerospace Medicine*. For theory see *73 Nuclear and High-Energy Physics*.

A COMBINED TLD/EMULSION METHOD OF SAMPLING DOSIMETRY APPLIED TO APOLLO MISSIONS

Hermann J. Schaefer 1 Sep. 1979 15 p refs

(Contract NAS9-15417)

(NASA-CR-160367) Avail: NTIS HC A02/MF A01 CSCL 03B

A system which simplifies the complex monitoring methods used to measure the astronaut's radiation exposure in space is proposed. The excess dose equivalents of trapped protons and secondary neutrons, protons, and alpha particles from local nuclear interactions are determined and a combined thermoluminescent dosimeter (TLD)/nuclear emulsion method which measures the absorbed dose with thermoluminescent dosimeter chips is presented. A.W.H.

ISOTOPIC COMPOSITION OF PRIMARY COSMIC RAY NITROGEN AND OXYGEN WITH CONSEQUENCES FOR SOURCE MODELS

L. Jacobsson, G. Joensson, and K. Kristiansson 7 Dec. 1978 46 p refs Sponsored by Swed. Nat. Sci. Res. Council

(LUIP-7811) Avail: NTIS HC A03/MF A01

An experimental investigation of the isotopic composition of cosmic ray nitrogen and oxygen is reported. The detector was a stack of nuclear emulsions exposed at about 3 g/sq cm atmospheric depth. The mass determinations were based on photometric track width measurements on stopping nuclei. The energy of the measured nuclei falls in the interval 220 to 450 MeV/nuclean at the top of the atmosphere. The cosmic ray source shows that the nitrogen-oxygen abundances ratio is approximately the same in the source as in the solar system. The results were compared with different hypotheses about the source composition and is found to be in best agreement with

a hypothesis which states that the source matter has approximately the composition of the solar system. Author (ESA)

(Contract F49620-77-C-0101)
(AD-A072436; Rept-26) Avail: NTIS HC A06/MF A01 CSCL 09/5

This report summarizes progress on projects carried out at the Electronics Research Center at The University of Texas at Austin and which were supported by the Joint Services Electronics Program. In the area of Information Electronics progress is reported for projects involving (1) nonlinear filtering and estimation, (2) electronic multi-dimensional signal processing, (3) electronic control systems, (4) electronic computer system design and analysis and (5) electronic computer software systems. In the Solid State Electronics area recent findings in (1) basic solid state materials research and (2) research on instabilities and transport near surfaces and interfaces of solids are described. In the area of Quantum Electronics progress is presented for the following projects: (1) nonlinear wave phenomena, (2) atomic and molecular electronic processes and (3) high power laser systems. GRA

SUPPORT OF SMALL RESEARCH PROJECTS IN MATERIALS SCIENCE AT UNIVERSITIES. Final Report, 1 Aug. 1977 - 20 Jun. 1979
B. N. Gregory 1979 58 p
(Contract F49620-77-C-0135; AF Proj. 2306)
(AD-A071940; AFOSR-79-0838TR) Avail: NTIS HC A04/MF A01 CSCL 20/11

A major question facing the nation's scientific community and makers of science policy, is how to maintain the quality of our scientific programs in the face of shrinking resources, either from budgetary cuts or increasingly sophisticated and costly research needs. To explore this situation the NRC's Solid State Sciences Committee initiated a series of meetings to inquire into the manner in which research is supported in the solid state and materials sciences. The general objectives of the study are to review and enlarge understanding of the role of small research projects in the U.S. solid-state sciences effort, to determine factors that lead to meaningful research projects, and to establish guidelines to aid those who must make decisions concerning the allocation of resources. The intended audience includes both universities and funding agencies. In pursuing this study, the panel was asked to undertake the following general tasks: (1) To assess the role of small research projects in relation to regional and national needs; (2) to determine the factors affecting the production of high-quality research in small projects; and (3) To recommend constructive modes of research organization and required support. SPACE RESEARCH IN THE NETHERLANDS, 1977
1978 34 p refs Presented at COSPAR Meeting, Innsbruck, Switz., Jun. 1978
Avail: NTIS HC A03/MF A01

Solar and stellar space research focused on studying electromagnetic and particle radiation from the sun and stars. Work included cosmic X-ray satellite observations, infrared astronomy, magnetospheric measurements, ultraviolet stellar spectroscopy, and solar X-radiation observation. Research in X-ray astronomy was supported by rocket sounding, satellite experiments, balloon experiments, and the development of a prototype detector with high spatial resolution. Ultraviolet photometry was also undertaken. In the field of satellite geodesy, participation in observation programs and methods of geodetic analysis are reported. Author (ESA)

Results of research and test programs in building, community, materials, processing, energy, and information processing technologies are reported. Specific topics covered include heat economy of buildings, road friction, plastics, lubricants, ceramics, metallic materials and metal production, biotechnology, food science, mineralogy, and measurement of impurities in flue gases. Other areas discussed include graphical processes, mechanical wood handling, ship building, nuclear engineering, measurement of electrical quantities, and data processing and transmission. K.L.

SUBJECT INDEX

Typical Subject Index Listing

The subject heading is the key to the subject content of the document. Titles, report numbers, and accession numbers of pertinent documents are provided under each subject heading. When the title is insufficiently descriptive of the document content, a title extension has been added, separated from the title by three hyphens. The report number helps to indicate the type of document cited (e.g., NASA report, NASA translation, NASA contractor report). The NASA accession number is the number by which the document abstracts are arranged in this journal and by which the document is sold or requested. The titles, with title extensions if present, are arranged under each subject heading in ascending accession number order. The subject headings have been selected from the latest revision of the *NASA Thesaurus* (NASA SP-7050).

AIRCRAFT ANTENNAS
Hemispherical coverage of four-faced aircraft arrays
[AD-A073079] N80-11309

AIRCRAFT COMPARTMENTS
Cabin hazards from a large external fuel fire adjacent to an aircraft fuselage
[AD-A073494] N80-11050

AIRCRAFT CONFIGURATIONS
Multirole cargo aircraft options and configurations — economic analysis
[NASA-TM-80177] N80-11053

AIRCRAFT CONSTRUCTION MATERIALS
Performance of a gel permeation chromatograph and its usefulness in examining mixtures of organic materials — epoxy resin aircraft adhesives
[MRL-R-725] N80-11158

AIRCRAFT CONTROL
Aircraft control by propeller cyclic blades
[NASA-CR-3212] N80-11031
Wind shear hazard definition for a wide body jet — low level wind shear and control simulation
[FAA-RD-79-90] N80-11715

AIRCRAFT DESIGN
Soviet Aeronautics, volume 21, no. 2 — aerodynamics of aircraft structures and engine design
N80-11002
Selecting the passenger airplane fuselage
N80-11024

AIRCRAFT ENGINES
Statistical diagnostics aircraft engines
N80-11006
Opportunistic Maintenance Engine Simulation model: OMENS 2
[AD-A072516] N80-11088
Development of improved abradable compressor gas path seal
[AD-A072171] N80-11474

AIRCRAFT HAZARDS
Wind shear hazard definition for a wide body jet — low level wind shear and control simulation
[FAA-RD-79-90] N80-11715

AIRCRAFT HYDRAULIC SYSTEMS
A hydraulic actuator mechanism to control aircraft spoiler movements through dual input commands
[NASA-CASE-LAR-12412-1] N80-11065

AIRCRAFT MODELS
Fuselage and nozzle pressure distributions on a 1/12-scale F-15 propulsion model at transonic speeds — conducted in langley 16 foot transonic tunnel
[NASA-TP-1521] N80-11036
Wind-tunnel/flight correlation study of aerodynamic characteristics of a large flexible supersonic cruise airplane CXB-70-1]. 1. Wind-tunnel tests of a 0.03-scale model at Mach numbers from 0.6 to 2.53
[NASA-TP-1514] N80-11068

AIRCRAFT NOISE
Noise of a model helicopter rotor due to ingestion of turbulence
[NASA-CR-5215] N80-11067
Airport noise. A bibliography with abstracts
[NTIS/PS-79/0878/3] N80-11674
A closed-form solution for noise contours
[NASA-TP-1432] N80-11869

AIRCRAFT PARTS
A comparison of the pitching and plunging response of an oscillating airfoil
[NASA-CR-3172] N80-11030

AIRCRAFT PERFORMANCE
A method for evaluating aircraft take-off performance
[REPT-1663] N80-11076

AIRCRAFT SAFETY
Cabin hazards from a large external fuel fire adjacent to an aircraft fuselage
[AD-A073494] N80-11050
Clear air turbulence. Citations from the international aerospace abstracts data base — bibliography
[NTIS/PS-79/0858/5] N80-11746

AIRCRAFT STRUCTURES
Improved methods for predicting spectrum loading effects, phase 1 report. Volume 1: Results and discussion
[AD-A072386] N80-11071

AIRCRAFT TIRES
Aircraft rolling resistance in loose, dry snow: A theoretical analysis
[VTI-173-A] N80-11077

AIRFIELD SURFACE MOVEMENTS
Aircraft rolling resistance in loose, dry snow: A theoretical analysis
[VTI-173-A] N80-11077
Surveillance and communication systems using mobile media on the airport surface
[FUB-13-1978] N80-11110

AIRFOIL PROFILES
Mixed inverse problem for profile with given velocity distribution on one side and known thickness law
N80-11026
Design and performance evaluation of supercritical airfoils for axial flow compressors
[AD-A071206] N80-11093

AIRFOILS
A comparison of the pitching and plunging response of an oscillating airfoil
[NASA-CR-3172] N80-11030

AIRGLOW
Studies of atmospheric infrared emissions
[AD-A072831] N80-11689

AIRPORT PLANNING
Airport noise. A bibliography with abstracts
[NTIS/PS-79/0878/3] N80-11674

AIRPORT SURFACE DETECTION EQUIPMENT
Surveillance and communication systems using mobile media on the airport surface
[FUB-13-1978] N80-11110

AIRPORTS
Airport noise. A bibliography with abstracts
[NTIS/PS-79/0878/3] N80-11674

ALGAE
Summer research fellowship program
[NASA-CR-159153] N80-11940
Removal of lagoon effluent suspended solids by a slow-rock filter
[PB-297454/1] N80-11957

ALGORITHMS
FALCONFIX. A multi-modal approach to fix computation — algorithm for determining bearing from radio direction finders
[AD-A072527] N80-11059
An implicit compact fourth-order algorithm for solving the shallow-water equations in conservation-law form
[CSIR-TWISK-57] N80-11531
A FORTRAN algorithm for plotting contours over a triangular mesh
[AD-A072525] N80-11811
Spheroidal functions. Theoretical studies and computational techniques
[CNES-NT-88] N80-11819

The use of complex numbers in a network flow algorithm
[FUB-49-1977] N80-11824
An efficient contention resolution algorithm for multiple access channels
[AD-A072440] N80-11847
On the numerical solution of Cauchy integrals
N80-11853

ALKYL COMPOUNDS
Tertiary oil recovery processes research at the University of Texas
[BETC-0001-1] N80-11544

ALLOCATIONS
World Weather Watch: Consolidated report on the Voluntary Assistance Programme including projects approved for circulation in 1978
[WMO-525] N80-11732

ALLOYS
Investigations of intermetallic alloy hydriding mechanism
[ORO-5246-3] N80-11202

ALTERNATIVES
Fundamental characterization of alternate fuel effects in continuous combustion systems
[SAN-1543-12] N80-11244

ALTITUDE ACCLIMATIZATION
Altitude acclimatization. Citations from the International Aerospace Abstracts data base
[NTIS/PS-79/0857/7] N80-11770

ALUMINUM
Coating laminated substrates
[BDX-613-2062-REV] N80-11153
Cooling aluminum molds using heat pipes
[BDX-613-2039-REV] N80-11384

ALUMINUM ALLOYS
Corrosion fatigue of a marine aluminum alloy [5456-H343] in the presence of shallow cracks
[AD-A072562] N80-11195
Evaluation of yttriated titanium 6 Al-4 V plates and forgings
[AD-A072439] N80-11196
A phenomenological mechanism for the occurrence of the extrusion central burst defect
[AD-A072476] N80-11197
A creep data library for DTD 5070A aluminum alloys
[RAE-TR-76067] N80-11219
The influence on the fatigue properties of aluminum AZ 74 from process variants in sulphuric acid anodizing
[FFA-TN-HU-1943] N80-11220

ALUMINUM COATINGS
The 84-inch propellant grains
[AD-A071961] N80-11240

AMBIENT TEMPERATURE
Exploratory research on novel ambient temperature curing techniques for adhesives, sealants and laminates
[AD-A072591] N80-11227

AMMONIA
Determination of the solar photon flux in the range of from 160 to 220 nm using the photolysis of ammonia combined with nitric oxide detection
[BMFT-FB-W-78-12] N80-11982

AMORPHOUS MATERIALS
Thermal expansion of glasses at low temperatures --- fused silica and polymethyl methacrylate
[IS-T-829] N80-11234
Measurement of diffusion coefficients of short-lived species in solution and in amorphous glasses
[NVO-0535-7] N80-11236

AMPLITUDE DISTRIBUTION ANALYSIS
Program PSD: Digital determination of power spectral densities of random signals
[CSIR-ME-1594] N80-11276

AMPLITUDE MODULATION
Feasibility demonstration of a high power wideband TWT with low AM/PM distortion
[AD-A072932] N80-11342
Analysis and Design of a phase linearization system for traveling wave tube amplifiers
[CNES-NT-86] N80-11362

ANALYSIS OF VARIANCE
Approximations of normal range revisited with new tables for d sub 2 and d sub 3 - factors
[AD-A073004] N80-11851

ANGLE OF ATTACK
The analysis of wing-body combinations at moderate angles of attack --- missile bodies
[AD-A074284] N80-11040
Prediction of lateral aerodynamic loads on fighter aircraft at high angles of attack
[AD-A071893] N80-11073

ANGULAR MOMENTUM
On the balance equation for angular momentum in a plasma
[REPT-1670] N80-11917

ANGULAR VELOCITY
Development of critical fluidic components --- study of fluidic angular velocity sensors
[AD-A071650] N80-11379

ANISOTROPIC MEDIA
Polarization and anisotropy of the relict radiation in an anisotropic universe
[PR-486] N80-11971

ANISOTROPY
Influence of multiaxial stress states, stress gradients and elastic anisotropy on the evaluation of residual stresses by X-rays
[AD-A067909] N80-11190

ANNEALING
Implanted and annealed alloys in physical metallurgy
[SAND-78-1638C] N80-11204
Contour forming of various metals: Deformation and recrystallization characteristics
[LA-UR-78-1412] N80-11205

ANODIC COATINGS
Ellipsometry of anodic film growth
[LBL-8082] N80-11927

ANODIZING
The influence on the fatigue properties of aluminum AZ 74 from process variants in sulphuric acid anodizing
[FFA-TN-HU-1943] N80-11220

ANOMALIES
Aeronomical sounding rocket program. Results of the foil cloud experiment flown on the payload B1 of the National Aeronomy Program Winter Anomaly and Trace Constituents at El Aernosillo, Spain, December 1975 to February 1976
[BMFT-FB-W-78-16] N80-11703
Numerical case studies for oceanic thermal anomalies with a dynamic model
[AD-A072587] N80-11748

ANTENNA ARRAYS
An analysis of the disk microstrip antenna, part 2
[AD-A070794] N80-11294
Hemispherical coverage of four-faced aircraft arrays
[AD-A073079] N80-11309

ANTENNA DESIGN
Antenna of the space radiotelescope KRT-3
[NASA-TM-75714] N80-11280

ANTENNA FEEDS
An improved theory for microstrip antennas and application, part 1
[AD-A070791] N80-11293

ANTENNA RADIATION PATTERNS
Radiation intensity of the PAVE PAWS radar system
[AD-A072333] N80-11303
Hemispherical coverage of four-faced aircraft arrays
[AD-A073079] N80-11309

ANTHROPOMETRY
Height/weight sizing programs for womens protective garments
[AD-A072376] N80-11781

ANTIREFLECTION COATINGS
Spectrally selective surfaces with coatings comprised of ultrafine metal particles --- solar collectors
[AED-CONF-78-212-004] N80-11620

APOLLO FLIGHTS
A combined TLD/emulsion method of sampling dosimetry applied to Apollo missions
[NASA-CR-160367] N80-11985

APPLICATIONS PROGRAMS [COMPUTERS]
Software and procedures for statistical quality control
[ENST-D-79006] N80-11501
The use of computers in solving mathematical problems, volume 2. A bibliography with abstracts
[NTIS/PS-79/0798/3] N80-11799
Spatial population analysis: Methods and computer programs
[IIASA-RR-78-18] N80-11939

APPROACH CONTROL
An assessment of terminal air traffic control system performance with and without basic metering and spacing automation
[AD-A073548] N80-11057
Study for incorporating time-synchronized approach control into the CH-47/VALT digital navigation system
[NASA-CR-159151] N80-11058

APPROPRIATIONS
NASA authorization for fiscal year 1980
[S-REPT-96-207] N80-11951

APPROXIMATION
On a smooth approximation method and its application to mathematical description of wing aerodynamic characteristics
N80-11011
Inequalities and approximation with applications to VSTOL aircraft --- using control theory for optimal control approximations
[AD-A071807] N80-11099
A covariance approximation procedure --- for geodetic data processing
[AD-A072853] N80-11541
The smeared concentration approximation method: A simplified air pollution dispersion methodology for regional analysis
[IIASA-RR-78-9] N80-11635
An approximation technique for small noise open loop control problems
[AD-A072638] N80-11849
Approximations of normal range revisited with new tables for d sub 2 and d sub 3 - factors
[AD-A073004] N80-11851
Unitarity restrictions on semi-classical approximations to certain functional integrals
[COO-313TA-343] N80-11852

AQUEOUS SOLUTIONS
Calculation of chemical equilibrium between aqueous solution and minerals: The EQ3/6 software package
[UCRL-52658] N80-11169

AQUIFERS
Two-dimensional transient dispersion and adsorption in porous media
[UCRL-81970] N80-11386
Determinations of hydrologic parameters for glacial tills in Connecticut
[PB-297578/7] N80-11548
Design optimization of aquifer reservoir-based compressed air storage systems
[CONF-781046-5] N80-11628

ARCHITECTURE
Basic laboratory architecture plan
[AD-A072427] N80-11789

ARCHITECTURE [COMPUTERS]
Integrated Autodin System [IAS]: Generation of viable far-term architectures for IAS
[AD-A072165] N80-11288
An experiment in distributed interpretation
[AD-A072558] N80-11792

ARCTIC REGIONS
Feasibility tests of use of the tri turbo-3 aircraft for arctic AXBT drops
[AD-A073159] N80-11074
Detection of arctic water supplies with geophysical techniques
[AD-A072157] N80-11538

ARGON
Desorption heat capacity of 3He adsorbed on solid argon
[UPTEC-78-16-R] N80-11264
Single-electron capture into Ar + excited states in ar + Na collision below 12 keV. 2: Relative population distributed in Ar + excited states
[IPPJ-411] N80-11876

ARGON PLASMA
Inductively coupled plasma-atomic emission spectroscopy: An evaluation of the use of nitrogen-argon admixtures as plasma discharge atmospheres
N80-11177
Argon/UF6 plasma exhaust gas reconstitution experiments using preheated fluorine and on-line diagnostics --- fissioning uranium plasma core reactor design
[NASA-CR-159158] N80-11906

ARIZONA
The depth of the marine layer at San Diego as related to subsequent cool season precipitation episodes in Arizona
[PB-298817/8] N80-11742

ARMATURES
Digital calculation of the commutation characteristics of armature windings
[DRIC-TRANS-5359] N80-11361

ARMED FORCES [UNITED STATES]
Height/weight sizing programs for womens protective garments
[AD-A072376] N80-11781

ARMOR
Development of laser welding techniques for joining armor
[AD-A072536] N80-11473

ARPA COMPUTER NETWORK
Message services in computer networks
[AD-A071730] N80-11282

ARRAYS
Interaction in limited arrays of windmills: Review of earlier results from a simple model and a presentation of the capabilities of a dynamic PBL model
[DM-26] N80-11631

ARTIFICIAL INTELLIGENCE
Heuristics for knowledge acquisition from maps
[AD-A073126] N80-11540

ARTIFICIAL SATELLITES
Optical artificial satellite searches --- summary of using celestial mechanics in astronomy for observations
[AD-A071248] N80-11124
Processing and display techniques for multispectral satellite imagery
[AD-A072509] N80-11534

ASBESTOS
USPHS/NIOSH membrane filter method for evaluating airborne asbestos fibers
[PB-297731/2] N80-11663

ASIA
Propagation of Lg waves across eastern Europe and Asia
[UCRL-52494] N80-11312

ASPECT RATIO
Ballooning beta limit of a non-circular small-aspect-ratio Tokamak
[IPPJ-413] N80-11902

ASTROLOY [TRADEMARK]
Effect of thermally induced porosity on an as-HIP powder metallurgy superalloy
[NASA-TM-79263] N80-11189

ASTRONOMICAL MODELS
Informal conference on Status and Future of Solar Neutrino Research; proceedings
[BNL-50879-VOL-2] N80-11890
Polarization and anisotropy of the relict radiation in an anisotropic universe
[PR-486] N80-11971

ASTRONOMICAL NETHERLANDS SATELLITE
Space Research in the Netherlands, 1977
N80-11990

ASTRONOMICAL PHOTOGRAPHY
An emission-line survey of the Milky Way
[NASA-SP-434] N80-11966

Scientific need for a cometary mission
N80-11973

ASTRONOMICAL PHOTOMETRY
Celestial observation and related work --- theory, observations, and instrumentation
N80-11968

ASTRONOMICAL TELESCOPES
Celestial observation and related work --- theory, observations, and instrumentation
N80-11968

ASTRONOMY
Optical artificial satellite searches --- summary of using celestial mechanics in astronomy for observations
[AD-A071248] N80-11124
Celestial observation and related work --- theory, observations, and instrumentation
N80-11968
Space research in Switzerland, 1978
N80-11995

ASYMMETRY
An investigation into the effects of asymmetry on robust estimates of regression
[AD-A072597] N80-11848

ASYMPTOTES
Testing transformations to achieve approximate normality
[AD-A072596] N80-11846

ASYMPTOTIC SERIES
On Berry-Essen rates for statistical functions, with application to L-estimates
[AD-A072131] N80-11854

ATLANTIC OCEAN
A climatological study on the occurrence of easterly gales on the North Atlantic Ocean
[KNMI-WR-79-5] N80-11737
Long wave coupling of the mid and south Atlantic bights forced by the atmosphere
[AD-A072282] N80-11749

ATMOSPHERIC ATTENUATION
Concepts for 18/30 GHz satellite communication system, volume 1
[NASA-CR-159625-VOL-1] N80-11277
An investigation of a mathematical model for atmospheric absorption spectra
[NASA-CR-162430] N80-11677
Space research in Switzerland, 1978
N80-11995

ATMOSPHERIC BOUNDARY LAYER
On surface-based advective radar ducts
[AD-A071454] N80-11289
Parameterization of vertical diffusion in a diurnally varying boundary layer
[DM-27] N80-11706
The atmosphere boundary layer
[WMO-523] N80-11707

ATMOSPHERIC CHEMISTRY
Shuttle atmospheric lidar research program
[NASA-SP-433] N80-11414
Scientific objective 2: Stratospheric and mesospheric chemistry and transport
N80-11417
Scientific objective 6: Thermospheric chemistry and transport
N80-11421
Scientific objective 7: Magnetospheric sun and weather relationships
N80-11422
Candidate shuttle lidar experiments
N80-11423
Shuttle atmospheric lidar program evolution
N80-11424
Appendix A: Descriptions of shuttle borne lidar experiments
N80-11425

ATMOSPHERIC CIRCULATION
On surface-based advective radar ducts
[AD-A071454] N80-11289
Shuttle atmospheric lidar research program
[NASA-SP-433] N80-11414
Scientific objective 1: Global flow of water vapor and pollutants
N80-11416
Scientific objective 2: Stratospheric and mesospheric chemistry and transport
N80-11417
Scientific objective 6: Thermospheric chemistry and transport
N80-11421
Convection induced temperature change in GATE
[PB-298130/6] N80-11712
The dynamics of equatorial mass-flow adjustment
[PB-297992/0] N80-11740

ATMOSPHERIC COMPOSITION
Shuttle atmospheric lidar research program
[NASA-SP-433] N80-11414
Scientific objective 3: Radiative models
N80-11418
Environmental control technology for carbon dioxide
[BNL-24999] N80-11639
Carbon dioxide and the greenhouse effect: An unresolved problem
[ICTIS/ER-01] N80-11708
Airborne measurements of cloud forming nuclei and aerosol particles at Kennedy Space Center, Florida
[NASA-CR-160359] N80-11716

ATMOSPHERIC DIFFUSION
The smeared concentration approximation method: A simplified air pollution dispersion methodology for regional analysis
[IIASA-RR-78-9] N80-11635
Smog chamber validation using Lagrangian atmospheric data
[PB-297480/6] N80-11662

ATMOSPHERIC EFFECTS
Interannual variability of the ocean atmosphere system
[NASA-CR-162456] N80-11730

ATMOSPHERIC ENERGY SOURCES
Spectral radiometric measurement and analysis program. Volume 1: Description of mobile radiometric laboratory system
[AD-A072078] N80-11722

ATMOSPHERIC HEATING
Effects of precursor heating on radiative and chemically reacting viscous flow around a Jovian entry body
[NASA-CR-3186] N80-11375

ATMOSPHERIC MODELS
Scientific objective 3: Radiative models
N80-11418
The use of a trajectory model for studying interregional transport of air pollution
[KNMI-WR-79-6] N80-11645
Parameterization of vertical diffusion in a diurnally varying boundary layer
[DM-27] N80-11706
The atmosphere boundary layer
[WMO-523] N80-11707
The application of measures of synoptic similarity to the evaluation and development of atmospheric prediction models: Task 1
[AD-A073098] N80-11725
The dynamics of equatorial mass-flow adjustment
[PB-297992/0] N80-11740
The role of the asymmetric terms of the divergence and vorticity equations in the zero Laplacian vortex
[AD-A072452] N80-11850
Space research in Belgium, 1978
N80-11997

ATMOSPHERIC MOISTURE
Scientific objective 1: Global flow of water vapor and pollutants
N80-11416
Study of temperature/moisture retrieval capabilities of DMSP/SSH sensor channels
[AD-A073144] N80-11542
Comparison of spectroscopic and radiometric measurements of upper atmosphere water vapor
[PB-299072/9] N80-11713
Infrared absorption by water clusters
[AD-A071455] N80-11895

ATMOSPHERIC OPTICS
Scientific objectives
N80-11415
Scientific objective 1: Global flow of water vapor and pollutants
N80-11416

ATMOSPHERIC PHYSICS
Low latitude atmospheric X-rays observed by HEAO-1
[AD-A072722] N80-11684
Studies of atmospheric infrared emissions
[AD-A072831] N80-11689

ATMOSPHERIC RADIATION
Scientific objective 3: Radiative models
N80-11418

ATMOSPHERIC REFRACTION
Test plan for intermediate range airblast propagation measurements
[SAND-78-1703] N80-11389
Analysis of tropospheric effects at low elevation angles
[AD-A073089] N80-11691

ATMOSPHERIC SCATTERING
Spectral radiometric measurement and analysis program. Volume 4: SCAT3 operator's manual
[AD-A072081] N80-11720

ATMOSPHERIC TEMPERATURE
Study of temperature/moisture retrieval capabilities of DMSP/SSH sensor channels
[AD-A073144] N80-11542
Convection induced temperature change in GATE
[PB-298130/6] N80-11712

ATMOSPHERIC TIDES
Scientific objective 5: Upper atmospheric waves
N80-11420

ATMOSPHERIC TURBULENCE
Evaluation of a wind-tunnel gust response technique including correlations with analytical and flight test results
[NASA-TP-1501] N80-11028
Noise of a model helicopter rotor due to ingestion of turbulence
[NASA-CR-3213] N80-11067
The usefulness of data from mountaintop fire lookout stations in determining atmospheric stability --- determining atmospheric turbulence indexes to forecast thunderstorms
[PB-298899/6] N80-11743

ATOMIC COLLISIONS
Atomic and molecular interaction theory
[AD-A072124] N80-11878

ATOMIC EXCITATIONS
Collective states and crossing symmetry
[CSIR-TWISK-58] N80-11840
Single-electron capture into Ar + excited states in ar + Na collision below 12 keV. 2: Relative population distributed in Ar + excited states
[IPPJ-411] N80-11876

ATOMS
Study by elastic theory of the clustering of solute atoms during the early stage of solid solution decomposition --- using strain energy method martensite
[LBL-7680] N80-11880

ATS 6
Correlation studies of protonospheric electron content over the US continent --- using ATS 6 transmissions
[AD-A073080] N80-11686

ATTITUDE [INCLINATION]
Lateral and tilt whirl modes of flexibly mounted flywheel systems --- for energy storage
[SAND-78-7070] N80-11622

AUDIO FREQUENCIES
Digital sound: Sampling-rate synchronisation by variable delay
[BBC-RD-1979/17] N80-11271

AUDITORY PERCEPTION
Perception and performance in flight simulators: The contribution of vestibular, visual, and auditory information
[NASA-CR-162129] N80-11103

AUDITORY SIGNALS
F-4 radar altimeter aural warning
[AD-A072870] N80-11085

AUDITORY STIMULI
Interstimulus interval as it affects temporary threshold shift in serial presentations of loud tones
[AD-A072006] N80-11762

AUGER SPECTROSCOPY
The influence of contact and interface effects of the electronic properties and stability of chemically unstable materials
[AD-A073073] N80-11243

AURORAL ARCS
A case study of S3-2 observations in the late evening auroral oval
[AD-A072996] N80-11692
Study of the equatorward edge of the auroral oval from satellite observations
[AD-A072997] N80-11693

AURORAS
Non-neutral field-aligned current sheet and auroral electric field
[AD-A072852] N80-11687
Coordinated data analysis of ONR-118 data --- ionospheric scintillation and disturbance phenomena
[AD-A073113] N80-11690
A case study of S3-2 observations in the late evening auroral oval
[AD-A072996] N80-11692
Study of the equatorward edge of the auroral oval from satellite observations
[AD-A072997] N80-11693

AUSTENITIC STAINLESS STEELS
Experimental electro-thermal method for nondestructively testing welds in stainless steel pipes
[HEDL-SA-1705] N80-11497

AUTOMATA THEORY
Inference under order and smoothness restrictions with applications in time series analysis
[AD-A072594] N80-11858

AUTOMATIC CONTROL
A hydraulic actuator mechanism to control aircraft spoiler movements through dual input commands
[NASA-CASE-LAR-12412-1] N80-11065
Automated monitoring of thin film capacitors for electrical breakdown
[BDX-613-2076-REV] N80-11359
The automated array assembly task of the low-cost silicon solar array project, phase 2
[NASA-CR-162429] N80-11562

AUTOMATIC FLIGHT CONTROL
An assessment of terminal air traffic control system performance with and without basic metering and spacing automation
[AD-A073548] N80-11057

AUTOMATION
Space Construction Automated Fabrication Experiment Definition Study. [SCAFEDS], part 3. Volume 1: Executive summary
[NASA-CR-160345] N80-11111

AUTOMOBILES
Ranking tires using a transient speed-time cycle
[PB-297756/9] N80-11487
Summary report on motor vehicle emissions inspection and maintenance programs for non-attainment areas in Louisiana
[PB-294979/0] N80-11648

AUTORADIOGRAPHY
Data analysis software for the autoradiographic enhancement process. Volumes 1, 2, and 3, and appendix
[NASA-CR-161327] N80-11804

AVALANCHE DIODES
A method for temperature stabilization of current generators and zenerdiodes
[UPTEC-78-76-R] N80-11366

AVIONICS
Aircrew displays and avionics for application in a future national airspace system
[NASA-TM-80095] N80-11052
Evaluation of dais technology applied to the integrated navigation system of a tactical transport
[AD-A073068] N80-11061
Inertial navigation and guidance. Citations from the international aerospace abstracts data base
[NTIS/PS-79/0825/4] N80-11064
AVIONICS: Projections for civil aviation, 1995-2000
[NASA-CR-159035] N80-11079
Avionics master plan data base mechanization architecture
[AD-A071545] N80-11083
AXIAL FLOW
The response of a turbulent boundary layer to lateral divergence
[IC-AERO-78-03] N80-11394
AXIAL LOADS
Effect of multiaxial loading on crack growth. Volume 3: Compilation of interferometry photographs
[AD-A072074] N80-11512
AXIAL STRAIN
On the limit state of a toroidal shell of revolution under axisymmetric deformation
N80-11015
Explosive technique for asisymmetric expansion of cylinders at high strain rates
[SAND-78-2393] N80-11261
AXIAL STRESS
Effect of multiaxial loading on crack growth. Volume 3: Compilation of interferometry photographs
[AD-A072074] N80-11512
AXISYMMETRIC FLOW
Separated flow problems within the transonic and supersonic flow regimes
[AD-A071899] N80-11042
A study of coherent structures in axisymmetric jets using an optical technique
[AASU-341] N80-11399
AZINES
Chromatography of metal ions with a triazine chelating resin
[IS-T-855] N80-11167

B

B-70 AIRCRAFT
Wind-tunnel/flight correlation study of aerodynamic characteristics of a large flexible supersonic cruise airplane CXB-70-1]. 1: Wind-tunnel tests of a 0.03-scale model at Mach numbers from 0.6 to 2.53
[NASA-TP-1514] N80-11068
BACKGROUND RADIATION
Polarization and anisotropy of the relict radiation in an anisotropic universe
[PR-486] N80-11971
BALANCE
Preliminary investigations of design philosophies and features applicable to large magnetic suspension and balance systems
[NASA-CR-162433] N80-11104
BALLISTIC MISSILES
The 19305A GSRS missile number 1025, round number V-33
[AD-A071894] N80-11718
The 19305A GSRS missile number 1055 round number V-31
[AD-A071880] N80-11719
BALLISTICS
Impact induced tensile failures in steel
[AD-A072477] N80-11191
BALLOON SOUNDING
Space research in the Federal Republic of Germany, 1978
N80-11992
BALLOON-BORNE INSTRUMENTS
Project Spectrostratoscope: Balloon-borne solar research
[BMFT-FB-W-78-15] N80-11983
BAND STRUCTURE OF SOLIDS
Catalysis by transition metal compounds --- cobalt oxide
[COO-1198-1234] N80-11217
BANDWIDTH
Spectral estimates of band-limited signals
[AD-A072776] N80-11306
BARIUM ION CLOUDS
Radio communication utilizing the base of a striated barium plasma
[AD-A072167] N80-11299
BAROTROPIC FLOW
The dynamics of equatorial mass-flow adjustment
[PB-297992/0] N80-11740
BARRIER LAYERS
Gas flow through porous barriers
[LBL-8283] N80-11388
BAYES THEOREM
A Bayesian nonparametric approach to reliability
[AD-A072431] N80-11491
Accelerated life testing: A pragmatic Bayesian approach
[AD-A072622] N80-11494
BAYS [TOPOGRAPHIC FEATURES]
Reconnaissance survey of the distribution and abundance of benthic organisms in the New York Bight Apex 5-14 June 1973
[PB-297333/7] N80-11552
BEAM WAVEGUIDES
Waveguide studies for fiber optic sources
[AD-A071446] N80-11897
BEAMS [SUPPORTS]
Numerical integration of equations of theory of thin-wall beams with deformable contour
N80-11018
Space Construction Automated Fabrication Experiment Definition Study. [SCAFEDS], part 3. Volume 1: Executive summary
[NASA-CR-160345] N80-11111
BEARING [DIRECTION]
FALCONFIX: A multi-modal approach to fix computation --- algorithm for determining bearing from radio direction finders
[AD-A072527] N80-11059
BEARINGS
Determination of physical and chemical states of lubricants in concentrated contacts, part 1
[NASA-CR-3204] N80-11225
BENDING FATIGUE
Stress concentration factors for fillet welded joints during bending
N80-11523
BENDING MOMENTS
Influence of contour deformation in prebuckling state on bending stability of open cylindrical shells
N80-11025
BERYLLIUM
Analysis of beryllium parts for cosmos 954
[UCRL-52597] N80-11127
Electron-beam braze welding of beryllium
[Y-2138] N80-11477
BIAS
An investigation into the effects of asymmetry on robust estimates of regression
[AD-A072597] N80-11848
BIBLIOGRAPHIES
Supersonic Cruise Research [SCR] program publications for fiscal year 1977 through fiscal year 1979: Preliminary bibliography --- bibliographies
[NASA-TM-80184] N80-11029
Air traffic control simulation models volume 2. A bibliography with abstracts
[NTIS/PS-79/0799/1] N80-11062
Inertial navigation and guidance. Citations from the international aerospace abstracts data base
[NTIS/PS-79/0825/4] N80-11064
Ablation and ablative materials. Citations from the international aerospace abstracts data base --- bibliographies
[NTIS/PS-79/0833/8] N80-11157
Gallium arsenide lasers. Citations from the international aerospace abstracts data base
[NTIS/PS-79/0821/3] N80-11458
Dye lasers. Citations from the international aerospace abstracts data base
[NTIS/PS-79/0823/9] N80-11460
Neodymium YAG lasers. Citations from the international aerospace abstracts data base
[NTIS/PS-79/0862/7] N80-11461
Ultraviolet lasers. Citations from the international aerospace abstracts data base
[NTIS/PS-79/0861/9] N80-11462
Hydrogen flouride and deuterium fluoride lasers. Citations from the international aerospace abstracts data base
[NTIS/PS-79/0860/1] N80-11463
Laser cutting and machining: Nonmetals. Citations from the Engineering Index data base --- bibliography with abstracts
[NTIS/PS-79/0891/6] N80-11464
Dye lasers, volume 2. A bibliography with abstracts
[NTIS/PS-79/0894/0] N80-11465
Neodymium YAG lasers. A bibliography with abstracts
[NTIS/PS-79/0883/3] N80-11466
Gas dynamic lasers. A bibliograpy with abstracts
[NTIS/PS-79/0839/5] N80-11467
Remote sensing applied to hydrology. A bibliography with abstracts
[NTIS/PS-79/0845/2] N80-11553
National environmental/energy workforce assessment, phase 3. Air programs --- bibliography
[PB-298580/2] N80-11670
Airport noise. A bibliography with abstracts
[NTIS/PS-79/0878/3] N80-11674
Chemical analysis of aerosols and airborne particulates, volume 2. A bibliography with abstracts
[NTIS/PS-79/0791/8] N80-11675
Fog prediction. A bibliography with abstracts
[NTIS/PS-79/0820/5] N80-11739
Clear air turbulence. Citations from the international aerospace abstracts data base --- bibliography
[NTIS/PS-79/0858/5] N80-11746
Telecommunications in medicine. A bibliography with abstracts
[NTIS/PS-79/0786/8] N80-11769
Altitude acclimatization. Citations from the International Aerospace Abstracts data base
[NTIS/PS-79/0857/7] N80-11770
The use of computers in solving mathematical problems, volume 2. A bibliography with abstracts
[NTIS/PS-79/0798/3] N80-11799
Computer storage management. A bibliography with abstracts
[NTIS/PS-79/0884/1] N80-11800
BIG BANG COSMOLOGY
Polarization and anisotropy of the relict radiation in an anisotropic universe
[PR-486] N80-11971
BIOCHEMISTRY
Biochemical studies of the Potomac estuary, summer 1978
[PB-297394/9] N80-11752
BIOCONTROL SYSTEMS
Identification of controls in neuro-musculoskeletal control system models
[CSIR-TWISK-52] N80-11761
BIODYNAMICS
Identification of controls in neuro-musculoskeletal control system models
[CSIR-TWISK-52] N80-11761
BIOLOGICAL EFFECTS
Interaction of low levels of ozone and relative humidity on leafy vegetables
[PB-297062/2] N80-11658
Calculated linear energy transfer spectra of HZE particles for the free flyer Biostack experiment on the LDEF-mission
N80-11767
Summary of radiobiological findings: From spaceflight to ground-based studies
N80-11768
BIOMASS ENERGY PRODUCTION
Biofuels: A survey
[EPRI-ER-746-SR] N80-11250
Increased energy from biomass: 1985 possibilities and problem. Working papers for planners
[RLO-788-5] N80-11589
Research overview of biological and chemical conversion methods and identification of key research areas for SERI
[SERI/TR-33-067] N80-11617
BIOMEDICAL DATA
STARPAHC space-oriented medical evaluation --- telemedicine system
[NASA-CR-160360] N80-11763
Cold air inhalation, esophageal temperature lung function in exercising humans
[AD-A069510] N80-11765
BIONICS
Identification of controls in neuro-musculoskeletal control system models
[CSIR-TWISK-52] N80-11761
BIOTELEMETRY
STARPAHC space-oriented medical evaluation --- telemedicine system
[NASA-CR-160360] N80-11763
BIPOLAR TRANSISTORS
Nanosecond pulsers for MM wave tubes
[AD-A071414] N80-11333
BITERNARY CODE
The application of measures of synoptic similarity to the evaluation and development of atmospheric prediction models: Task 1
[AD-A073098] N80-11725
BIVARIATE ANALYSIS
Computer generation of bivariate gamma random vectors
[AD-A072407] N80-11844
BLOCKS
Trend-free block designs: Existence and construction results
[AD-A072138] N80-11863
BLOWDOWN WIND TUNNELS
Data acquisition systems for the hypersonic gun and nitrogen wind tunnels
[IC-AERO-79-03] N80-11109
BLUNT BODIES
Aerodynamic heating of blunt wedges
N80-11008
Flow behind curved shock waves
[UTIAS-217] N80-11374
BO-105 HELICOPTER
A compilation and analysis of helicopter handling qualities data. Volume 1: Data compilation
[NASA-CR-3144] N80-11097
BODY TEMPERATURE
The 5-thio-d-glucose thermoregulatory effects in mice at various temperatures
[AD-A069511] N80-11757
BODY-WING CONFIGURATIONS
The analysis of wing-body combinations at moderate angles of attack --- missile bodies
[AD-A074284] N80-11040
BOILERS
Comparisons of RETRAN and two-velocity two-phase flow models with experimental data
[EPRI-NP-928] N80-11392
Technical assessment of thermal DeNOx process --- for coal fired boilers
[PB-297947/4] N80-11656
BORIDES
Magnetic anomaly in superconducting TmRa4B4
[LA-UR-78-2701] N80-11347
BORON CHLORIDES
Isotope separation by laser-induced photomigration --- boron chlorides
[LA-TR-78-36] N80-11882

BOUNDARY LAYER COMBUSTION
Nonisenthalpic interaction of a planar premixed laminar flame with a parallel end wall
[AD-A071858] N80-11160
BOUNDARY LAYER FLOW
Measurements on a three-dimensional swept wing at low speeds. Part 1: The flow around the leading edge
[FFA-130-PT-1] N80-11044
Measurements on a three-dimensional swept wing at low speeds. Part 2: The flow in the boundary layer on the main wing
[FFA-131-PT-2] N80-11045
Wind loads on flat plate photovoltaic array fields
[NASA-CR-162424] N80-11563
BOUNDARY LAYER SEPARATION
One dimensional design of centrifugal compressors taking into account flow separation in the impeller
[VKI-TN-129] N80-11486
BOUNDARY LAYER TRANSITION
Further observations on transition in a pipe
[AD-A071909] N80-11378
BOUNDARY LAYERS
Separated flow problems within the transonic and supersonic flow regimes
[AD-A071899] N80-11042
Study of boundary structures
[AD-A071710] N80-11843
On the boundary layer between a flowing plasma and a magnetic field. Part 1. The conditions for equilibrium
[CRPE-NT-63-PT-1] N80-11921
BOUNDARY VALUE PROBLEMS
A computational model for three-dimensional incompressible wall jets with large cross flow
[AD-A071689] N80-11495
Study of boundary structures
[AD-A071710] N80-11843
Electromagnetic boundary-valve problems based upon a modification of residue calculus and function theoretic techniques
[PB-297305/5] N80-11867
BRAIN
Spatio-temporal intergration in the visual system
[AD-A069558] N80-11780
BRAZING
Electron-beam braze welding of beryllium
[Y-2138] N80-11477
BREMSSTRAHLUNG
Low latitude atmospheric X-rays observed by HEAO-1
[AD-A072722] N80-11684
BRINES
On-line tests of organic additives for the inhibition of the precipitation of silica from hypersaline geothermal brine. 2: Tests of nitrogen-containing compounds, silanes, and additional ethoxylated compounds
[UCID-18195] N80-11567
Thermodynamics of high temperature brines
[LBL-8973] N80-11936
BRITTLENESS
Brittle materials design, high temperature gas turbine
[AD-A071750] N80-11090
BROADCASTING
Satellite broadcasting: Results of a preliminary coverage survey in the UK
[BBC-RD-1979/18] N80-11270
BUBBLE TECHNIQUE
The 10 to the 8th power bit solid state spacecraft data recorder --- utilizing bubble domain memory technology
[NASA-CR-3182] N80-11136
BUDGETING
Zero base budget software
[PB-298732/9] N80-11942
Support of small research projects in materials science at universities
[AD-A071940] N80-11989
BUFFER STORAGE
Digital sound: Sampling-rate synchronisation by variable delay
[BBC-RD-1979/17] N80-11271
BUILDINGS
An evaluation of the NASA Tech House, including live-in test results, volume 1
[NASA-TP-1564] N80-11559
Heat pump centered integrated community energy system; system development
[ANL/ICES-TM-31] N80-11575
Case study of the Brownell low energy requirement house, thermal storage analysis
[BNL-25832] N80-11584
BUNCHING
Space charge limited transport and bunching of non K-V beams
[AD-A072417] N80-11877
BURNS [INJURIES]
A porcine bioassay method for analysis of thermally protective fabrics: A clinical grading system
[AD-A069202] N80-11766
BURSTS
A phenomenological mechanism for the occurrence of the extrusion central burst defect
[AD-A072476] N80-11197
BUTANES
Experimental enthalpies for a mixture of 80 mole percent isobutane in isopentane
[EPRI-ER-1034] N80-11935
BUTT JOINTS
Explosive forming of butt welded pipe reducers
[AD-A072430] N80-11475

C

CADMIUM
A field study of the relationship between heavy metal concentrations in stream water and selected benthic macroinvertebrate species
[PB-297284/2] N80-11651
CADMIUM ALLOYS
The deposition of gold - copper - cadmium alloys
[DRIC-TRANS-5465] N80-11218
CALCULATORS
Radar detection calculations with the HP-65 and HP-67
[AD-A071609] N80-11281
CALCULUS OF VARIATIONS
Analytic design of regulators for variable-parameter systems
N80-11020
CALIBRATING
Use of indexed sensitivity factors in the analysis of nickel and iron based alloys: Study of the decalibration of sheathed Chromel/Alumel thermocouples
[CONF-781076-1] N80-11406
Space dosimetry. Volume 2: Technical appendices
[FRI-R646/3-VOL-2] N80-11413
CALIFORNIA
The depth of the marine layer at San Diego as related to subsequent cool season precipitation episodes in Arizona
[PB-298817/8] N80-11742
CALORIMETERS
Solution microcalorimeter for measuring heats of solution of radioactive elements and compounds
[ORO-4447-081] N80-11405
CAMERAS
Laser scanning camera
[TDB-324] N80-11457
CANADA
United States/Canada electricity exchanges
[DOE/ERA-0053] N80-11583
CANTILEVER BEAMS
Higher order tapered beam finite elements for vibration analysis
[ISVR-TR-99] N80-11525
CAPACITORS
Automated monitoring of thin film capacitors for electrical breakdown
[BDX-613-2076-REV] N80-11359
CARBON
Effect of periodic chemical variation on the mechanical properties of Ta foils
[LA-UR-78-3065] N80-11206
Simulation of land-use patterns affecting the global carbon cycle
[ORNL/TM-6651] N80-11701
Comets, carbonaceous chondrites, and interstellar clouds: Condensation of carbon
N80-11976
CARBON DIOXIDE
Gas flow through porous barriers
[LBL-8283] N80-11388
Oil recovery by carbon dioxide injection --- West Virginia
[ORO-5301-34] N80-11545
Environmental control technology for carbon dioxide
[BNL-24999] N80-11639
Carbon dioxide contributions in respiratory control
N80-11760
CARBON DIOXIDE CONCENTRATION
Carbon dioxide and the greenhouse effect: An unresolved problem
[ICTIS/ER-01] N80-11708
CARBON DIOXIDE LASERS
Characteristics of laser cutting Kevlar laminates
[BDX-613-2075-REV] N80-11456
Isotope separation by laser-induced photomigration --- boron chlorides
[LA-TR-78-36] N80-11882
CARBON FIBER REINFORCED PLASTICS
Influence of environmental cycling on the mechanical properties of composite materials, part 2
[FFA-TN-HU-1853:1-PT-2] N80-11155
CARBON FIBERS
Development and fabrication of bismaleimide-graphite composites
[NASA-CR-152324] N80-11141
CARBON STEELS
Loss of fracture resistance in high carbon steel due to non-martensitic phases
[AD-A072051] N80-11193
Studies of abrasive wear in a modified impact testing machine --- on low carbon steels
[UPTEC-78-79-R] N80-11481
CARBON-CARBON COMPOSITES
An experimental apparatus for investigating the kinetic reactions in solid rocket nozzles --- reaction kinetics of carbon-carbon composite prototype rocket nozzles
[AD-A071318] N80-11138
CARBONACEOUS CHONDRITES
Comets, carbonaceous chondrites, and interstellar clouds: Condensation of carbon
N80-11976
CARBONACEOUS METEORITES
Comets: Cosmic connections with carbonaceous meteorites, interstellar molecules and the origin of life
N80-11975
CARBONATES
Influence of electrolyte composition on electrode kinetics in the molten carbonate fuel cell
[CONF-781063-2] N80-11615
CARCINOGENS
Ambient air carcinogenic vapors, improved sampling and analytical techniques and field studies
[PB-297932/6] N80-11185
CARET WINGS
Overall aerodynamic characteristics of caret and delta wings at supersonic speeds
N80-11022
CARGO AIRCRAFT
Multirole cargo aircraft options and configurations --- economic analysis
[NASA-TM-80177] N80-11053
CARIBBEAN SEA
OTEC thermal resource report for Caribbean Sea Plant Ship 13-15 degrees N 75-80 degrees N
[HCP/T2898] N80-11599
CASCADE FLOW
Streakline flow visualization study of a horseshoe vortex in a large-scale, two-dimensional turbine stator cascade
[NASA-TM-79274] N80-11376
CASE HISTORIES
Comet Halley and history
N80-11978
CATALOGS [PUBLICATIONS]
Lack of accountability in Government public information and publishing programs
[GPO-45-775] N80-11943
A manual for cataloging and indexing documents --- geothermal energy data base
[LBL-4432-REV-1] N80-11946
CATALYSIS
Catalysis by transition metal compounds --- cobalt oxide
[COO-1198-1234] N80-11217
CATALYSTS
Non-noble colloidal catalysts
[AD-A072757] N80-11338
CATHODES
Analysis of the influence of space conditions upon reactions between liquid as well as gaseous corrosive agents and metals
[BMFT-FB-W-77-10] N80-11222
CAUCHY INTEGRAL FORMULA
On the numerical solution of Cauchy integrals
N80-11853
CAVITATION CORROSION
The response of coated steels to cavitation in corrosive environments
[AD-A072841] N80-11200
CAVITY RESONATORS
An improved theory for microstrip antennas and application, part 1
[AD-A070791] N80-11293
An analysis of the disk microstrip antenna, part 2
[AD-A070794] N80-11294
CELESTIAL MECHANICS
Optical artificial satellite searches --- summary of using celestial mechanics in astronomy for observations
[AD-A071248] N80-11124
CENTRIFUGAL COMPRESSORS
One dimensional design of centrifugal compressors taking into account flow separation in the impeller
[VKI-TN-129] N80-11486
CERAMIC NUCLEAR FUELS
General-purpose heat source development. Phase 1: Design requirements
[LA-7385-SR] N80-11608
CERAMICS
Assessment of the state of knowledge pertaining to solid particle erosion
[AD-A073034] N80-11199
Effect of chemical environments on the fracture of ceramic surfaces
[SAND-78-1664C] N80-11229
Etching study for the MC2980 glass ceramic preform
[SAND-78-1295] N80-11235
Ceramic piezoelectric transducers
[AD-A071652] N80-11334
Production Engineering Measure [PEM] manufacturing methods and technology for piezoelectric transformers
[AD-A072674] N80-11343
Extended tests of Saffil aluminum filter media --- for hot gas cleanup
[PB-297567/0] N80-11652
CH-47 HELICOPTER
Study for incorporating time-synchronized approach control into the CH-47/VALT digital navigation system
[NASA-CR-159151] N80-11058
CHANNELS [DATA TRANSMISSION]
Avionic system architecture investigation [AVSAR II]
[AD-A071743] N80-11080
Precipitation and multipath effects on propagation phenomena. System characteristics and transmission

quality of numerical radio links with and without frequency reuse
[FUB-29-1978] N80-11321
An efficient contention resolution algorithm for multiple access channels
[AD-A072440] N80-11847
CHARGE COUPLED DEVICES
Low-loss charge-coupled device
[AD-A072989] N80-11339
CHARGE TRANSFER
Low-loss charge-coupled device
[AD-A072989] N80-11339
CHARGED PARTICLES
Specific spacecraft evaluation: Special report --- charged particle transport from a mercury ion thruster to spacecraft surfaces
[NASA-CR-159420] N80-11137
CHARPY IMPACT TEST
Mechanical properties of modified 9 Cr-1 Mo steel --- charpy impact, tensile, and creep tests performed on steel
[CONF-781219-2] N80-11213
CHARTS
Design of safe electrical equipment for research
[LA-7597-MS] N80-11346
CHELATES
High precision metal stable isotope ratio measurements using volatile metal chelates
[CONF-780501-7] N80-11211
CHELATION
Chromatography of metal ions with a triazine chelating resin
[IS-T-855] N80-11167
CHEMICAL ANALYSIS
Chemical analysis of aerosols and airborne particulates, volume 2. A bibliography with abstracts
[NTIS/PS-79/0791/8] N80-11675
CHEMICAL BONDS
Chemical structures and reactivities of coal as an organic natural product
[CONF-790415-25] N80-11168
CHEMICAL CLEANING
A method for cleaning Gude-Space D96 tape
[ESA-PSS-52/QRM-32P-ISSUE-1] N80-11156
CHEMICAL ENERGY
Conversion of radiant energy into chemical energy
[UCRL-TRANS-11427] N80-11609
Research overview of biological and chemical conversion methods and identification of key research areas for SERI
[SERI/TR-33-067] N80-11617
CHEMICAL ENGINEERING
Chemical engineering division basic energy sciences research
[ANL-78-42] N80-11610
CHEMICAL EQUILIBRIUM
Calculation of chemical equilibrium between aqueous solution and minerals: The EQ3/6 software package
[UCRL-52658] N80-11169
CHEMICAL EXPLOSIONS
Survey of the activities concerning sensitivity test methods for explosives
[PML-1979-20] N80-11253
CHEMICAL LASERS
Advanced laser concepts. Addendum: Production of excited states
[AD-A071393] N80-11436
Modeling studies of the mixing and chemistry of the NF radicals on the tristream nozzle
[AD-A071315] N80-11440
Gas dynamic lasers. A bibliograpy with abstracts
[NTIS/PS-79/0839/5] N80-11467
CHEMICAL REACTIONS
Chemical structures and reactivities of coal as an organic natural product
[CONF-790415-25] N80-11168
Tertiary oil recovery processes research at the University of Texas
[BETC-0001-1] N80-11544
CHEMICAL REACTORS
Laboratory coal gasifier facility
[UCRL-82602] N80-11245
CHEMISORPTION
Structural related research --- physicochemical and mechanical properties of materials
[AD-A071416] N80-11988
CHROMATOGRAPHY
Performance of a gel permeation chromatograph and its usefulness in examining mixtures of organic materials --- epoxy resin aircraft adhesives
[MRL-R-725] N80-11158
CHROMIUM
Spectrally selective surfaces with coatings comprised of ultrafine metal particles --- solar collectors
[AED-CONF-78-212-004] N80-11620
A field study of the relationship between heavy metal concentrations in stream water and selected benthic macroinvertebrate species
[PB-297284/2] N80-11651
CHROMIUM ALLOYS
Mechanical properties and oxidation and corrosion resistance of reduced-chromium 304 stainless steel alloys
[NASA-TP-1557] N80-11188
CIRCUIT BOARDS
Non-noble colloidal catalysts
[AD-A072757] N80-11338
Deleterious effect of fusing fluids on printed wiring boards
[AD-A072716] N80-11341
Electrical compensation system for plated-through-hole tester: Milestone Report
[BDX-613-1943-REV] N80-11354
CIRCUIT RELIABILITY
Controllability/observability analysis of digital circuits --- large scale integration
[SAND-78-1895] N80-11352
CIRCUITS
Rectangular flat-pack lids under external pressure improved formulas for screening and design, revised
[AD-A072421] N80-11329
CITIES
Institutional constraints on land management for water resource protection in urban and suburban watersheds
[PB-298271/8] N80-11549
Predicting solar energy fluxes in polluted urban areas
[UCRL-82080] N80-11698
Hybrid optimization in urban traffic networks
[PB-297146/3] N80-11960
CIVIL AVIATION
Selection of geometric parameters and location of nose flap on swept wing root profile from tunnel test data, 1
N80-11009
AVIONICS: Projections for civil aviation, 1995-2000
[NASA-CR-159035] N80-11079
CLASSICAL MECHANICS
Noether's theory in classical nonconservative mechanics
[CSIR-TWISK-66] N80-11836
CLEAR AIR TURBULENCE
Clear air turbulence. Citations from the international aerospace abstracts data base --- bibliography
[NTIS/PS-79/0858/5] N80-11746
CLIMATOLOGY
OTEC thermal resource report for western coast Mexico --- climate and oceanographic parameters
[HCP/T2898] N80-11600
Global lightning distribution at dawn and dusk for August-December 1977 as observed by the DMSD lighting detector
[AD-A071896] N80-11678
Report of the fifteenth session of the Joint Organizing Committee
N80-11734
A climatological study on the occurrence of easterly gales on the North Atlantic Ocean
[KNMI-WR-79-5] N80-11737
CLINICAL MEDICINE
STARPAHC space-oriented medical evaluation --- telemedicine system
[NASA-CR-160360] N80-11763
A porcine bioassay method for analysis of thermally protective fabrics: A clinical grading system
[AD-A069202] N80-11766
CLOSED CIRCUIT TELEVISION
Microcomputer-based video motion detection system
[Y/DA-7999] N80-11797
CLOUD PHYSICS
Radar echo organization and development in the mesoscale environment: A case study approach
[PB-298444/1] N80-11714
Airborne measurements of cloud forming nuclei and aerosol particles at Kennedy Space Center, Florida
[NASA-CR-160359] N80-11716
CLOUDS [METEOROLOGY]
Radar echo organization and development in the mesoscale environment: A case study approach
[PB-298444/1] N80-11714
Satellite support to HIPLEX: Summary of results, 1976 - 1978
[PB-297839/3] N80-11729
COAL GASIFICATION
Laboratory coal gasifier facility
[UCRL-82602] N80-11245
Economics of gasoline production from underground coal gasification via mobil-M process
[CONF-790405-12] N80-11246
Program to discover materials suitable for service under hostile conditions obtaining in equipment for the gasification of coal and other solid fuels
[FE-1784-42] N80-11248
Assessment of long term research needs for coal-gasification technologies
[PB-297853/4] N80-11255
Two-dimensional transient dispersion and adsorption in porous media
[UCRL-81970] N80-11386
International coal technology summary document
[DOE/PE-0010] N80-11621
Hot gas cleanup
[ICTIS/TR-03] N80-11647
COAL LIQUEFACTION
Chemical structures and reactivities of coal as an organic natural product
[CONF-790415-25] N80-11168
Research and development of rapid hydrogenation for coal conversion to synthetic motor fuels [riser cracking of coal]
[FE-2307-38] N80-11249
International coal technology summary document
[DOE/PE-0010] N80-11621
COAL UTILIZATION
Combustion of low grade coal
[ICTIS/TR-02] N80-11179
Trace elements from coal combustion: Atmospheric emissions
[ICTIS/TR-05] N80-11180
International coal technology summary document
[DOE/PE-0010] N80-11621
Technical assessment of thermal DeNOx process --- for coal fired boilers
[PB-297947/4] N80-11656
COASTAL ECOLOGY
Physical regionalization of coastal ecosystems of the United States and its territories
[PB-297143/0] N80-11661
COASTS
Trace metals and marine production processes --- conference proceedings
[PB-298333/6] N80-11654
COATING
Coating laminated substrates
[BDX-613-2062-REV] N80-11153
COBALT
Pulse plating of hard gold electrodeposits
[BDX-613-2165] N80-11207
COBALT ALLOYS
Hot corrosion degradation of metals and alloy: A unified theory --- nickel and cobalt based alloys
[AD-A072645] N80-11194
Ductility minimum and its reversal with prolonged aging in cobalt-and nickel-base superalloys
[CONF-781202-35] N80-11209
COBALT OXIDES
Catalysis by transition metal compounds --- cobalt oxide
[COO-1198-1234] N80-11217
COCKPITS
Cabin hazards from a large external fuel fire adjacent to an aircraft fuselage
[AD-A073494] N80-11050
COGNITION
Intelligence as an information processing concept
[AD-A069953] N80-11775
COGNITIVE PSYCHOLOGY
Cognitive styles: A review of the literature
[AD-A069435] N80-11772
COHERENT SCATTERING
On the computation of bounds for low energy Compton scattering parameters. Proof of a conjecture
[PM/79/7] N80-11885
COLD PLASMAS
Measurements of electron density and temperature profiles in a gas blanket experiment
[TRITA-PFU-79-03] N80-11915
COLLOIDS
Non-noble colloidal catalysts
[AD-A072757] N80-11338
COLORADO RIVER [NORTH AMERICA]
Energy development vs water quality in the upper Colorado and upper Missouri River Basins
[LA-7497-MS] N80-11641
COMBAT
Development of unit training and evaluation techniques for combat-ready helicopter pilots. Task 2: Assessment of ARTEP and ATM training objectives and requirements for maintaining operational readiness
[AD-A069224] N80-11776
Development of unit training and evaluation techniques for combat-ready helicopter pilots. Task 1: Development of an instruction program for individual and unit training with combat-ready pilots
[AD-A069242] N80-11777
COMBUSTIBLE FLOW
Mixing and combustion in high speed air flows
[AD-A072642] N80-11159
COMBUSTION
Titanium combustion research program and user's manual for deck CCD 1152-0.0
[AD-A072529] N80-11161
Workshop report: Fundamental reactions in solid propellant combustion --- conferences
[AD-A072162] N80-11239
COMBUSTION CHAMBERS
Mixing and combustion in high speed air flows
[AD-A072642] N80-11159
Fundamental characterization of alternate fuel effects in continuous combustion systems
[SAN-1543-12] N80-11244
COMBUSTION PRODUCTS
Trace elements from coal combustion: Atmospheric emissions
[ICTIS/TR-05] N80-11180
COMBUSTION STABILITY
Lectures on combustion theory
[COO-3077-153] N80-11170
COMET NUCLEI
Comets, carbonaceous chondrites, and interstellar clouds: Condensation of carbon
N80-11976
COMETS
Perturbation method on the study of the interaction of the solar wind with comets
[INPE-1529-RPE/061] N80-11944
Space missions to comets
[NASA-CP-2089] N80-11972

Scientific need for a cometary mission
N80-11973
Connections between comets and plasmas in space
N80-11974
Comets: Cosmic connections with carbonaceous meteorites, interstellar molecules and the origin of life
N80-11975
Scientific returns from a program of space missions to comets
N80-11977

COMMAND AND CONTROL
Study of automated command support systems
[AD-A072298] N80-11790

COMMERCIAL AIRCRAFT
New aircraft technology: Report on the Farnborough International Air Show
[PB-298345/0] N80-11078

COMMITTEE ON SPACE RESEARCH
Space research in Sweden, 1978
N80-11993
Space research in Denmark
N80-11994

COMMUNICATION CABLES
Considerations on projects for high capacity and long distance numerical data transmission systems
[FUB-50-1977] N80-11316

COMMUNICATION EQUIPMENT
Planning synthesis for Spacelab projects in communication and navigation
[BMFT-FB-W-78-30] N80-11116

COMMUNICATION NETWORKS
Provisional message formats for the DABS/NAS interface
[AD-A073461] N80-11274
Concepts for 18/30 GHz satellite communication system, volume 1
[NASA-CR-159625-VOL-1] N80-11277
Concepts for 18/30 GHz satellite communication system, volume 1A: Appendix
[NASA-CR-159625-VOL-1A] N80-11278
Concepts for 18/30 GHz satellite communication system study. Executive summary
[NASA-CR-159680] N80-11279
An experimental investigation of the reduction of nonlinear effects using passive compensating networks
[AD-A072422] N80-11284
Categorization and specification requirements for a common family of AUTODIN terminals
[AD-A072164] N80-11287
Integrated Autodin System [IAS]: Generation of viable far-term architectures for IAS
[AD-A072165] N80-11288
Development of a voice funnel system
[AD-A072424] N80-11295
Development of a voice funnel system
[AD-A072423] N80-11296

COMMUNICATION SATELLITES
The RSRE satellite communications test facility
[RSRE-78008] N80-11119
Analytical and experimental evaluation of two designs for a graphite/epoxy antenna feed truss for a communications satellite
[AD-A072484] N80-11151
Satellite broadcasting: Results of a preliminary coverage survey in the UK
[BBC-RD-1979/18] N80-11270
Concepts for 18/30 GHz satellite communication system, volume 1
[NASA-CR-159625-VOL-1] N80-11277
Concepts for 18/30 GHz satellite communication system, volume 1A: Appendix
[NASA-CR-159625-VOL-1A] N80-11278
Concepts for 18/30 GHz satellite communication system study. Executive summary
[NASA-CR-159680] N80-11279
Technology assessment for future MILSATCOM systems: The EHF bands
[AD-A071886] N80-11290
Concept for a worldwide civil maritime satellite communication network [MARSAT]. Operation system study
[BMFT-FB-W-77-13] N80-11313

COMMUNITIES
Heat pump centered integrated community energy systems: Systems development, Dubin-Bloome Associates
[ANL/ICES-TM-29] N80-11572

COMMUTATION
Digital calculation of the commutation characteristics of armature windings
[DRIC-TRANS-5359] N80-11361

COMMUTATORS
On the magnetizing energy balance in electric networks, particularly regarding networks involving machines with commutators
[REPT-1630] N80-11365

COMPLEX NUMBERS
The use of complex numbers in a network flow algorithm
[FUB-49-1977] N80-11824

COMPLEX SYSTEMS
Analytic design of complex systems, 1
N80-11014
Control strategies for complex systems for use in aerospace avionics
[AD-A072540] N80-11081

COMPONENT RELIABILITY
Reliability of packaged beam-lead transistors built with different pre-seal assembly techniques
[BDX-613-1952-REV] N80-11349

COMPOSITE MATERIALS
Engineering design handbook. Joining of advanced composites
[AD-A072362] N80-11148
Characteristics of laser cutting Kevlar laminates
[BDX-613-2075-REV] N80-11456
Failure criteria for reinforced concrete structures. Volume 1: Literature survey and proposed analytical models
[AD-A070643] N80-11510
Failure criteria for reinforced concrete structures. Volume 2: Analytical model and response data
[AD-A070644] N80-11511

COMPOSITE STRUCTURES
A multilayer traction-free edge, quadrilateral, warping element for the stress analysis of composite plates and shells
[AD-A071910] N80-11508

COMPOSITION [PROPERTY]
Isotopic composition of primary cosmic ray nitrogen and oxygen with consequences for source models
[LUIP-7811] N80-11986

COMPRESSED AIR
Evaluation of turbomachinery for compressed air energy storage plants
[CONF-781046-6] N80-11625
Design optimization of aquifer reservoir-based compressed air storage systems
[CONF-781046-5] N80-11628

COMPRESSOR BLADES
Experimental study of low aspect ratio compressor blading
[NASA-TM-79280] N80-11037
Development of improved abradable compressor gas path seal
[AD-A072171] N80-11474

COMPRESSOR EFFICIENCY
Experimental study of low aspect ratio compressor blading
[NASA-TM-79280] N80-11037

COMPRESSORS
The effect of interblade phase angle and solidity on the time variant aerodynamic response of a compressor stator
[AD-A071878] N80-11092

COMPTON EFFECT
On the computation of bounds for low energy Compton scattering parameters: Proof of a conjecture
[PM/79/7] N80-11885

COMPUTATION
The use of computers in solving mathematical problems, volume 2. A bibliography with abstracts
[NTIS/PS-79/0798/3] N80-11799
On the computation of bounds for low energy Compton scattering parameters: Proof of a conjecture
[PM/79/7] N80-11885

COMPUTATIONAL FLUID DYNAMICS
The analysis of wing-body combinations at moderate angles of attack --- missile bodies
[AD-A074284] N80-11040

COMPUTER ASSISTED INSTRUCTION
Computer generation of bivariate gamma random vectors
[AD-A072407] N80-11844

COMPUTER DESIGN
Basic laboratory architecture plan
[AD-A072427] N80-11789
Architecture for higher level digital image processing
[AD-A071599] N80-11832

COMPUTER GRAPHICS
Processing and display techniques for multispectral satellite imagery
[AD-A072509] N80-11534
Interactive water resources planning using computer graphics
[PB-297994/6] N80-11550
A FORTRAN algorithm for plotting contours over a triangular mesh
[AD-A072525] N80-11811
Automatic data processing techniques for graphic-data display, generation and analysis
[AD-A072636] N80-11812
GRAFIT: A generalized graphics package
[AD-A072339] N80-11813
Computer mapping software at the Lawrence Berkeley Laboratory
[LBL-7938] N80-11818

COMPUTER NETWORKS
Message services in computer networks
[AD-A071730] N80-11282
The data banks. What they are and how they are used
N80-11823
The use of complex numbers in a network flow algorithm
[FUB-49-1977] N80-11824
Control procedures in packet switched computer networks: Part 2
[FUB-15-1978-PT-2] N80-11825
Analysis and synthesis problems in dimensioning packet switched networks
[FUB-32-1978] N80-11826

COMPUTER PROGRAMMING
COUPLEFLO: A computer code for coupled creeping viscous flow and conductive-convective heat transfer. Part 1: Theoretical background
[SAND-78-1046-PT-1] N80-11390
A users guide for the Advanced Scientific Computer [ASC]
[AD-A072405] N80-11791
Computer storage management. A bibliography with abstracts
[NTIS/PS-79/0884/1] N80-11800
Preparation guide for class B software specification documents
[NASA-CR-162431] N80-11805
A normative cost-benefit analysis of the systematic design methodology
[AD-A072355] N80-11809
Scheduling parallel processes without a common scheduler --- a systems analysis of computer programming and computer systems design for scheduling parallel processes
[AD-A072158] N80-11814
Zero base budget software
[PB-298732/9] N80-11942

COMPUTER PROGRAMS
Tri-FAST hardware-in-the-loop simulation. Volume 1: Tri-FAST hardware-in-the-loop simulation at advanced simulation center
[AD-A072919] N80-11063
Linear systems analysis program, L224[QR]. Volume 2: Supplemental system design and maintenance document
[NASA-CR-2862] N80-11098
Calculation of chemical equilibrium between aqueous solution and minerals: The EQ3/6 software package
[UCRL-52658] N80-11169
SCHEDULE. Managerial tool for project/product managers
[AD-A072140] N80-11257
Program PSD: Digital determination of power spectral densities of random signals
[CSIR-ME-1594] N80-11276
Numerical solution of turbulent flow problems in general geometry
[KAPL-4116] N80-11382
COUPLEFLO: A computer program for coupled creeping viscous flow and conductive-convective heat transfer. Part 2: user's manual
[SAND-78-1407] N80-11385
Comparisons of RETRAN and two-velocity two-phase flow models with experimental data
[EPRI-NP-928] N80-11392
SAMICS: Input data preparation --- Solar Array Manufacturing Industry Costing Standards
[NASA-CR-162421] N80-11570
An investigation of a mathematical model for atmospheric absorption spectra
[NASA-CR-162430] N80-11677
SOILST: A computer program for soil-structure interactions analysis
[GA-A-15067] N80-11700
Spectral radiometric measurement and analysis program. Volume 4: SCAT3 operator's manual
[AD-A072081] N80-11720
Spectral radiometric measurement and analysis program. Volume 3: Data analysis and formulation of the model
[AD-A072080] N80-11721
A comparison of low-cost microprocessors for the GPS receiver processor
[AD-A072632] N80-11793
Preparation guide for class B software specification documents
[NASA-CR-162431] N80-11805
On software reliability modeling
[AD-A072420] N80-11807
Validation of software reliability models
[AD-A072113] N80-11810
Automatic data processing techniques for graphic-data display, generation and analysis
[AD-A072636] N80-11812
MDSFP: A computer program for elastic solution of three dimensional structures by the finite element method [LWBR development program]
[WAPD-TM-1187] N80-11816
Future trends in data base software
[UCRL-82619] N80-11817
Computer mapping software at the Lawrence Berkeley Laboratory
[LBL-7938] N80-11818
User's manual for the computer program TODEP --- two dimensional wave propagation
[FOA-C-20308-D4] N80-11822
A survey of electric and hybrid vehicle simulation programs
[NASA-CR-162457] N80-11954

COMPUTER STORAGE DEVICES
Computer storage management. A bibliography with abstracts
[NTIS/PS-79/0884/1] N80-11800

COMPUTER SYSTEMS DESIGN
Avionics master plan data base mechanization architecture
[AD-A071545] N80-11083
Toward automating the database design process
[SAND-79-0858C] N80-11794

Influence of microprocessor technology on instrument and system design
[CONF-790525-1] N80-11796
NASA software specification and evaluation system design
[NASA-CR-161335] N80-11806
Scheduling parallel processes without a common scheduler --- a systems analysis of computer programming and computer systems design for scheduling parallel processes
[AD-A072158] N80-11814

COMPUTER SYSTEMS PROGRAMS
What will your time series analysis computer package do? Computer packages
[CONF-7805149-2] N80-11795
Data analysis software for the autoradiographic enhancement process. Volumes 1, 2, and 3, and appendix
[NASA-CR-161327] N80-11804
NASA software specification and evaluation system design
[NASA-CR-161335] N80-11806

COMPUTER TECHNIQUES
Analysis and synthesis of operational loads
[RAE-LIB-TRANS-2008] N80-11504
Relaxation applied to matching quantitative relational structures
[AD-A071604] N80-11808

COMPUTERIZED DESIGN
Solution of the inverse aerodynamics problem by the random search method
N80-11013
One dimensional design of centrifugal compressors taking into account flow separation in the impeller
[VKI-TN-129] N80-11486
Toward automating the database design process
[SAND-79-0858C] N80-11794
An interactive framework for design automation
[UPTEC-78-47-R] N80-11821

COMPUTERIZED SIMULATION
Air traffic control simulation models volume 2. A bibliography with abstracts
[NTIS/PS-79/0799/1] N80-11062
Opportunistic Maintenance Engine Simulation model: OMENS 2
[AD-A072516] N80-11088
Evaluation of transponder antenna coverage/ATCRBS during simulated flights of aircraft
[AD-A073547] N80-11275
Computer simulation of tire slip on a clayton twin roll dynamometer
[PB-297764/3] N80-11488
Analysis and synthesis of operational loads
[RAE-LIB-TRANS-2008] N80-11504
Wind shear hazard definition for a wide body jet --- low level wind shear and control simulation
[FAA-RD-79-90] N80-11715
Computer generation of bivariate gamma random vectors
[AD-A072407] N80-11844
On the use of finite element method on some acoustical problems
[D4-1979] N80-11875
A survey of electric and hybrid vehicle simulation programs
[NASA-CR-162457] N80-11954

COMPUTERS
Blackouts and brownouts and their effect on computer operations
[BNL-24960] N80-11798

CONCENTRATION
Bell Creek residual oil saturation technology test
[BETC-2180-4] N80-11546

CONCENTRATION [COMPOSITION]
Rheology of concentrated suspensions
N80-11178
The smeared concentration approximation method: A simplified air pollution dispersion methodology for regional analysis
[IIASA-RR-78-9] N80-11635
Air quality maintenance analysis for New Jersey-New York and mid-Hudson AQMA
[PB-297988/8] N80-11655
Scientific need for a cometary mission
N80-11973

CONCENTRATORS
Concentrating solar collector test results Collector Module Test Facility [CMTF]
[SAND-78-0977] N80-11580
Solar parabolic trough forming process
[ALO-4158-1] N80-11626

CONCRETES
A model for nonlinear creep of concrete
[ISD-REPT-246] N80-11263
Analysis of pavement systems
[PB-298098/5] N80-11268
Failure criteria for reinforced concrete structures. Volume 1: Literature survey and proposed analytical models
[AD-A070643] N80-11510
Failure criteria for reinforced concrete structures. Volume 2: Analytical model and response data
[AD-A070644] N80-11511

CONDENSATES
Field test of the stabilization of supersized water droplets condensed on pyrotechnically generated hygroscopic nuclei
[AD-A073035] N80-11724

CONDENSING
Mobile bed flux force/condensation scrubbers --- air pollution control
[PB-297198/4] N80-11657

CONDUCTIVE HEAT TRANSFER
Aerodynamic heating of blunt wedges
N80-11008
COUPLEFLO: A computer program for coupled creeping viscous flow and conductive-convective heat transfer. Part 2: user's manual
[SAND-78-1407] N80-11285

CONDUCTORS
Preliminary dielectric studies. Spir-o-line cable for application at power frequencies
[HCP/T5054-01] N80-11351

CONES
The response of a turbulent boundary layer to lateral divergence
[IC-AERO-78-03] N80-11394

CONFERENCES
Workshop report: Fundamental reactions in solid propellant combustion --- conferences
[AD-A072162] N80-11239
Proceedings of the 28th Meeting of the Mechanical prevention group, Report on MFPG detection, diagnosis, and prognosis
[NASA-TM-80881] N80-11502
Behaviour of steel under cyclic loading --- conference
[ICAF-1090] N80-11503
Increased energy from biomass: 1985 possibilities and problem. Working papers for planners
[RLO-788-5] N80-11589
Proceedings: Solar Thermal Power User Review Panel Meeting
[SERI/TP-69-221] N80-11598
Meteorology and the human environment
[WMO-577] N80-11643
Trace metals and marine production processes --- conference proceedings
[PB-298333/6] N80-11654
Informal conference on Status and Future of Solar Neutrino Research; proceedings
[BNL-50879-VOL-2] N80-11890
Automated Document Retrieval Workshop
[HEDL-SA-1628] N80-11947
Directions to improve urban travel demand forecasting: Conference summary and white papers
[PB-297409/5] N80-11959
Southeastern forum on appropriate technology
[PB-298796/4] N80-11965
Space missions to comets
[NASA-CP-2089] N80-11972
Support of small research projects in materials science at universities
[AD-A071940] N80-11989

CONFIDENCE LIMITS
On sequential confidence intervals for the largest normal mean
[AD-A072599] N80-11856

CONGRESSIONAL REPORTS
Earth resources data and information service
[GPO-49-530] N80-11530
Solar commercialization
[GPO-43-586] N80-11556
Energy initiatives of the 95th Congress
[GPO-42-797] N80-11557
Lack of accountability in Government public information and publishing programs
[GPO-45-775] N80-11943
NASA authorization for fiscal year 1980
[S-REPT-96-207] N80-11951
Small transport aircraft technology. A report for the committee on commerce, science, and transportation, United States Senate
[NASA-TM-80813] N80-11953

CONICAL BODIES
An experimental survey of a separated region on a conical afterbody in a supersonic free stream
[FFA-TN-AU-1187] N80-11047

CONNECTICUT
Determinations of hydrologic parameters for glacial tills in Connecticut
[PB-297578/7] N80-11548

CONSERVATION LAWS
An implicit compact fourth-order algorithm for solving the shallow-water equations in conservation-law form
[CSIR-TWISK-57] N80-11531

CONSTRAINTS
On the computation of bounds for low energy Compton scattering parameters: Proof of a conjecture
[PM/79/7] N80-11885

CONSTRUCTION
Space Construction Automated Fabrication Experiment Definition Study. [SCAFEDS], part 3. Volume 1: Executive summary
[NASA-CR-160345] N80-11111

CONSUMERS
Status of information for consumers of small wind energy systems
[SERI/TP-51-158] N80-11602
Demand management demonstration project. Stage 1: Development of residential load characteristics. Stage 4: Demonstration of residential incremental cost pricing implemented by time-of-day metering
[HCP/B8072-01] N80-11941

CONTAINERS
Assessment of stress-strain data suitable for finite-element elastic-plastic analysis of shipping containers
[NUREG-CR-0481] N80-11520

CONTAMINANTS
X-ray excited optical luminescence of polynuclear aromatic hydrocarbons
[IS-T-856] N80-11165
Sampling and analysis of the aquatic environment in POTW's and their vicinity
[PB-297606/6] N80-11963

CONTINENTAL SHELVES
Long wave coupling of the mid and south Atlantic bights forced by the atmosphere
[AD-A072282] N80-11749
Environmental studies of the south Texas outer continental shelf, 1977. Ichthyoplankton/Mackerel Eggs and larvae
[PB-296647/1] N80-11753
Environmental studies of the South Texas continental shelf, 1976 - 1977. Historical zooplankton
[PB-296646/3] N80-11754
Environmental studies of the south Texas continental shelf. Snapper/Grouper
[PB-296645/5] N80-11755

CONTINUOUS WAVE LASERS
Appendix B: Lasers of potential use for shuttle lidar
N80-11426
Dye lasers. Citations from the international aerospace abstracts data base
[NTIS/PS-79/0823/9] N80-11460

CONTINUUM MECHANICS
New computational models in continuum mechanics
[AD-A071418] N80-11041

CONTOURS
Solution of the inverse aerodynamics problem by the random search method
N80-11013
Numerical integration of equations of theory of thin-wall beams with deformable contour
N80-11018
The effect of short regions of high surface curvature on turbulent boundary layers --- in a low speed wing tunnel
[IC-AERO-78-02] N80-11393
Turbulent boundary layers on surfaces of mild longitudinal curvature --- in a low speed wind tunnel
[IC-AERO-78-04] N80-11395
A FORTRAN algorithm for plotting contours over a triangular mesh
[AD-A072525] N80-11811
A closed-form solution for noise contours
[NASA-TP-1432] N80-11869
Activities report of the Image Laboratory
[ENST-D-79005] N80-11901

CONTROL
Control strategies for complex systems for use in aerospace avionics
[AD-A072540] N80-11081
Carbon dioxide contributions in respiratory control
N80-11760

CONTROL SIMULATION
Distributed source generation for RF environmental modeling for hardware-in-the-loop missile guidance simulation
[AD-A072927] N80-11126
Wind shear hazard definition for a wide body jet --- low level wind shear and control simulation
[FAA-RD-79-90] N80-11715

CONTROL STABILITY
Aircraft control by propeller cyclic blades
[NASA-CR-3212] N80-11031

CONTROL THEORY
Analytic design of complex systems, I
N80-11014
Inequalities and approximation with applications to VSTOL aircraft --- using control theory for optimal control approximations
[AD-A071807] N80-11099
Entropy analysis of feedback flight dynamic control systems
[AD-A072259] N80-11100
Minimum l-p-norm controls for time-varying linear dynamic systems
[CSIR-TWISK-49] N80-11828
Control of nonlinear systems
[AD-A072635] N80-11829
Measure-valued processes in the control of partially-observable Stochastic systems
[AD-A072070] N80-11830
An approximation technique for small noise open loop control problems
[AD-A072638] N80-11849
A summary of spectral synthesis procedures for multivariable systems
[NASA-CR-162436] N80-11862

CONTROLLERS
Aircrew displays and avionics for application in a future national airspace system
[NASA-TM-80095] N80-11052
Linear state feedback control of rigid-link manipulators
[UTIAS-TN-214] N80-11779

CONVECTION
Is the sun constant?
[ATR-79[9552]-4] N80-11981

CONVECTIVE HEAT TRANSFER
Radiative and free convective heat transfer from a containerless sphere
[NASA-TM-78249] N80-11377
COUPLEFLO: A computer program for coupled creeping viscous flow and conductive-convective heat transfer. Part 2: user's manual
[SAND-78-1407] N80-11385
COUPLEFLO: A computer code for coupled creeping viscous flow and conductive-convective heat transfer. Part 1: Theoretical background
[SAND-78-1046-PT-1] N80-11390
CONVEXITY
Augmented restricted Lagrangians in convex programming
[CSIR-TWISK-62] N80-11802
COOLANTS
Influence of coolant tube curvature on film cooling effectiveness as detected by infrared imagery
[NASA-TP-1546] N80-11087
COOLING
Influence of coolant tube curvature on film cooling effectiveness as detected by infrared imagery
[NASA-TP-1546] N80-11087
Cooling aluminum molds using heat pipes
[BDX-613-2039-REV] N80-11384
Composition stability and degradation products of selected materials for solar heating and cooling
[SAND-78-0681] N80-11591
COOLING SYSTEMS
Heat transfer correlation development and assessment: A summary and assessment of return to nucleate boiling phenomena during blowdown tests conducted at the Idaho National Engineering Laboratory [INEL]
[CDAP-TR-054] N80-11387
High COP heat pump system, phase 1, results
[HCP/M5056-01] N80-11573
Heat pump centered integrated community energy system; system development
[ANL/ICES-TM-31] N80-11575
Environmental effects of heat and moisture release from atmospheric spray cooling systems
[CONF-780520-7] N80-11642
COORDINATES
Phase space coordinates of long lifetime trapped radiation from Stoermer Mapping
[AD-A072995] N80-11694
COPOLYMERS
Toxicity and thermal properties of polyphosphazenes
[AD-A072120] N80-11228
COPPER
Strain rate effects on ultimate strain of copper
[AD-A072175] N80-11192
Non-noble colloidal catalysts
[AD-A072757] N80-11338
COPPER ALLOYS
The deposition of gold - copper - cadmium alloys
[DRIC-TRANS-5465] N80-11218
CORPUSCULAR RADIATION
Discrete multivariate analysis on radiobiological results from the biostack 3 Bacillus subtilis experiment N80-11759
CORROSION RESISTANCE
Corrosion resistant thermal barrier coating --- protecting gas turbines and other heat engine parts
[NASA-CASE-LEW-13088-1] N80-11142
Mechanical properties and oxidation and corrosion resistance of reduced-chromium 304 stainless steel alloys
[NASA-TP-1557] N80-11188
Hot corrosion degradation of metals and alloy: A unified theory --- nickel and cobalt based alloys
[AD-A072645] N80-11194
Corrosion fatigue of a marine aluminum alloy [5456-H343] in the presence of shallow cracks
[AD-A072562] N80-11195
Program to discover materials suitable for service under hostile conditions obtaining in equipment for the gasification of coal and other solid fuels
[FE-1784-42] N80-11248
CORROSION TESTS
Preliminary materials assessment in solar demonstration systems
[ANL/EES-CP-30] N80-11619
COSMIC RAYS
Space research in the Netherlands, 1978 N80-11996
COSMOLOGY
Comets: Cosmic connections with carbonaceous meteorites, interstellar molecules and the origin of life N80-11975
COSMOS SATELLITES
Analysis of beryllium parts for cosmos 954
[UCRL-52597] N80-11127
The effect of the magnetosphere processes on the ionosphere during the magnetic storm of December 1, 1977 based on the Cosmos-900 data
[D-277] N80-11709
COST ANALYSIS
The use of the Maurer factor for estimating the cost of a turbine engine in the early stages of development
[AD-A073018] N80-11095
A normative cost-benefit analysis of the systematic design methodology
[AD-A072355] N80-11809
COST EFFECTIVENESS
Geometrics, hydraulics, and hydrology
[PB-298102/5] N80-11269
System reliability and component costs. A correlation of component quality, failure rate, and redundancy parameters
[ECR-79] N80-11498
The automated array assembly task of the low-cost silicon solar array project, phase 2
[NASA-CR-162429] N80-11562
Cost-effective technology advancement directions for electric propulsion transportation systems in earth-orbital missions
[NASA-TM-79289] N80-11950
COST ESTIMATES
The use of the Maurer factor for estimating the cost of a turbine engine in the early stages of development
[AD-A073018] N80-11095
Economic of hydrogen production and liquefaction updated to 1980
[NASA-CR-159163] N80-11238
COSTS
SAMICS: Input data preparation --- Solar Array Manufacturing Industry Costing Standards
[NASA-CR-162421] N80-11570
Demand management demonstration project. Stage 1: Development of residential load characteristics. Stage 4: Demonstration of residential incremental cost pricing implemented by time-of-day metering
[HCP/B8072-01] N80-11941
COUPLED MODES
Inductively coupled plasma-atomic emission spectroscopy: An evaluation of the use of nitrogen-argon admixtures as plasma discharge atmospheres N80-11177
On the existence and stability of trapped Langmuir modes in a double layer
[UPTEC-78-89-R] N80-11918
COUPLERS
Investigation of a multimode fiber optic coupler
[AD-A071874] N80-11896
COVARIANCE
A covariance approximation procedure --- for geodetic data processing
[AD-A072853] N80-11541
CRACK PROPAGATION
Improved methods for predicting spectrum loading effects, phase 1 report, volume 2: Test data
[AD-A072387] N80-11070
Improved methods for predicting spectrum loading effects, phase 1 report, Volume 1: Results and discussion
[AD-A072386] N80-11071
Effect of multiaxial loading on crack growth. Volume 3: Compilation of interferometry photographs
[AD-A072074] N80-11512
Effect of multiaxial loading on crack growth. Volume 1: Technical summary
[AD-A072122] N80-11513
Specimen size considerations in fatigue-crack growth rate testing
[HEDL-TME-78-99] N80-11521
Flight simulation fatigue crack propagation evaluation of candidate lower wing skin materials with particular consideration of spectrum truncation
[NLR-TR-77092-U] N80-11524
CRACKING [FRACTURING]
Effects of impurities on the weldability of electroformed nickel
[NASA-CR-162455] N80-11214
CRASH LANDING
Light airplane crash tests at three pitch angles
[NASA-TP-1481] N80-11505
CREEP ANALYSIS
A model for nonlinear creep of concrete
[ISD-REPT-246] N80-11263
Elastic-plastic-creep analysis of shells
[CONF-790402-16] N80-11517
CREEP PROPERTIES
Tensile and creep properties of type 316 stainless steel
[CONF-781219-3] N80-11212
COUPLEFLO: A computer code for coupled creeping viscous flow and conductive-convective heat transfer. Part 1: Theoretical background
[SAND-78-1046-PT-1] N80-11390
CREEP RUPTURE STRENGTH
Stress-rupture life of Kevlar/epoxy spherical pressure vessels
[UCID-17755-PT-3] N80-11515
CREEP TESTS
Mechanical properties of modified 9 Cr-1 Mo steel --- charpy impact, tensile, and creep tests performed on steel
[CONF-781219-2] N80-11213
CROSS CORRELATION
Measurements of turbulence parameters in a rocket engine exhaust using a laser crossed beam correlation technique
[AASU-340] N80-11140
System reliability and component costs. A correlation of component quality, failure rate, and redundancy parameters
[ECR-79] N80-11498
CROSSED FIELD AMPLIFIERS
1/3 band low-cost crossed-field amplifier
[AD-A072311] N80-11330
CRUDE OIL
Oil recovery by carbon dioxide injection --- West Virginia
[ORO-5301-34] N80-11545
Bell Creek residual oil saturation technology test
[BETC-2180-4] N80-11546
Standby conservation plan no. 2: Emergency building temperature restrictions. Economic analysis
[DOE/ERA-0047] N80-11593
CRYODEPOSITS
Infrared optical properties of bipropellant cryocontaminants
[AD-A073186] N80-11242
CRYOGENIC WIND TUNNELS
Experimental feasibility study of the application of magnetic suspension techniques to large-scale aerodynamic test facilities --- cryogenic traonics wind tunnel
[NASA-CR-146761] N80-11102
Data acquisition systems for the hypersonic gun and nitrogen wind tunnels
[IC-AERO-79-03] N80-11109
CRYSTAL DISLOCATIONS
The effect of crystal growth direction on the energy resolution of high-purity germanium detectors --- radiation detectors
[LBL-8133] N80-11928
CRYSTAL FILTERS
Design of a tunable high-Q superconducting notch filter
[ANL-78-91] N80-11358
CRYSTAL GROWTH
Ellipsometry of anodic film growth
[LBL-8082] N80-11927
Crystal growth from the vapor phase with an inert component present
[D-268] N80-11933
Investigation of the structure of Te-Se solid solutions obtained in different gravity conditions onboard the Salyut-6 station and in the centrifuge
[D-269] N80-11934
CRYSTAL LATTICES
Acoustic emission from hydrogen saturated type 304L stainless steel
[DP-MS-78-50] N80-11208
CRYSTAL OSCILLATORS
Development and evaluation of an experimental parametric acoustic receiving array [PARRAY]
[AD-A072307] N80-11873
CRYSTAL STRUCTURE
Structural study of high temperature metal-rich titanium sulfide phases
[IS-T-832] N80-11216
CRYSTALLIZATION
Further measurements of the specific heats at low temperatures in metallic glasses
[UCRL-13908] N80-11231
Zone crystallization under zero gravity
[BMFT-FB-W-77-12] N80-11929
CURING
Potential chemical systems for intramolecular cycloaddition cures
[AD-A072526] N80-11152
Exploratory research on novel ambient temperature curing techniques for adhesives, sealants and laminates
[AD-A072591] N80-11227
CURIUM ISOTOPES
Solution microcalorimeter for measuring heats of solution of radioactive elements and compounds
[ORO-4447-081] N80-11405
CURRENT REGULATORS
A method for temperature stabilization of current generators and zenerdiodes
[UPTEC-78-76-R] N80-11366
CURVE FITTING
Method of moments as the least squares solution for fitting a polynomial
[AD-A072357] N80-11845
CUTTERS
Characteristics of laser cutting Kevlar laminates
[BDX-613-2075-REV] N80-11456
Laser cutting and machining: Nonmetals. Citations from the Engineering Index data base --- bibliography with abstracts
[NTIS/PS-79/0891/6] N80-11464
Hobbing ratchet wheels for miniature mechanisms
[BDX-613-1927-REV] N80-11476
CYCLES
Simulation of land-use patterns affecting the global carbon cycle
[ORNL/TM-6651] N80-11701
CYCLIC HYDROCARBONS
Potential chemical systems for intramolecular cycloaddition cures
[AD-A072526] N80-11152
CYCLIC LOADS
Behaviour of steel under cyclic loading --- conference
[ICAF-1090] N80-11503
CYCLOGENESIS
Convection induced temperature change in GATE
[PB-298130/6] N80-11712
Major midwest snowstorms
[AD-A072746] N80-11723
CYCLONES
Objective use of satellite data due to forecast changes in intensity of tropical disturbances
[PB-298915/0] N80-11744

CYCLOTRON RESONANCE
Rigorous derivation of general dispersion relationship for gyrotron
[AD-A072005] N80-11438
Resonance and cut-off surfaces in the ion cyclotron frequency range in toroidal geometry
[TRITA-PFU-79-04] N80-11916
CYLINDRICAL BODIES
Numerical integration of equations of theory of thin-wall beams with deformable contour
N80-11018
Supersonic flow measurements in the body vortex wake of an Ogive nose cylinder
[AD-A071337] N80-11039
CYLINDRICAL SHELLS
Experimental study of shell stability under heating and loading
N80-11003
Load-carrying ability of cylindrical shell loaded by concentrated force acting along the generator
N80-11017
Influence of contour deformation in prebuckling state on bending stability of open cylindrical shells
N80-11025
Explosive technique for asisymmetric expansion of cylinders at high strain rates
[SAND-78-2393] N80-11261

D

D REGION
Aeronomical sounding rocket program. Results of the foil cloud experiment flown on the payload B1 of the National Aeronomy Program Winter Anomaly and Trace Constituents at El Aernosillo, Spain, December 1975 to February 1976
[BMFT-FB-W-78-16] N80-11703
DAMAGE
Dynamic response of damaged angleplied fiber composites
[NASA-TM-79281] N80-11145
DATA ACQUISITION
Data acquisition systems for the hypersonic gun and nitrogen wind tunnels
[IC-AERO-79-03] N80-11109
Some methods for identification of linear systems with noisy input output data
[UPTEC-78-73-R] N80-11315
The 19305A GSRS missile number 1025, round number V-33
[AD-A071894] N80-11718
The 19305A GSRS missile number 1055 round number V-31
[AD-A071880] N80-11719
First session of the WAMEX scientific and management regional committee
[GARP-SPEC-REPT-31] N80-11731
Report of the fifteenth session of the Joint Organizing Committee
N80-11734
DATA BASES
Avionics master plan data base mechanization architecture
[AD-A071545] N80-11083
Scientific objective 4: Meteorological data
N80-11419
World Energy Data System [WENDS]
[CONF-790461-2] N80-11587
Disaggregating PIES fuel forecasts, validating PIES transportation model data base, and other technical services
[TID-29000] N80-11612
Toward automating the database design process
[SAND-79-0858C] N80-11794
Future trends in data base software
[UCRL-82619] N80-11817
The data banks. What they are and how they are used
N80-11823
A manual for cataloging and indexing documents --- geothermal energy data base
[LBL-4432-REV-1] N80-11946
DATA COMPRESSION
Time encoded spatial display. Time-compressed display system uses solid-state components and data compression techniques for image processing, storage, and retrieval
[AD-A072128] N80-11301
DATA LINKS
Precipitation and multipath effects on propagation phenomena. System characteristics and transmission quality of numerical radio links with and without frequency reuse
[FUB-29-1978] N80-11321
DATA MANAGEMENT
Report of the fifteenth session of the Joint Organizing Committee
N80-11734
DATA PROCESSING
Integrated Autodin System [IAS]: Generation of viable far-term architectures for IAS
[AD-A072165] N80-11288
A covariance approximation procedure --- for geodetic data processing
[AD-A072853] N80-11541
Objective use of satellite data due to forecast changes in intensity of tropical disturbances
[PB-298915/0] N80-11744
What will your time series analysis computer package do? Computer packages
[CONF-7805149-2] N80-11795
Data analysis software for the autoradiographic enhancement process. Volumes 1, 2, and 3, and appendix
[NASA-CR-161327] N80-11804
Automatic data processing techniques for graphic-data display, generation and analysis
[AD-A072636] N80-11812
DATA PROCESSING EQUIPMENT
A users guide for the Advanced Scientific Computer [ASC]
[AD-A072405] N80-11791
Report on Finnish technological activities
N80-11991
DATA RECORDERS
The 10 to the 8th power bit solid state spacecraft data recorder --- utilizing bubble domain memory technology
[NASA-CR-3182] N80-11136
DATA RECORDING
Design of an experimental program for evaluation of LBR systems
[AD-A071526] N80-11433
DATA REDUCTION
Study of temperature/moisture retrieval capabilities of DMSP/SSH sensor channels
[AD-A073144] N80-11542
Objective use of satellite data due to forecast changes in intensity of tropical disturbances
[PB-298915/0] N80-11744
DATA RETRIEVAL
The data banks. What they are and how they are used
N80-11823
DATA TRANSMISSION
Concepts for 18/30 GHz satellite communication system, volume 1
[NASA-CR-159625-VOL-1] N80-11277
Concepts for 18/30 GHz satellite communication system, volume 1A: Appendix
[NASA-CR-159625-VOL-1A] N80-11278
Concepts for 18/30 GHz satellite communication system study. Executive summary
[NASA-CR-159680] N80-11279
Intelligent bandwidth compression
[AD-A071692] N80-11283
Considerations on projects for high capacity and long distance numerical data transmission systems
[FUB-50-1977] N80-11316
DECAY RATES
Measurement of fluorescence decay times of laser dyes, 1. Behavior of rigid and mobile media with respect to signal extraction and signal propagation, 2
[UCRL-81568] N80-11451
DECISION MAKING
Implementing energy conservation strategies in energy materials transport: U. S. Department of Energy and other government agency policy-making decisions
[ANL/EES-TM-32] N80-11577
Study of automated command support systems
[AD-A072298] N80-11790
Aspects of a multi-criterion secretary problem
[CSIR-TWISK-42] N80-11835
DECOMPOSITION
Study by elastic theory of the clustering of solute atoms during the early stage of solid solution decomposition --- using strain energy method martensite
[LBL-7680] N80-11880
DECOMPRESSION SICKNESS
Early diagnosis of decompression sickness. Changes in the blood found shortly after decompression. Experiments on rats
[MBL-1978-7] N80-11758
DEFECTS
A phenomenological mechanism for the occurrence of the extrusion central burst defect
[AD-A072476] N80-11197
Exploratory development of adhesive band flaw detection
[AD-A072724] N80-11496
DEFLECTION
Influence of wing deformation on trailing-edge flap deflections
N80-11012
DEFORMATION
Classical analyses of laminated bimodulus composite-material plates
[AD-A072276] N80-11147
Discontinuous deformation gradients in the finite twisting of an incompressible elastic tube
[AD-A071728] N80-11507
DEGRADATION
Static elimination work stations --- to protect semiconductor devices
[BDX-613-1953-REV] N80-11355
DELAY LINES
Low-loss charge-coupled device
[AD-A072989] N80-11339
DELTA WINGS
Overall aerodynamic characteristics of caret and delta wings at supersonic speeds
N80-11022
Leading edge vortex-flap experiments on a 74 deg delta wing
[NASA-CR-159161] N80-11038
DEMAND [ECONOMICS]
Demand management demonstration project. Stage 1: Development of residential load characteristics. Stage 4: Demonstration of residential incremental cost pricing implemented by time-of-day metering
[HCP/B8072-01] N80-11941
Development of a model of the demand for scientific and technical information services
[PB-297826/0] N80-11948
DENMARK
Space research in Denmark
N80-11994
DENSE PLASMAS
Oxidation of gallium arsenide in a plasma multiple device. Study of the MOS structures obtained
[LEP-79/62.SME-687-A] N80-11181
DESALINIZATION
High flux PBI reverse osmosis membranes for desalination and water reuse
[PB-297285/9] N80-11184
DESIGN ANALYSIS
Pallet-only configuration improvement study: Technical summary report
[RAE-TP-7717] N80-11132
Considerations on projects for high capacity and long distance numerical data transmission systems
[FUB-50-1977] N80-11316
Development of a 3 MV pulse transformer
[SAND-79-0813] N80-11344
Quartz resonator pressure gauge: Design and fabrication technology
[SAND-78-2264] N80-11403
Design of a high precision dilatometer using laser interferometry
[SAND-78-1796] N80-11407
Off-design performance prediction of radial inflow turbines, volume 2
N80-11479
Simplified inelastic analysis in helical coil heat exchanger design
[GA-A-15188] N80-11518
Heat loss reduction techniques for annular solar receiver designs
[SAND-78-1769] N80-11581
Design optimization of aquifer reservoir-based compressed air storage systems
[CONF-781046-5] N80-11628
DESORPTION
Investigations of intermetallic alloy hydriding mechanism
[ORO-5246-3] N80-11202
DETECTORS
Small conductive particle sensor
[NASA-CASE-LAR-12552-1] N80-11400
DETONATION WAVES
High explosive detonation and electromagnetic interaction
[AD-A072577] N80-11285
DETONATORS
Detonation of explosives using semiconducting layers
[PUBL-368] N80-11252
DEUTERIUM
Partial molar volumes of hydrogen and deuterium in niobium and vanadium
[IS-T-839] N80-11172
DF LASERS
Hydrogen flouride and deuterium fluoride lasers. Citations from the international aerospace abstracts data base
[NTIS/PS-79/0860/1] N80-11463
DIELECTRIC PROPERTIES
Preliminary dielectric studies. Spir-o-line cable for application at power frequencies
[HCP/T5054-01] N80-11351
DIELECTRICS
Electrical properties of solid insulators as a function of temperature and pressure --- submarine telephone cables
[PUBL-364] N80-11364
DIFFERENCE EQUATIONS
Differential difference evolution equations. Part 2: Darboux transformation for the Toda lattice
[PM/79/11] N80-11932
DIFFERENTIAL EQUATIONS
Runge-Katta starters for multistep methods
[COO-2383-0053] N80-11391
The use of computers in solving mathematical problems, volume 2. A bibliography with abstracts
[NTIS/PS-79/0798/3] N80-11799
SENS: A package of FORTRAN subroutines for functional sensitivity analysis of systems of ordinary differential equations
[CSIR-SWISK-8] N80-11801
Functional sensitivity for ordinary differential equations
[CSIR-TWISK-65] N80-11837
Lie-group theory for symbolic integration of first-order differential equations. A modern treatment
[LA-UR-79-251] N80-11865
Differential difference evolution equations. Part 2: Darboux transformation for the Toda lattice
[PM/79/11] N80-11932

DIFFUSION COEFFICIENT
Measurement of diffusion coefficients of short-lived species in solution and in amorphous glasses
[NVO-0535-7] N80-11236
DIFFUSION FLAMES
Local turbulence properties in flames from time-averaged Raman spectroscopy measurements
[SAND-78-1263C] N80-11171
DIGITAL COMPUTERS
Electronics research at the University of Texas at Austin
[AD-A072436] N80-11987
DIGITAL FILTERS
Long-term instability problems in adaptive noise-cancelers
[SAND-78-1032] N80-11311
DIGITAL INTEGRATORS
Controllability/observability analysis of digital circuits — large scale integration
[SAND-78-1895] N80-11352
DIGITAL NAVIGATION
Study for incorporating time-synchronized approach control into the CH-47/VALT digital navigation system
[NASA-CR-159151] N80-11058
DIGITAL SIMULATION
Comparison of boundary layer calculation for a wing: The May 1978 Stocholm workshop test case — computerized simulation
[FFA-AE-1522] N80-11046
Tri-FAST hardware-in-the-loop simulation. Volume 1: Tri-FAST hardware-in-the-loop simulation at advanced simulation center
[AD-A072919] N80-11063
A method for evaluating aircraft take-off performance
[REPT-1663] N80-11076
Digital calculation of the commutation characteristics of armature windings
[DRIC-TRANS-5359] N80-11361
MEDEE 2: A model for long term energy demand evaluation
[IIASA-RR-78-17] N80-11554
User's manual for the computer program TODEP — two dimensional wave propagation
[FOA-C-20308-D4] N80-11822
DIGITAL SYSTEMS
Evaluation of data technology applied to the integrated navigation system of a tactical transport
[AD-A073068] N80-11061
A fault tolerance assessment of data — failure analysis in digital information systems using error functions
[AD-A072450] N80-11082
Digital sound: Sampling-rate synchronisation by variable delay
[BBC-RD-1979/17] N80-11271
Controllability/observability analysis of digital circuits — large scale integration
[SAND-78-1895] N80-11352
One shots and alternatives in synchronous digital system design — undesirable features of monostable multivibrators
[LBL-8722] N80-11353
Satellite support to HIPLEX. Summary of results, 1976 - 1978
[PB-297839/3] N80-11729
Theory and applications of generalized Walsh functions in digital systems
[AD-A072511] N80-11864
DIGITAL TECHNIQUES
Program PSD: Digital determination of power spectral densities of random signals
[CSIR-ME-1594] N80-11276
DIMERS
Ion photofragment spectroscopy: Potential surfaces of molecular ions
[AD-A073000] N80-11879
DIODES
High average power broadband electron-bombarded semiconductor EBS amplifier
[AD-A072533] N80-11331
DIRECT CURRENT
Some dc superconducting cables — for underground power transmission
[LA-UR-79-1057] N80-11348
A simple pulse peak detector
[RAE-TM-DW-10] N80-11369
DISCRETE ADDRESS BEACON SYSTEM
Provisional message formats for the DABS/NAS interface
[AD-A073461] N80-11274
DISPENSERS
Systems analysis of arctic fuels dispensing equipment
[AD-A071815] N80-11106
DISPLAY DEVICES
Aircrew displays and avionics for application in a future national airspace system
[NASA-TM-80095] N80-11052
Application of modified profile analysis to function testing of simulated CTOL transport touchdown-performance data
[NASA-TP-1541] N80-11069
Avionic system architecture investigation [AVSAR II]
[AD-A071743] N80-11080
In-flight performance evaluation of experimental information
[AD-A071701] N80-11084
Documentation and user's manual for the Visual Detection Simulator [VDS]
[AD-A070487] N80-11107
Time encoded spatial display. Time-compressed display system uses solid-state components and data compression techniques for image processing, storage, and retrieval
[AD-A072128] N80-11301
A comparative 5000 hours life test of light emitting diode displays, including 22 variants from 10 manufacturers
[ECR-86] N80-11370
Processing and display techniques for multispectral satellite imagery
[AD-A072509] N80-11534
Performance, physiological, and oculometer evaluation of VTOL landing displays
[NASA-CR-3171] N80-11771
Integrated helmet-mounted sight/display program: Coating technology
[AD-A072060] N80-11782
Helmet-mounted displays: An experimental investigation of display luminance and contrast
[AD-A072059] N80-11783
Helmet-mounted displays: A computer-assisted analysis of day-night visual requirements
[AD-A072061] N80-11784
The role of the upper field of view in selected HMS/D visual tasks
[AD-A072064] N80-11785
Helmet-mounted sight/display program: Cessna 310 flight test
[AD-A072058] N80-11786
Operational pilot factors analysis report
[AD-A072063] N80-11787
Head aiming/tracking accuracy in a helicopter environment
[AD-A071359] N80-11788
DISTRIBUTION FUNCTIONS
Renewal model of reliability for series systems - revisited
[AD-A072401] N80-11492
On Berry-Esseen rates for statistical functions, with application to L-estimates
[AD-A072131] N80-11854
Space charge limited transport and bunching of non K-V beams
[AD-A072417] N80-11877
DIURNAL VARIATIONS
Parameterization of vertical diffusion in a diurnally varying boundary layer
[DM-27] N80-11706
DIVERGENCE
The response of a turbulent boundary layer to lateral divergence
[IC-AERO-78-03] N80-11394
DIVERGENT NOZZLES
Exhaust flow simulation fo a one cylinder engine with a divergent exhaust pipe
N80-11483
DOCUMENTS
Preparation guide for class B software specification documents
[NASA-CR-162431] N80-11805
Lack of accountability in Government public information and publishing programs
[GPO-45-775] N80-11943
A manual for cataloging and indexing documents — geothermal energy data base
[LBL-4432-REV-1] N80-11946
DOMESTIC ENERGY
Energy initiatives of the 95th Congress
[GPO-42-797] N80-11557
Residential sector energy forecasts, national level for 1978-electricity, natural gas, number two fuel oil and propane
[DOE/EIA-0102/50] N80-11601
DOSIMETERS
Space dosimetry. Volume 2: Technical appendices
[FRT-R646/3-VOL-2] N80-11413
A combined TLD/emulsion method of sampling dosimetry applied to Apollo missions
[NASA-CR-160367] N80-11985
DOUBLE BASE ROCKET PROPELLANTS
Naval sea system command research and exploratory development, 1978 — solid propellant rocket engines and solid rocket propellants
[AD-A071875] N80-11241
DOWNWASH
Prediction of helicopter rotor downwash in hover and vertical flight
[ARL-AERO-REPT-150] N80-11032
DRIFT RATE
Life raft study, February 1978
[AD-A073055] N80-11056
DROP SIZE
Field test of the stabilization of supersized water droplets condensed on pyrotechnically generated hygroscopic nuclei
[AD-A073035] N80-11724
DUCTILITY
Ductility minimum and its reversal with prolonged aging in cobalt-and nickel-base superalloys
[CONF-781202-35] N80-11209
DURABILITY
MNOS boram manufacturing methods and technology project
[AD-A071413] N80-11922
DUST
Studies of dust cake formation and structure in fabric filtration: Second year
[PB-297581/1] N80-11650
DUST STORMS
Observations of atmospheric dust from space
N80-11529
DYE LASERS
Measurement of fluorescence decay times of laser dyes. 1. Behavior of rigid and mobile media with respect to signal extraction and signal propagation. 2
[UCRL-81568] N80-11451
Dye lasers. Citations from the international aerospace abstracts data base
[NTIS/PS-79/0823/9] N80-11460
Dye lasers, volume 2. A bibliography with abstracts
[NTIS/PS-79/0894/0] N80-11465
DYNAMIC CHARACTERISTICS
Micromechanics of intraply hybrid composites: Elastic and thermal properties
[NASA-TM-79253] N80-11143
DYNAMIC MODELS
A dynamical model for the onset of magnetospheric substorms
[AD-A072987] N80-11695
DYNAMIC RESPONSE
A comparison of the pitching and plunging response of an oscillating airfoil
[NASA-CR-3172] N80-11030
Bladed disk dynamic response — for gas turbine rotor blades
[AD-A071975] N80-11091
Dynamic response of damaged angleplied fiber composites
[NASA-TM-79281] N80-11145
Response of a double tube sheet structure to hydraulic pressure transients
[DP-MS-78-73] N80-11519
The dynamic response of solar cells
[CNES-NT-85] N80-11629
DYNAMIC STRUCTURAL ANALYSIS
Structural analysis of a 15,000 tons 'O' press
N80-11484
Higher order tapered beam finite elements for vibration analysis
[ISVR-TR-99] N80-11525
Executive summary: Mod-1 wind turbine generator analysis and design report
[NASA-CR-159497] N80-11558
DYNAMOMETERS
Computer simulation of tire slip on a clayton twin roll dynamometer
[PB-297764/3] N80-11488

E

EARTH (PLANET)
Improved determinations of the earth's gravity field
[AD-A070186] N80-11681
EARTH ATMOSPHERE
Measurements of important minor constituents in the middle atmosphere — microwave radiometer to measure water vapor in the middle atmosphere
[AD-A071845] N80-11679
EARTH CRUST
Earth's crust under the oceans
N80-11528
Approximate methods for the analysis of earth penetration
[SAND-78-1748C] N80-11697
EARTH OBSERVATIONS (FROM SPACE)
Feasibility study for selected Spacelab experiments conducted in the disciplines of earth observation and meteorology
[BMFT-FB-W-77-46] N80-11113
Land cover classification from Landsat data: Phase 3 of a joint DOE/NASA demonstration
[AD-A071723] N80-11535
EARTH RESOURCES
Automated earth resources surveys using satellite and aircraft scanner data: A Finnish approach
[VTT-LU-15] N80-11547
OTEC thermal resource report for Caribbean Sea Plant Ship 13-15 degrees N 75-80 degrees N
[HCP/T2898] N80-11599
Space research in Switzerland, 1978
N80-11995
EARTH RESOURCES INFORMATION SYSTEM
Earth resources data and information service
[GPO-49-530] N80-11530
EARTH SATELLITES
Revised table of earth satellites, volume 2: 1969 to 1973
[RAE-TR-79001] N80-11131
EARTHQUAKE RESISTANT STRUCTURES
Seismic safety margins research program overview
[UCRL-81684] N80-11696
EARTHQUAKES
Synthesis of regional ground motion from western US earthquakes
[AD-A069727] N80-11682
Seismic safety margins research program. Phase 1, project 7: Systems analysis specifications of computational approach
[UCRL-13986-1] N80-11699

ECOLOGY
Trace metals and marine production processes — conference proceedings
[PB-298333/6] N80-11654
ECONOMETRICS
Development of a model of the demand for scientific and technical information services
[PB-297826/0] N80-11948
ECONOMIC ANALYSIS
Multirole cargo aircraft options and configurations — economic analysis
[NASA-TM-80177] N80-11053
Economic of hydrogen production and liquefaction updated to 1980
[NASA-CR-159163] N80-11238
An economic analysis of five selected LANDSAT assisted information systems in Oregon
[NASA-CR-162434] N80-11533
Economics of disposal of lime/limestone scrubbing wastes: Sludge/flyash blending and gypsum systems
[PB-297946/6] N80-11961
ECONOMIC FACTORS
Economics of gasoline production from underground coal gasification via mobil-M process
[CONF-790605-12] N80-11246
Biofuels: A survey
[EPRI-ER-746-SR] N80-11250
Parameter calculation of a screw-pinch reactor with elongated cross-section
[REPT-79-117] N80-11919
ECOSYSTEMS
Physical regionalization of coastal ecosystems of the United States and its territories
[PB-297143/0] N80-11661
EDDY CURRENTS
The equivalent circuit in the mobility analogy of a magnetostrictive transducer in the presence of eddy currents
[AD-A072879] N80-11336
EDUCATION
National environmental/energy workshop assessment, phase 3: Energy programs — directory of courses available
[PB-298587/7] N80-11634
National environmental/energy workforce assessment, phase 3: Solid waste programs — indexes for solid wastes management education
[PB-298586/9] N80-11640
National environmental/energy workforce assessment, phase 3: Pesticides and toxicology programs — post-secondary educational directory
[PB-298582/8] N80-11664
National environmental/energy workforce assessment: Phase 3: Potable water programs — indexes to potable water education programs
[PB-298583/6] N80-11665
National environmental/energy workforce assessment, phase 3: Water/wastewater programs — directory of courses available
[PB-298588/5] N80-11666
National environmental/energy workforce assessment, phase 3: Composite: Environmental engineering/technology
[PB-298589/3] N80-11667
National environmental/energy workforce assessment, phase 3: Composite: Environmental science/health — post-secondary educational directory
[PB-298590/1] N80-11668
National environmental/energy workforce assessment, phase 3: Composite: Environmental studies — indexes to environment management programs
[PB-289591/9] N80-11669
National environmental/energy workforce assessment, phase 3: Air programs — bibliography
[PB-298580/2] N80-11670
National environmental/energy workforce assessment, phase 3: Noise programs — indexes to noise pollution education programs
[PB-298581/0] N80-11671
National environmental/energy workforce assessment, phase 3: Wastewater programs — indexes to waste water education programs
[PB-298584/4] N80-11672
National environmental/energy workforce assessment, phase 3: Radiation programs — indexes on radiation protection education programs
[PB-298585/1] N80-11673
The scope, limits, and training implications of three models of aircraft pilot emergency response behavior
[AD-A071320] N80-11771
Development of unit training and evaluation techniques for combat-ready helicopter pilots. Task 2: Assessment of ARTEP and ATM training objectives and requirements for maintaining operational readiness
[AD-A069224] N80-11776
Development of unit training and evaluation techniques for combat-ready helicopter pilots. Task 1: Development of an instruction program for individual and unit training with combat-ready pilots
[AD-A069242] N80-11777
Microfiche applications in an individualized, self-paced learning system
[AD-A069445] N80-11945
EFFECTIVE PERCEIVED NOISE LEVELS
Intersimulus interval as it affects temporary threshold shift in serial presentations of loud tones
[AD-A072006] N80-11762
EFFLUENTS
Removal of lagoon effluent suspended solids by a slow-rock filter
[PB-297454/1] N80-11957
EGGS
Environmental studies of the south Texas outer continental shelf, 1977. Ichthyoplankton/Mackerel Eggs and larvae
[PB-296647/1] N80-11753
EIGENVALUES
Pseudosymmetric eigenmode expansion for the magnetic field integral equation and SEM consequences
[AD-A071429] N80-11297
A summary of spectral synthesis procedures for multivariable systems
[NASA-CR-162436] N80-11862
EIGENVECTORS
A summary of spectral synthesis procedures for multivariable systems
[NASA-CR-162436] N80-11862
EJECTION INJURIES
Exploratory development of aircrew windblast protection concepts
[AD-A072013] N80-11055
EJECTION SEATS
Ejection seat for high G escape
[AD-A072444] N80-11054
Exploratory development of aircrew windblast protection concepts
[AD-A072013] N80-11055
EJECTORS
Evaluation of an ejector powered engine simulator at transonic Mach numbers
[AD-A071607] N80-11094
ELASTIC BUCKLING
Large deformation elastic-plastic buckling analysis of spherical caps with initial imperfections
[AD-A071480] N80-11509
ELASTIC DEFORMATION
MDSFP: A computer program for elastic solution of three dimensional structures by the finite element method [LWBR development program]
[WAPD-TM-1187] N80-11816
ELASTIC PLATES
Force and moment impedance of infinite plates
[D3-1978] N80-11526
Study by elastic theory of the clustering of solute atoms during the early stage of solid solution decomposition — using strain energy method martensite
[LBL-7680] N80-11880
ELASTIC PROPERTIES
Micromechanics of intraply hybrid composites: Elastic and thermal properties
[NASA-TM-79253] N80-11143
Influence of multiaxial stress states, stress gradients and elastic anisotropy on the evaluation of residual stresses by X-rays
[AD-A067909] N80-11190
ELASTIC WAVES
Force and moment impedance of infinite plates
[D3-1978] N80-11526
ELASTODYNAMICS
Study by elastic theory of the clustering of solute atoms during the early stage of solid solution decomposition — using strain energy method martensite
[LBL-7680] N80-11880
ELASTOHYDRODYNAMICS
Determination of physical and chemical states of lubricants in concentrated contacts, part 1
[NASA-CR-3204] N80-11225
ELASTOPLASTICITY
Large deformation elastic-plastic buckling analysis of spherical caps with initial imperfections
[AD-A071480] N80-11509
Elastic-plastic-creep analysis of shells
[CONF-790402-16] N80-11517
ELECTRIC BATTERIES
Regenerative flywheel energy storage system
[UCRL-13982] N80-11594
ELECTRIC CONNECTORS
Laser welding of electrical interconnections
[BDX-613-2022-REV] N80-11356
ELECTRIC CURRENT
Formulation of electromagnetic pulse external interaction above a lossy earth
[AD-A071327] N80-11298
Electric current controlled liquid phase epitaxy of compound semiconductors for microwave devices — indium phosphides
[AD-A072643] N80-11923
ELECTRIC DISCHARGES
Optical and discharge studies of novel electronic transition laser species
[AD-A071853] N80-11439
ELECTRIC FIELDS
Small conductive particle sensor
[NASA-CASE-LAR-12552-1] N80-11400
Effects of longitudinal electric self-field on the acceptable energy spread in a free electron laser
[UCID-17985] N80-11452
Studies of dust cake formation and structure in fabric filtration: Second year
[PB-297581/1] N80-11650
Non-neutral field-aligned current sheet and auroral electric field
[AD-A072852] N80-11687
ELECTRIC GENERATORS
Night storage and backup generation with electrochemical engines — study of electric generators for electrochemical engines using photovoltaic energy conversion
[LA-UR-78-1149] N80-11596
ELECTRIC HYBRID VEHICLES
A survey of electric and hybrid vehicle simulation programs
[NASA-CR-162457] N80-11954
ELECTRIC MOTOR VEHICLES
A survey of electric and hybrid vehicle simulation programs
[NASA-CR-162457] N80-11954
Near-term electric vehicle program: Phase 2: Mid-term summary report
[SAN-1213-02] N80-11956
ELECTRIC MOTORS
Hydrogen-electric power drives
[SLAC-PUB-2203] N80-11604
Magnetic propulsion railguns: Their design and capabilities
[UCRL-82677] N80-11866
ELECTRIC NETWORKS
On the magnetizing energy balance in electric networks, particularly regarding networks involving machines with commutators
[REPT-1630] N80-11365
ELECTRIC POWER
Blackouts and brownouts and their effect on computer operations
[BNL-24960] N80-11798
ELECTRIC POWER SUPPLIES
Demand management demonstration project. Stage 1: Development of residential load characteristics. Stage 4: Demonstration of residential incremental cost pricing implemented by time-of-day metering
[HCP/B8072-01] N80-11941
ELECTRIC PROPULSION
Cost-effective technology advancement directions for electric propulsion transportation systems in earth-orbital missions
[NASA-TM-79289] N80-11950
ELECTRIC TERMINALS
Laser welding of electrical interconnections
[BDX-613-2022-REV] N80-11356
ELECTRICAL FAULTS
Automated monitoring of thin film capacitors for electrical breakdown
[BDX-613-2076-REV] N80-11359
ELECTRICAL INSULATION
Electrical properties of solid insulators as a function of temperature and pressure — submarine telephone cables
[PUBL-364] N80-11364
ELECTRICAL PROPERTIES
The influence of contact and interface effects of the electronic properties and stability of chemically unstable materials
[AD-A073073] N80-11243
Electrical properties of solid insulators as a function of temperature and pressure — submarine telephone cables
[PUBL-364] N80-11364
Characterization of solar cells for space applications. Volume 10: Electrical characteristics of Spectrolab BSF, textured, 10 ohm-cm, 300 micron cells as a function of intensity, temperature and irradiation
[NASA-CR-162422] N80-11566
The effect of crystal growth direction on the energy resolution of high-purity germanium detectors — radiation detectors
[LBL-8133] N80-11928
ELECTRICAL RESISTANCE
Electrical compensation system for plated-through-hole tester: Milestone Report
[BDX-613-1943-REV] N80-11354
ELECTRICITY
The Building Loads Analysis and System Thermodynamics [BLAST] program, version 2.0. Users manual, volume 1
[AD-A072272] N80-11258
United States/Canada electricity exchanges
[DOE/ERA-0053] N80-11583
ELECTRO-OPTICS
Special session on streak camera dynamic range measurement definition
[UCRL-81704] N80-11408
Radiation effects in optical emitters and receivers
[SAND-78-1798] N80-11899
Fresnel zone correction plates for the electron microscope
[UCRL-TRANS-11440] N80-11900
ELECTROCATALYSTS
Platinum-substitute materials as electrocatalysts for oxygen reduction
[PB-297261/0] N80-11186
ELECTROCHEMICAL CORROSION
Analysis of the influence of space conditions upon reactions between liquid as well as gaseous corrosive agents and metals
[BMFT-FB-W-77-10] N80-11222
ELECTROCHEMICAL MACHINING
Laser cutting and machining: Nonmetals. Citations from the Engineering Index data base — bibliography with abstracts
[NTIS/PS-79/0891/6] N80-11464

ELECTROCHEMISTRY
Similarities and differences between electron and proton transfers at electrodes and in solution
[AD-A073001] N80-11162
Platinum-substitute materials as electrocatalysts for oxygen reduction
[PB-297261/0] N80-11186
Electrochemical deburring: Another sharp sword in the battle with burrs
[BDX-613-2132] N80-11262
Lithium-thionyl chloride battery
[AD-A072358] N80-11568
Night storage and backup generation with electrochemical engines --- study of electric generators for electrochemical engines using photovoltaic energy conversion
[LA-UR-78-1149] N80-11596
Indirect microbial detection
[NASA-CASE-LAR-12520-1] N80-11756
ELECTRODEPOSITION
Ellipsometry of anodic film growth
[LBL-8082] N80-11927
ELECTRODES
Influence of electrolyte composition on electrode kinetics in the molten carbonate fuel cell
[CONF-781063-2] N80-11615
Relaxation of Z discharge between electrodes --- using Taylor series to find final relaxation of zeta pinch magnetohydrodynamic stability
[IPPJ-414] N80-11903
ELECTRODYNAMICS
A case study of S3-2 observations in the late evening auroral oval
[AD-A072996] N80-11692
ELECTROFORMING
Effects of impurities on the weldability of electroformed nickel
[NASA-CR-162455] N80-11214
ELECTROLYTES
Analysis of the influence of space conditions upon reactions between liquid as well as gaseous corrosive agents and metals
[BMFT-FB-W-77-10] N80-11222
Influence of electrolyte composition on electrode kinetics in the molten carbonate fuel cell
[CONF-781063-2] N80-11615
ELECTROLYTIC CELLS
Study of metal-oxygen solid solutions utilizing solid electrolytic cells
[COO-1198-1216] N80-11210
ELECTROMAGNETIC ABSORPTION
Aeronautical sounding rocket program. Results of ground-based short wave absorption measurements performed at 38 deg northern latitude between 1967 and 1976
[BMFT-FB-W-78-22] N80-11704
ELECTROMAGNETIC INTERACTIONS
High explosive detonation and electromagnetic interaction
[AD-A072577] N80-11285
ELECTROMAGNETIC INTERFERENCE
An experimental investigation of the reduction of nonlinear effects using passive compensating networks
[AD-A072422] N80-11284
ELECTROMAGNETIC NOISE
Raster-scan display photometric noise measurement
[AD-A073024] N80-11308
ELECTROMAGNETIC PROPULSION
Magnetic propulsion railguns: Their design and capabilities
[UCRL-82677] N80-11866
ELECTROMAGNETIC PULSES
An investigation of portable electromagnetic pulse simulators/alternate simulators
[AD-A071342] N80-11292
Formulation of electromagnetic pulse external interaction above a lossy earth
[AD-A071327] N80-11298
ELECTROMAGNETIC RADIATION
Electromagnetic boundary-valve problems based upon a modification of residue calculus and function theoretic techniques
[PB-297305/5] N80-11867
ELECTROMAGNETIC SHIELDING
An investigation of portable electromagnetic pulse simulators/alternate simulators
[AD-A071342] N80-11292
ELECTROMAGNETIC SPECTRA
Prospects and limitations for use of frequency spectrum from 40 to 300 GHz
[NASA-TM-80812] N80-11272
ELECTROMAGNETIC SURFACE WAVES
Resonance and cut-off surfaces in the ion cyclotron frequency range in toroidal geometry
[TRITA-PFU-79-04] N80-11916
ELECTROMECHANICAL DEVICES
Hobbing ratchet wheels for miniature mechanisms
[BDX-613-1927-REV] N80-11476
ELECTRON ACCELERATORS
Radial electron beam laser excitation: The REBLE report
[SAND-78-2005] N80-11450
ELECTRON BEAMS
The influence of contact and interface effects of the electronic properties and stability of chemically unstable materials
[AD-A073073] N80-11243
Electric and magnetic fields of an intense pulse of relativistic electrons propagating through air
[AD-A071621] N80-11332
Electron-beam braze welding of beryllium
[Y-2138] N80-11477
ELECTRON CAPTURE
Single-electron capture into Ar + excited states in ar + Na collision below 12 keV. 2: Relative population distributed in Ar + excited states
[IPPJ-411] N80-11876
ELECTRON DENSITY [CONCENTRATION]
Rigorous derivation of general dispersion relationship for gyrotron
[AD-A072005] N80-11438
ELECTRON DENSITY PROFILES
Measurements of electron density and temperature profiles in a gas blanket experiment
[TRITA-PFU-79-03] N80-11915
ELECTRON IRRADIATION
Electron radiation damage of [AlGa] As-GaAs solar cells
[NASA-CR-162425] N80-11564
ELECTRON MICROSCOPES
Fresnel zone correction plates for the electron microscope
[UCRL-TRANS-11440] N80-11900
ELECTRON PLASMA
The oscillating two stream and parametric decay instabilities in a weakly magnetized plasma
[AD-A072396] N80-11907
ELECTRON SCATTERING
Tests of strong, electromagnetic interactions and weak interactions with positron electron collisons
[PM/79/8] N80-11886
ELECTRON TRANSFER
Similarities and differences between electron and proton transfers at electrodes and in solution
[AD-A073001] N80-11162
ELECTRON TUBES
I/J band low-cost crossed-field amplifier
[AD-A072311] N80-11330
High average power broadband electron-bombarded semiconductor EBS amplifier
[AD-A072533] N80-11331
ELECTRONIC COUNTERMEASURES
Distributed source generation for RF environmental modeling for hardware-in-the-loop missile guidance simulation
[AD-A072927] N80-11126
ELECTRONIC EQUIPMENT
Design of safe electrical equipment for research
[LA-7597-MS] N80-11346
ELECTRONIC EQUIPMENT TESTS
Reliability of packaged beam-lead transistors built with different pre-seal assembly techniques
[BDX-613-1952-REV] N80-11349
Electrical compensation system for plated-through-hole tester: Milestone Report
[BDX-613-1943-REV] N80-11354
On the use of a semi-automated test system for measuring the characteristics and/or the 'S' parameters of a quadrupolar network
[CNES-NT-87] N80-11363
Airborne oil spill surveillance systems in Sweden
[FP1-9] N80-11646
ELECTRONIC MODULES
Modular digital missile guidance
[AD-A072544] N80-11125
ELECTRONIC PACKAGING
Rectangular flat-pack lids under external pressure improved formulas for screening and design, revised
[AD-A072421] N80-11329
ELECTROPHOTOMETRY
Photometric properties of G, K and M stars in relation to galatic structure and evolution
[PUBL-SER-B-FASC-5] N80-11969
ELECTROPLATING
The deposition of gold - copper - cadmium alloys
[DRIC-TRANS-5465] N80-11218
Metal hydroxides from electroplating sludge characterization and metal recovery
[AD-A070233] N80-11636
ELECTROSTATIC CHARGE
Use of glow discharge in fluidized beds
[NASA-CASE-ARC-11245-1] N80-11326
Static elimination work stations --- to protect semiconductor devices
[BDX-613-1953-REV] N80-11355
ELECTROSTATIC WAVES
On the existence and stability of trapped Langmuir modes in a double layer
[UPTEC-78-89-R] N80-11918
ELEMENTARY PARTICLES
Theoretical and high energy physics
[COO-1764-342] N80-11912
ELEVATION ANGLE
Analysis of tropospheric effects at low elevation angles
[AD-A073089] N80-11691
ELEVONS
Design and fabrication of elevon cove thermal protection systems for aerospace vehicles
[NASA-CR-159055] N80-11134
ELLIPSOMETERS
Elipsometry of surface layers on lead and lithium
[LBL-8375] N80-11926
Ellipsometry of anodic film growth
[LBL-8082] N80-11927
ELLIPTIC DIFFERENTIAL EQUATIONS
On the regularity and approximation of the solutions of some optimal control problems governed by elliptic equations
[CSIR-TWISK-47] N80-11842
EMERGENCIES
The scope, limits, and training implications of three models of aircraft pilot emergency response behavior
[AD-A071320] N80-11773
Development of an emergency response program for transportation of hazardous waste
[PB-297438/4] N80-11962
EMISSION
Inductively coupled plasma-atomic emission spectroscopy: An evaluation of the use of nitrogen-argon admixtures as plasma discharge atmospheres
N80-11177
EMISSION SPECTRA
An emission-line survey of the Milky Way
[NASA-SP-434] N80-11966
EMITTANCE
Radiation effects in optical emitters and receivers
[SAND-78-1798] N80-11899
ENERGETIC PARTICLES
Solar-geophysical data number 417. Part 2: Data for November 1978 - October 1978 and miscellanea
[PB-297448/3] N80-11984
ENERGY CONSERVATION
On the magnetizing energy balance in electric networks, particularly regarding networks involving machines with commutators
[REPT-1630] N80-11365
Energy initiatives of the 95th Congress
[GPO-42-797] N80-11557
An evaluation of the NASA Tech House, including live-in test results, volume 1
[NASA-TP-1564] N80-11559
Transfer of energy conservation technology to industry. A preliminary survey of existing mechanisms
[ANL/EES-TM-28] N80-11576
Implementing energy conservation strategies in energy materials transport: U. S. Department of Energy and other government agency policy-making decisions
[ANL/EES-TM-32] N80-11577
Standby conservation plan no. 2: Emergency building temperature restrictions. Economic analysis
[DOE/ERA-0047] N80-11593
Analysis of financial programs for energy conservation: Market simulation [penetration] model
[HCP/M8662-1] N80-11606
Energy conservation: Policy issues and end-use scenarios of savings potential. Part 3: Policy barriers and investment decisions in industry
[LBL-7896-PT-3] N80-11614
National environmental/energy workshop assessment, phase 3. Energy programs --- directory of courses available
[PB-298587/7] N80-11634
ENERGY CONSUMPTION
The Building Loads Analysis and System Thermodynamics [BLAST] program, version 2.0. Users manual, volume 1
[AD-A072272] N80-11258
The Building Loads Analysis System Thermodynamics [BLAST] program version 2.0 Input booklet --- for predicting energy consumption based on structural size and meteorological data
[AD-A072435] N80-11259
Residential sector energy forecasts, national level for 1978-electricity, natural gas, number two fuel oil and propane
[DOE/EIA-0102/50] N80-11601
Demand management demonstration project. Stage 1: Development of residential load characteristics. Stage 4: Demonstration of residential incremental cost pricing implemented by time-of-day metering
[HCP/B8072-01] N80-11941
ENERGY CONVERSION
Heat pump centered integrated community energy systems: Systems development, Dubin-Bloome Associates
[ANL/ICES-TM-29] N80-11572
Wind energy systems: Program summary
[DOE/ET-0093] N80-11578
Conversion of radiant energy into chemical energy
[UCRL-TRANS-11427] N80-11609
ENERGY CONVERSION EFFICIENCY
Silicon solar cell process development, fabrication and analysis, phase 1
[NASA-CR-162427] N80-11561
Interaction in limited arrays of windmills: Review of earlier results from a simple model and a presentation of the capabilities of a dynamic PBL model
[DM-26] N80-11631
ENERGY DISSIPATION
On the behaviour of heliostats in the extreme winter climate of the Swiss Mountains
[AED-CONF-78-212-001] N80-11611
ENERGY DISTRIBUTION
Effects of longitudinal electric self-field on the acceptable energy spread in a free electron laser
[UCID-17985] N80-11452
ENERGY LEVELS
Collective states and crossing symmetry
[CSIR-TWISK-58] N80-11840

ENERGY POLICY
Chemical structures and reactivities of coal as an organic natural product
[CONF-790415-25] N80-11168
Combustion of low grade coal
[ICTIS/TR-02] N80-11179
Economics of gasoline production from underground coal gasification via mobil-M process
[CONF-790405-12] N80-11246
Biofuels: A survey
[EPRI-ER-746-SR] N80-11250
National Gas Survey report to the Federal Energy Regulatory Commission by the Supply-Technical Advisory Task Force on nonconventional natural gas resources
[DOE/FERC-0010] N80-11251
Unconventional circuits for static voltage transformers
[BMFT-FB-T-78-26] N80-11368
Tertiary oil recovery processes research at the University of Texas
[BETC-0001-1] N80-11544
MEDEE 2: A model for long term energy demand evaluation
[IIASA-RR-78-17] N80-11554
Solar commercialization
[GPO-43-586] N80-11556
Energy initiatives of the 95th Congress
[GPO-42-797] N80-11557
Heat pump centered integrated community energy systems: System development
[ANL/ICES-TM-27] N80-11571
Heat pump centered integrated community energy systems; System development
[ANL-ICES-TM-28] N80-11574
Implementing energy conservation strategies in energy materials transport: U. S. Department of Energy and other government agency policy-making decisions
[ANL/EES-TM-32] N80-11577
Wind energy systems: Program summary
[DOE/ET-0093] N80-11578
Geothermal energy for industrial application
[LBL-8919] N80-11579
Concentrating solar collector test results Collector Module Test Facility [CMTF]
[SAND-78-0977] N80-11580
Heat loss reduction techniques for annular solar receiver designs
[SAND-78-1769] N80-11581
Design considerations for a proposed passive vacuum solar annular receiver
[SAND-78-0982] N80-11582
Regional reference energy systems: Electric utility applications
[BNL-50962] N80-11585
DOE heat pump centered integrated community energy systems project
[CONF-790362-1] N80-11586
Department of Energy fossil energy equipment development programs
[CONF-790405-14] N80-11590
Standby conservation plan no. 2: Emergency building temperature restrictions. Economic analysis
[DOE/ERA-0047] N80-11593
Residential sector energy forecasts, national level for 1978-electricity, natural gas, number two fuel oil and propane
[DOE/EIA-0102/50] N80-11601
Status of information for consumers of small wind energy systems
[SERI/TP-51-158] N80-11602
Analysis of financial programs for energy conservation: Market simulation [penetration] model
[HCP/M8662-1] N80-11606
Energy conservation: Policy issues and end-use scenarios of savings potential. Part 3: Policy barriers and investment decisions in industry
[LBL-7896-PT-3] N80-11614
Research overview of biological and chemical conversion methods and identification of key research areas for SERI
[SERI/TR-33-067] N80-11617
International coal technology summary document
[DOE/PE-0010] N80-11621
Investigation of the applicability of technical systems utilizing solar energy for the heat supply of buildings
[BMFT-FB-T-78-48] N80-11630
Interaction in limited arrays of windmills: Review of earlier results from a simple model and a presentation of the capabilities of a dynamic PBL model
[DM-26] N80-11631
Solar energy with latent heat storage: Fundamentals and applications
[ASSA-10/1978] N80-11632
Solar access law. Protecting access to sunlight for solar energy systems
[PB-296532/5] N80-11633
National environmental/energy workforce assessment, phase 3. Air programs — bibliography
[PB-298580/2] N80-11670
Evaluation of nuclear power plant siting by probabilistic assessment of environmental impact
[VTT-EN-24] N80-11891

ENERGY REQUIREMENTS
MEDEE 2: A model for long term energy demand evaluation
[IIASA-RR-78-17] N80-11554
Energy initiatives of the 95th Congress
[GPO-42-797] N80-11557
Disaggregating PIES fuel forecasts, validating PIES transportation model data base, and other technical services
[TID-29000] N80-11612

ENERGY SOURCES
Increased energy from biomass: 1985 possibilities and problem. Working papers for planners
[RLO-788-5] N80-11589
Chemical engineering division basic energy sciences research
[ANL-78-42] N80-11610
Ocean systems, program summary
[DOE/ET-0083] N80-11751

ENERGY SPECTRA
Calculated linear energy transfer spectra of HZE particles for the free flyer Biostack experiment on the LDEF-mission
N80-11767

ENERGY STORAGE
Design considerations for a proposed passive vacuum solar annular receiver
[SAND-78-0982] N80-11582
Regenerative flywheel energy storage system
[UCRL-13982] N80-11594
Materials program for fiber composite flywheels
[UCRL-81724] N80-11618
Lateral and tilt whirl modes of flexibly mounted flywheel systems — for energy storage
[SAND-78-7070] N80-11622
Underground pumped hydro storage: An overview
[CONF-781046-1] N80-11624
Evaluation of turbomachinery for compressed air energy storage plants
[CONF-781046-6] N80-11625
Design optimization of aquifer reservoir-based compressed air storage systems
[CONF-781046-5] N80-11628

ENERGY TECHNOLOGY
National Gas Survey report to the Federal Energy Regulatory Commission by the Supply-Technical Advisory Task Force on nonconventional natural gas resources
[DOE/FERC-0010] N80-11251
The automated array assembly task of the low-cost silicon solar array project, phase 2
[NASA-CR-162429] N80-11562
Heat pump centered integrated community energy systems: System development
[ANL/ICES-TM-27] N80-11571
Heat pump centered integrated community energy systems; System development
[ANL-ICES-TM-28] N80-11574
Wind energy systems: Program summary
[DOE/ET-0093] N80-11578
Regional reference energy systems: Electric utility applications
[BNL-50962] N80-11585
DOE heat pump centered integrated community energy systems project
[CONF-790362-1] N80-11586
World Energy Data System [WENDS]
[CONF-790461-2] N80-11587
Regenerative flywheel energy storage system
[UCRL-13982] N80-11594
OTEC thermal resource report for Caribbean Sea Plant Ship 13-15 degrees N 75-80 degrees N
[HCP/T2898] N80-11599
Energy storage for solar air conditioning applications utilizing a form-stable, high density polyethylene pellet bed
[MLM-2598[OP]] N80-11603
Hydrogen-electric power drives
[SLAC-PUB-2203] N80-11604
International coal technology summary document
[DOE/PE-0010] N80-11621
Underground pumped hydro storage: An overview
[CONF-781046-1] N80-11624
National environmental/energy workshop assessment, phase 3. Energy programs — directory of courses available
[PB-298587/7] N80-11634
Energy development vs water quality in the upper Colorado and upper Missouri River Basins
[LA-7497-MS] N80-11641
Report on Finnish technological activities
N80-11991

ENERGY TRANSFER
Scientific objective 3: Radiative models
N80-11418
Heat pump centered integrated community energy systems: Systems development, Dubin-Bloome Associates
[ANL/ICES-TM-29] N80-11572
Calculated linear energy transfer spectra of HZE particles for the free flyer Biostack experiment on the LDEF-mission
N80-11767
High temperature gas energy transfer
[AD-A072727] N80-11884
Is the sun constant?
[ATR-79[9552]-4] N80-11981

ENGINE DESIGN
Soviet Aeronautics, volume 21, no. 2 — aerodynamics of aircraft structures and engine design
N80-11002
Statistical diagnostics aircraft engines
N80-11006
Optimal thermogasdynamic design of gas turbine engines using element prototypes, 1
N80-11007
On the development of The RB 199
[DRIC-TRANS-5429] N80-11096
Fundamental characterization of alternate fuel effects in continuous combustion systems
[SAN-1543-12] N80-11244
Night storage and backup generation with electrochemical engines — study of electric generators for electrochemical engines using photovoltaic energy conversion
[LA-UR-78-1149] N80-11596

ENGINE TESTS
Simulated Mission Endurance Test [SMET] for an aircraft engine to be used in a fighter/attack role
[AD-A071907] N80-11089

ENGINEERING DRAWINGS
Design of a tunable high-Q superconducting notch filter
[ANL-78-91] N80-11358

ENGLAND
New aircraft technology: Report on the Farnborough International Air Show
[PB-298345/0] N80-11078

ENTHALPY
Experimental enthalpies for a mixture of 80 mole percent isobutane in isopentane
[EPRI-ER-1034] N80-11935

ENTROPY
Entropy analysis of feedback flight dynamic control systems
[AD-A072259] N80-11100

ENVIRONMENT EFFECTS
Two-dimensional transient dispersion and adsorption in porous media
[UCRL-81970] N80-11386
INEL geothermal environmental program
[TREE-1340] N80-11595
Biological evaluation of devices used for entrainment and impingement losses at thermal power plants
[CONF-7809109-1] N80-11597
Trace metals and marine production processes — conference proceedings
[PB-298333/6] N80-11654
Evaluation of nuclear power plant siting by probabilistic assessment of environmental impact
[VTT-EN-24] N80-11891

ENVIRONMENT MANAGEMENT
Meteorology and the human environment
[WMO-577] N80-11643
National environmental/energy workforce assessment, phase 3. Composite: Environmental studies — indexes to environment management programs
[PB-289591/9] N80-11669

ENVIRONMENT PROTECTION
Biological evaluation of devices used for entrainment and impingement losses at thermal power plants
[CONF-7809109-1] N80-11597
Chemical engineering division basic energy sciences research
[ANL-78-42] N80-11610
National environmental/energy workshop assessment, phase 3. Energy programs — directory of courses available
[PB-298587/7] N80-11634
National environmental/energy workforce assessment, phase 3. Water/wastewater programs — directory of courses available
[PB-298588/5] N80-11666
National environmental/energy workforce assessment, phase 3. Composite: Environmental science/health — post-secondary educational directory
[PB-298590/1] N80-11668

ENVIRONMENT SIMULATION
Influence of environmental cycling on the mechanical properties of composite materials, part 2
[FFA-TN-HU-1853:1-PT-2] N80-11155

ENVIRONMENTAL CONTROL
Environmental control technology for carbon dioxide
[BNL-24999] N80-11639

ENVIRONMENTAL ENGINEERING
National environmental/energy workforce assessment, phase 3. Composite: Environmental engineering/technology
[PB-298589/3] N80-11667
National environmental/energy workforce assessment, phase 3. Composite: Environmental science/health — post-secondary educational directory
[PB-298590/1] N80-11668

ENVIRONMENTAL MONITORING
Environmental studies of the south Texas outer continental shelf, 1977. Ichthyoplankton/Mackerel Eggs and larvae
[PB-296647/1] N80-11753
Environmental studies of the south Texas continental shelf. Snapper/Grouper
[PB-296645/5] N80-11755

ENVIRONMENTAL QUALITY
Report of activities on world meteorological research, applications and water resources development
[WMO-529] N80-11733

ENVIRONMENTAL TESTS
Materiel testing in the tropics
[AD-A072434] N80-11489

ENVIRONMENTS
National environmental/energy workforce assessment, phase 3. Air programs — bibliography
[PB-298580/2] N80-11670
EPITAXY
Electric current controlled liquid phase epitaxy of compound semiconductors for microwave devices — indium phosphides
[AD-A072643] N80-11923
EPOXY COMPOUNDS
Shelf life determination of epoxy prepregs and film adhesives
[BDX-613-2033-REV] N80-11233
Characteristics of laser cutting Kevlar laminates
[BDX-613-2075-REV] N80-11456
EPOXY RESINS
Tensile and flexural strength of non-graphitic super-hybrid composites: Predictions and comparisons
[NASA-TM-79276] N80-11144
Analytical and experimental evaluation of two designs for a graphite/epoxy antenna feed truss for a communications satellite
[AD-A072484] N80-11151
Performance of a gel permeation chromatograph and its usefulness in examining mixtures of organic materials — epoxy resin aircraft adhesives
[MRL-R-725] N80-11158
Materials program for fiber composite flywheels
[UCRL-81724] N80-11618
EQUATIONS OF STATE
Functional sensitivity for ordinary differential equations
[CSIR-TWISK-65] N80-11837
Construction of the equation of state for chemical compounds
[UCRL-TRANS-11474] N80-11937
EQUATORS
Study of the equatorward edge of the auroral oval from satellite observations
[AD-A072997] N80-11693
EQUILIBRIUM EQUATIONS
On the limit state of a toroidal shell of revolution under axisymmetric deformation
N80-11015
EQUILIBRIUM FLOW
Harmonic oscillations of annular wing in steady ideal fluid flow
N80-11019
EQUIPMENT
Department of Energy fossil energy equipment development programs
[CONF-790405-14] N80-11590
EQUIPMENT SPECIFICATIONS
Categorization and specification requirements for a common family of AUTODIN terminals
[AD-A072164] N80-11287
Reliability of packaged beam-lead transistors built with different pre-seal assembly techniques
[BDX-613-1952-REV] N80-11349
EQUIVALENT CIRCUITS
The equivalent circuit in the mobility analogy of a magnetostrictive transducer in the presence of eddy currents
[AD-A072879] N80-11336
EROSION
Assessment of the state of knowledge pertaining to solid particle erosion
[AD-A073034] N80-11199
ERROR ANALYSIS
Some methods for identification of linear systems with noisy input/output data
[UPTEC-78-73-R] N80-11315
ERROR CORRECTING DEVICES
Improvements in apparatus for pH measurement of water
[TDB-320] N80-11412
ERROR FUNCTIONS
A fault tolerance assessment of dais — failure analysis in digital information systems using error functions
[AD-A072450] N80-11082
ESA SATELLITES
Space research in Belgium, 1978
N80-11997
ESCAPE SYSTEMS
Ejection seat for high G escape
[AD-A072444] N80-11054
ESTIMATORS
On-line structural response analysis: Using the extended Kalman estimator/identifier
[UCID-18175] N80-11516
ETCHING
Etching study for the MC2980 glass ceramic preform
[SAND-78-1295] N80-11235
EULER EQUATIONS OF MOTION
Unitarity restrictions on semi-classical approximations to certain functional integrals
[COO-313TA-343] N80-11852
EUROPE
Propagation of Lg waves across eastern Europe and Asia
[UCRL-52494] N80-11312
EUROPEAN SPACE PROGRAMS
Swedish space activities during 1978
N80-11117
EVALUATION
On software reliability modeling
[AD-A072420] N80-11807
EVAPOTRANSPIRATION
The calculation of evapotranspiration using the Penman formula
[KNMI-WR-79-3] N80-11736
EVOLUTION [DEVELOPMENT]
Comets: Cosmic connections with carbonaceous meteorites, interstellar molecules and the origin of life
N80-11975
EXCITATION
Advanced laser concepts. Addendum: Production of excited states
[AD-A071393] N80-11436
LASL program in nuclear pumped liquid lasers
[LA-UR-78-3016] N80-11446
Nuclear pumped electronic transition laser studies
[LA-UR-78-3015] N80-11447
Fluorescence diagnostics in two-step laser excitation of high Z atoms
[UCRL-81746] N80-11449
EXHAUST EMISSION
Argon/UF6 plasma exhaust gas reconstitution experiments using preheated fluorine and on-line diagnostics — fusioning uranium plasma core reactor design
[NASA-CR-159158] N80-11906
EXHAUST FLOW SIMULATION
Exhaust flow simulation fo a one cylinder engine with a divergent exhaust pipe
N80-11483
EXHAUST GASES
Summary report on motor vehicle emissions inspection and maintenance programs for non-attainment areas in Louisiana
[PB-294979/0] N80-11648
EXHAUST NOZZLES
Fuselage and nozzle pressure distributions on a 1/12-scale F-15 propulsion model at transonic speeds — conducted in langley 16 foot transonic tunnel
[NASA-TP-1521] N80-11036
Studies of the acoustic transmission characteristics of coaxial nozzles with inverted velocity profiles, volume 1 — jet engine noise radiation through coaxial exhaust nozzles
[NASA-CR-159699] N80-11870
EXHAUST SYSTEMS
A comparison of five methods for calculating the exhaust flow from internal combustion engines
N80-11482
EXOTHERMIC REACTIONS
Single-electron capture into Ar + excited states in ar + Na collision below 12 keV. 2: Relative population distributed in Ar + excited states
[IPPJ-411] N80-11876
EXPERIMENTAL DESIGN
Mach 130 air shock attenuation studies — outlet pipes
[UCRL-82012] N80-11043
Feasibility study for selected Spacelab experiments conducted in the disciplines of earth observation and meteorology
[BMFT-FB-W-77-46] N80-11113
Design and operation of the search-coil magnetometer experiment on the solar probe HELIOS
[BMFT-FB-W-77-25] N80-11129
Pallet-only configuration improvement study. Technical summary report
[RAE-TP-7717] N80-11132
Description of experimental techniques used in heat capacity measurements of adsorbed helium
[UPTEC-78-18-R] N80-11206
The relationship between distortion and image quality: Sampling procedures and accuracy
[FUB-51-1977] N80-11317
The rhymed words method of measuring the intelligibility index in audiometric work. The influence of open and closed vowels
[FUB-1-1979] N80-11324
Candidate shuttle lidar experiments
N80-11423
Appendix A: Descriptions of shuttle borne lidar experiments
N80-11425
Ten point six micron laser target designator
[AD-A071912] N80-11429
Tread-free block designs: Existence and construction results
[AD-A072136] N80-11863
Development and evaluation of an experimental parametric acoustic receiving array [PARRAY]
[AD-A072307] N80-11873
EXPLORATION
Geothermal exploration methods and results: Inland states
[LA-UR-79-665] N80-11543
EXPLOSIVE DEVICES
Detonation of explosives using semiconducting layers
[PUBL-368] N80-11252
EXPLOSIVE FORMING
Explosive forming of butt welded pipe reducers
[AD-A072430] N80-11475
EXPLOSIVES
The influence of contact and interface effects of the electronic properties and stability of chemically unstable materials
[AD-A073073] N80-11243
Behavior of lightly confined high explosives in a jet-fuel fire
[UCRL-52659] N80-11247
Survey of the activities concerning sensitivity test methods for explosives
[PML-1979-20] N80-11253
Explosive technique for asymmetric expansion of cylinders at high strain rates
[SAND-78-2393] N80-11261
High explosive detonation and electromagnetic interaction
[AD-A072577] N80-11285
EXTENSOMETERS
Design of a high precision dilatometer using laser interferometry
[SAND-78-1796] N80-11407
EXTRATERRESTRIAL RADIATION
Comparison of extraterrestrial and earth-based solar spectral irradiance results
[CSIR-RR-342] N80-11980
EXTRUDING
A phenomenological mechanism for the occurrence of the extrusion central burst defect
[AD-A072476] N80-11197

F

F-4 AIRCRAFT
F-4 radar altimeter aural warning
[AD-A072870] N80-11085
F-106 AIRCRAFT
Development of improved abradable compressor gas path seal
[AD-A072171] N80-11474
FABRICATION
Development and fabrication of bismaleimide-graphite composites
[NASA-CR-152324] N80-11141
Silicon solar cell process development, fabrication and analysis, phase 1
[NASA-CR-162427] N80-11561
Solar parabolic trough forming process
[ALO-4158-1] N80-11626
FAILURE
Proceedings of the 28th Meeting of the Mechanical prevention group, Report on MFPG detection, diagnosis, and prognosis
[NASA-TM-80861] N80-11502
FAILURE ANALYSIS
A fault tolerance assessment of dais — failure analysis in digital information systems using error functions
[AD-A072450] N80-11082
A comparative 5000 hours life test of light emitting diode displays, including 22 variants from 10 manufacturers
[ECR-86] N80-11370
Renewal model of reliability for series systems - revisited
[AD-A072401] N80-11492
FAR INFRARED RADIATION
Optically pumped far infrared lasers
[AD-A071836] N80-11434
FAR ULTRAVIOLET RADIATION
Ultraviolet lasers. Citations from the international aerospace abstracts data base
[NTIS/PS-79/0861/9] N80-11462
FARADAY EFFECT
Correlation studies of protonospheric electron content over the US continent — using ATS 6 transmissions
[AD-A073080] N80-11686
FAST FOURIER TRANSFORMATIONS
What will your time series analysis computer package do? Computer packages
[CONF-7805149-2] N80-11795
FASTENERS
One step dual purpose joining technique
[NASA-CASE-LAR-12595-1] N80-11469
FATIGUE [MATERIALS]
Improved methods for predicting spectrum loading effects, phase 1 report, Volume 1: Results and discussion
[AD-A072386] N80-11071
Fracture and fatigue properties of 1Cr-Mo-V bainitic turbine rotor steels
[EPRI-NP-1023] N80-11201
Specimen size considerations in fatigue-crack growth rate testing
[HEDL-TME-78-99] N80-11521
FATIGUE LIFE
Influence of environmental cycling on the mechanical properties of composite materials, part 2
[FFA-TN-HU-1053:1-PT-2] N80-11155
The influence on the fatigue properties of aluminum AZ 74 from process variants in sulphuric acid anodizing
[FFA-TN-HU-1943] N80-11220
Analysis and synthesis of operational loads
[RAE-LIB-TRANS-2008] N80-11504
FATIGUE TESTS
Development of a realistic stress analysis for fatigue analysis of notched composite laminates
[NASA-CR-159119] N80-11146
Corrosion fatigue of a marine aluminum alloy [5456-H343] in the presence of shallow cracks
[AD-A072562] N80-11195
Fatigue testing of forged titanium
[FFA-HU-1997] N80-11224

FEASIBILITY ANALYSIS
Feasibility demonstration of a high power wide-band TWT with low AM/PM distortion
[AD-A072932] N80-11342
Concept and feasibility study on a very wide angle photographic camera for Spacelab
[BMFT-FB-W-77-17] N80-11409
FEDERAL BUDGETS
NASA authorization for fiscal year 1980
[S-REPT-96-207] N80-11951
FEEDBACK
Interannual variability of the ocean atmosphere system
[NASA-CR-162456] N80-11730
FEEDBACK CONTROL
Tri-FAST hardware-in-the-loop simulation. Volume 1: Tri-FAST hardware-in-the-loop simulation at advanced simulation center
[AD-A072919] N80-11063
Control strategies for complex systems for use in aerospace avionics
[AD-A072540] N80-11081
Entrophy analysis of feedback flight dynamic control systems
[AD-A072259] N80-11100
Low-loss charge-coupled device
[AD-A072989] N80-11339
Linear state feedback control of rigid-link manipulators
[UTIAS-TN-214] N80-11779
Optimal feedback control laws using random sampling of the observation
[CSIR-TWISK-63] N80-11827
Control of nonlinear systems
[AD-A072635] N80-11829
Quantitative synthesis of multiple loop feedback systems with large plant uncertainty
[AD-A072644] N80-11833
FEMALES
Height/weight sizing programs for womens protective garments
[AD-A072376] N80-11781
FIBER COMPOSITES
Development and fabrication of bismaleimide-graphite composites
[NASA-CR-152324] N80-11141
Micromechanics of intraply hybrid composites: Elastic and thermal properties
[NASA-TM-79253] N80-11143
Tensile and flexural strength of non-graphitic super-hybrid composites: Predictions and comparisons
[NASA-TM-79276] N80-11144
Dynamic response of damaged angleplied fiber composites
[NASA-TM-79281] N80-11145
A method for cleaning Gude-Space D96 tape
[ESA-PSS-52/QRM-32P-ISSUE-1] N80-11156
FIBER OPTICS
Self-phase modulation and transmission in optical fibers
[FUB-23-1978] N80-11318
Injection laser diodes for fiber optic communications
[AD-A072504] N80-11431
Investigation of a multimode fiber optic coupler
[AD-A071874] N80-11896
Waveguide studies for fiber optic sources
[AD-A071446] N80-11897
Fiber optic detection of low frequency underwater sound
[AD-A072829] N80-11898
FIBER ORIENTATION
Classical analyses of laminated bimodulus composite-material plates
[AD-A072276] N80-11147
FIELD EFFECT TRANSISTORS
Nanosecond pulsers for MM wave tubes
[AD-A071414] N80-11333
FIELD EMISSION
Analysis of the exposure levels and potential biological effects of the PAVE PAWS radar system
[AD-A072332] N80-11302
Radiation intensity of the PAVE PAWS radar system
[AD-A072333] N80-11303
FIGHTER AIRCRAFT
Prediction of lateral aerodynamic loads on fighter aircraft at high angles of attack
[AD-A071893] N80-11073
Simulated Mission Endurance Test [SMET] for an aircraft engine to be used in a fighter/attack role
[AD-A071907] N80-11089
FILM COOLING
Influence of coolant tube curvature on film cooling effectiveness as detected by infrared imagery
[NASA-TP-1546] N80-11087
The measurement of film cooling effectiveness in short duration wind tunnels
[VKI-TN-127] N80-11108
FILM THICKNESS
An abrading system for the measurement of oxide thickness
[TDB-319] N80-11411
FILTRATION
Studies of dust cake formation and structure in fabric filtration: Second year
[PB-297581/1] N80-11650
Test of fabric filtration materials
[PB-297500/1] N80-11660
Advanced methods for the treatment of domestic sewage --- at highway rest stops
[CONF-7810108-1] N80-11955
Removal of lagoon effluent suspended solids by a slow-rock filter
[PB-297454/1] N80-11957
FINANCE
Perspectives on intergovernmental policy and fiscal relations --- study of financial management system
[PB-297280/0] N80-11952
FINANCIAL MANAGEMENT
Perspectives on intergovernmental policy and fiscal relations --- study of financial management system
[PB-297280/0] N80-11952
FINITE DIFFERENCE THEORY
Comparison of the finite element and finite difference methods in a diagnostic regional wind field model
[UCRL-52789] N80-11728
FINITE ELEMENT METHOD
Numerical integration of equations of theory of thin-wall beams with deformable contour
N80-11018
Development of a realistic stress analysis for fatigue analysis of notched composite laminates
[NASA-CR-159119] N80-11146
Numerical solution of recirculating flow by a simple finite element recursion relation
[DP-MS-78-83] N80-11381
Nonlinear dynamic buckling of spherical caps with initial imperfections
[AD-A071450] N80-11514
Assessment of stress-strain data suitable for finite-element elastic-plastic analysis of shipping containers
[NUREG-CR-0481] N80-11520
Higher order tapered beam finite elements for vibration analysis
[ISVR-TR-99] N80-11525
Comparison of the finite element and finite difference methods in a diagnostic regional wind field model
[UCRL-52789] N80-11728
MDSFP: A computer program for elastic solution of three dimensional structures by the finite element method [LWBR development program]
[WAPD-TM-1187] N80-11816
On the use of finite element method on some acoustical problems
[D4-1979] N80-11875
FINLAND
Automated earth resources surveys using satellite and aircraft scanner data: A Finnish approach
[VTT-LU-15] N80-11547
FIRES
Cabin hazards from a large external fuel fire adjacent to an aircraft fuselage
[AD-A073494] N80-11050
Behavior of lightly confined high explosives in a jet-fuel fire
[UCRL-52659] N80-11247
FISHES
Biological evaluation of devices used for entrainment and impingement losses at thermal power plants
[CONF-7809109-1] N80-11597
Environmental studies of the south Texas outer continental shelf, 1977. Ichthyoplankton/Mackerel Eggs and larvae
[PB-296647/1] N80-11753
Environmental studies of the south Texas continental shelf. Snapper/Grouper
[PB-296645/5] N80-11755
FLAME PROPAGATION
Nonisenthalpic interaction of a planar premixed laminar flame with a parallel end wall
[AD-A071858] N80-11160
Local turbulence properties in flames from time-averaged Raman spectroscopy measurements
[SAND-78-1263C] N80-11171
FLAME RETARDANTS
Comparison of polymer flammabilities and a determination of the loss of fire retardant additives with aging
[SAND-79-0978C] N80-11230
FLAMMABILITY
Toxicity and thermal properties of polyphosphazenes
[AD-A072120] N80-11228
Comparison of polymer flammabilities and a determination of the loss of fire retardant additives with aging
[SAND-79-0978C] N80-11230
FLAPS [CONTROL SURFACES]
Selection of geometric parameters and location of nose flap on swept wing root profile from tunnel test data, 1
N80-11009
Leading edge vortex-flap experiments on a 74 deg delta wing
[NASA-CR-159161] N80-11038
FLAT PLATES
The effect of pressure gradient and external turbulence on heat transfer to a cold flat plate
[VKI-TN-128] N80-11396
Wind loads on flat plate photovoltaic array fields
[NASA-CR-162424] N80-11563
FLEXING
Tensile and flexural strength of non-graphitic super-hybrid composites: Predictions and comparisons
[NASA-TM-79276] N80-11144
FLIGHT CHARACTERISTICS
A compilation and analysis of helicopter handling qualities data. Volume 1: Data compilation
[NASA-CR-3144] N80-11097
FLIGHT CONTROL
Entrophy analysis of feedback flight dynamic control systems
[AD-A072259] N80-11100
FLIGHT CREWS
Exploratory development of aircrew windblast protection concepts
[AD-A072013] N80-11055
FLIGHT INSTRUMENTS
F-4 radar altimeter aural warning
[AD-A072870] N80-11085
FLIGHT MECHANICS
Optimal object control with worst random parameter distribution
N80-11016
FLIGHT OPTIMIZATION
Optimun shape for transpiration-cooled nosetip of a reentry vehicle
[AD-A072296] N80-11118
FLIGHT PATHS
Fuel minimal take-off path of jet lift VTOL aircraft, log no. C3558
N80-11066
FLIGHT SIMULATION
Application of modified profile analysis to function testing of simulated CTOL transport touchdown-performance data
[NASA-TP-1541] N80-11069
Manned engineering flight simulation validation, part 2: Software user's guide
[AD-A071395] N80-11105
Evaluation of transponder antenna coverage/ATCRBS during simulated flights of aircraft
[AD-A073547] N80-11275
Flight simulation fatigue crack propagation evaluation of candidate lower wing skin materials with particular consideration of spectrum truncation
[NLR-TR-77092-U] N80-11524
FLIGHT SIMULATORS
Perception and performance in flight simulators: The contribution of vestibular, visual, and auditory information
[NASA-CR-162129] N80-11103
Manned engineering flight simulation validation, part 2: Software user's guide
[AD-A071395] N80-11105
Documentation and user's manual for the Visual Detection Simulator [VDS]
[AD-A070487] N80-11107
FLIGHT TESTS
Evaluation of a wind-tunnel gust response technique including correlations with analytical and flight test results
[NASA-TP-1501] N80-11028
Feasibility tests of use of the tri turbo-3 aircraft for arctic AXBT drops
[AD-A073159] N80-11074
Helmet-mounted sight/display program: Cessna 310 flight test
[AD-A072058] N80-11786
FLIGHT TRAINING
Rotary wing proficiency-based Aviator Selection System [PASS]
[AD-A069838] N80-11774
Development of unit training and evaluation techniques for combat-ready helicopter pilots. Task 2: Assessment of ARTEP and ATM training objectives and requirements for maintaining operational readiness
[AD-A069224] N80-11776
Development of unit training and evaluation techniques for combat-ready helicopter pilots. Task 1: Development of an instruction program for individual and unit training with combat-ready pilots
[AD-A069242] N80-11777
FLOATING POINT ARITHMETIC
A comparison of low-cost microprocessors for the GPS receiver processor
[AD-A072632] N80-11793
FLORIDA
Land cover classification from Landsat data: Phase 3 of a joint DOE/NASA demonstration
[AD-A071723] N80-11535
FLOW CHARACTERISTICS
Effects of precursor heating on radiative and chemically reacting viscous flow around a Jovian entry body
[NASA-CR-3186] N80-11375
FLOW CHARTS
Linear systems analysis program, L224[QR]. Volume 2: Supplemental system design and maintenance document
[NASA-CR-2862] N80-11098
FLOW DISTRIBUTION
Height of spray produced by vertical takeoff and landing [VTOL] aircraft
[AD-A073099] N80-11075
Mixing and combustion in high speed air flows
[AD-A072642] N80-11159

Flow behind curved shock waves
[UTIAS-217] N80-11374
FLOW EQUATIONS
Exhaust flow simulation fo a one cylinder engine with a divergent exhaust pipe
N80-11483
FLOW MEASUREMENT
Supersonic flow measurements in the body vortex wake of an Ogive nose cylinder
[AD-A071337] N80-11039
Measurements of turbulence parameters in a rocket engine exhaust using a laser crossed beam correlation technique
[AASU-340] N80-11140
Current capabilities of transient two-phase flow instruments
[CONF-790505-9] N80-11402
FLOW VELOCITY
Mixed inverse problem for profile with given velocity distribution on one side and known thickness law
N80-11026
Development of critical fluidic components --- study of fluidic angular velocity sensors
[AD-A071650] N80-11379
FLOW VISUALIZATION
Streakline flow visualization study of a horseshoe vortex in a large-scale, two-dimensional turbine stator cascade
[NASA-TM-79274] N80-11376
FLUID DYNAMICS
Lectures on combustion theory
[COO-3077-153] N80-11170
FLUID FILTERS
Hot gas cleanup
[ICTIS/TR-03] N80-11647
Removal of lagoon effluent suspended solids by a slow-rock filter
[PB-297454/1] N80-11957
FLUID INJECTION
Bell Creek residual oil saturation technology test
[BETC-2180-4] N80-11546
FLUID MECHANICS
Turbulent boundary layers on surfaces of mild longitudinal curvature --- in a low speed wind tunnel
[IC-AERO-78-04] N80-11395
FLUIDICS
Development of critical fluidic components --- study of fluidic angular velocity sensors
[AD-A071650] N80-11379
FLUIDIZED BED PROCESSORS
Combustion of low grade coal
[ICTIS/TR-02] N80-11179
Use of glow discharge in fluidized beds
[NASA-CASE-ARC-11245-1] N80-11326
Hot gas cleanup
[ICTIS/TR-03] N80-11647
FLUORESCENCE
Flourescence diagnostics in two-step laser excitation of high J atoms
[UCRL-81746] N80-11449
Measurement of fluorescence decay times of laser dyes, 1. Behavior of rigid and mobile media with respect to signal extraction and signal propagation, 2
[UCRL-81568] N80-11451
Laser induced fluorescence extension to non-fluorescent materials
[UCRL-81837] N80-11454
FLUORIDES
Laser induced damage in fluoride glasses: A status report
[UCRL-81358] N80-11455
FLUORO COMPOUNDS
The C-13 study of the potential influence of thermal aging on the molecular integrity of FEFO
[MHSMP-78-32] N80-11881
FLUTTER ANALYSIS
Aero-servo-elastic stability analysis
[AD-A072797] N80-11101
FLYBY MISSIONS
Space missions to comets
[NASA-CP-2089] N80-11972
FLYWHEELS
Regenerative flywheel energy storage system
[UCRL-13982] N80-11594
Materials program for fiber composite flywheels
[UCRL-81724] N80-11618
Lateral and tilt whirl modes of flexibly mounted flywheel systems --- for energy storage
[SAND-78-7070] N80-11622
Whirling response and stability of flexibly mounted, ring-type flywheel systems
[SAND-78-7073] N80-11623
FOG
Field test of the stabilization of supersized water droplets condensed on pyrotechnically generated hygroscopic nuclei
[AD-A073035] N80-11724
Fog prediction. A bibliography with abstracts
[NTIS/PS-79/0820/5] N80-11739
FORGING
Fatigue testing of forged titanium
[FFA-HU-1997] N80-11224
FORMAT
SAMICS: Input data preparation --- Solar Array Manufacturing Industry Costing Standards
[NASA-CR-162421] N80-11570
FORMING TECHNIQUES
Contour forming of various metals: Deformation and recrystallization characteristics
[LA-UR-78-1412] N80-11205
FORTRAN
SENS: A package of FORTRAN subroutines for functional sensitivity analysis of systems of ordinary differential equations
[CSIR-SWISK-8] N80-11801
A FORTRAN algorithm for plotting contours over a triangular mesh
[AD-A072525] N80-11811
FORTRAN subroutines for M estimators in the linear model
[AD-A071744] N80-11815
FOSSIL FUELS
Department of Energy fossil energy equipment development programs
[CONF-790405-14] N80-11590
Environmental control technology for carbon dioxide
[BNL-24999] N80-11639
FOURIER TRANSFORMATION
Investigation of linear transformations for automatic cartographic analysis
[AD-A071752] N80-11536
FRACTURE MECHANICS
Improved methods for predicting spectrum loading effects, phase 1 report. volume 2: Test data
[AD-A072387] N80-11070
Development of a realistic stress analysis for fatigue analysis of notched composite laminates
[NASA-CR-159119] N80-11146
Effect of chemical environments on the fracture of ceramic surfaces
[SAND-78-1664C] N80-11229
Behaviour of steel under cyclic loading --- conference
[ICAF-1090] N80-11503
Failure criteria for reinforced concrete structures. Volume 1: Literature survey and proposed analytical models
[AD-A070643] N80-11510
Failure criteria for reinforced concrete structures. Volume 2: Analytical model and response data
[AD-A070644] N80-11511
Effect of multiaxial loading on crack growth. Volume 1: Technical summary
[AD-A072122] N80-11513
FRACTURE STRENGTH
Loss of fracture resistance in high carbon steel due to non-martensitic phases
[AD-A072051] N80-11193
Fracture and fatigue properties of 1Cr-Mo-V bainitic turbine rotor steels
[EPRI-NP-1023] N80-11201
On the influence of nickle on toughness and ductile-brittle transition in low-carbon lath martensite steels
[UPTEC-78-53-R] N80-11223
FREE CONVECTION
Radiative and free convective heat transfer from a containerless sphere
[NASA-TM-78249] N80-11377
Crystal growth from the vapor phase with an inert component present
[D-268] N80-11933
FREE ELECTRON LASERS
Effects of longitudinal electric self-field on the acceptable energy spread in a free electron laser
[UCID-17985] N80-11452
FREE ELECTRONS
Free electron laser and its possible developments
[BNL-25857] N80-11445
FREE ENERGY
Study of boundary structures
[AD-A071710] N80-11843
FREQUENCY ASSIGNMENT
Technology assessment for future MILSATCOM systems: The EHF bands
[AD-A071886] N80-11290
FREQUENCY MODULATION
Design of a Multichannel FM/FM telemetry system for high G environment applications
[SAND-78-8042] N80-11133
FREQUENCY RANGES
Prospects and limitations for use of frequency spectrum from 40 to 300 GHz
[NASA-TM-80812] N80-11272
FREQUENCY SCANNING
Feasibility study for the Spacelab User Program. Measurement of terrestrial noise, radio control
[BMFT-FB-W-78-14] N80-11115
FREQUENCY SHIFT
A loop for tracking the frequency of a pulsed sinusoid
[AD-A072750] N80-11340
FREQUENCY STABILITY
Resonators for acceleration environments
[AD-A072741] N80-11924
FRESNEL REGION
Fresnel zone correction plates for the electron microscope
[UCRL-TRANS-11440] N80-11900
FRICTION
Ranking tires using a transient speed-time cycle
[PB-297756/9] N80-11487
FRICTION DRAG
A survey of the literature on surface roughness effects on the drag of subsonic aircraft
[FFA-AU-1224] N80-11049
Aircraft rolling resistance in loose, dry snow: A theoretical analysis
[VTI-173-A] N80-11077
FUEL CELLS
Influence of electrolyte composition on electrode kinetics in the molten carbonate fuel cell
[CONF-781063-2] N80-11615
FUEL CONSUMPTION
Fuel minimal take-off path of jet lift VTOL aircraft, log no. C3558
N80-11066
FUEL CORROSION
Combustion of low grade coal
[ICTIS/TR-02] N80-11179
FUEL SYSTEMS
Combustion of low grade coal
[ICTIS/TR-02] N80-11179
FUEL TESTS
Systems analysis of arctic fuels dispensing equipment
[AD-A071815] N80-11106
FUELS
Fundamental characterization of alternate fuel effects in continuous combustion systems
[SAN-1543-12] N80-11244
FUNCTIONAL ANALYSIS
Electromagnetic boundary-valve problems based upon a modification of residue calculus and function theoretic techniques
[PB-297305/5] N80-11867
FUNCTIONS [MATHEMATICS]
Minimum l-p-norm controls for time-varying linear dynamic systems
[CSIR-TWISK-49] N80-11828
Functional sensitivity for ordinary differential equations
[CSIR-TWISK-65] N80-11837
Vertex function and crossing symmetry --- quantum mechanical many body problem
[CSIR-TWISK-53] N80-11841
FUSELAGES
Selecting the passenger airplane fuselage
N80-11024
Fuselage and nozzle pressure distributions on a 1/12-scale F-15 propulsion model at transonic speeds --- conducted in langley 16 foot transonic tunnel
[NASA-TP-1521] N80-11036
Cabin hazards from a large external fuel fire adjacent to an aircraft fuselage
[AD-A073494] N80-11050
FUSION [MELTING]
Induction heating gun
[NASA-CASE-LAR-12540-1] N80-11468
One step dual purpose joining technique
[NASA-CASE-LAR-12595-1] N80-11469
FUSION REACTORS
Advanced lasers for fusion applications --- krypton fluoride laser applications for fusion reactors
[UCRL-81940] N80-11442
FUSION WELDING
Deleterious effect of fusing fluids on printed wiring boards
[AD-A072716] N80-11341

G

GALACTIC STRUCTURE
Photometric properties of G, K and M stars in relation to galatic structure and evolution
[PUBL-SER-B-FASC-5] N80-11969
GALLIUM ARSENIDES
Oxidation of gallium arsenide in a plasma multiple device. Study of the MOS structures obtained
[LEP-79/62.SME-687-A] N80-11181
Gallium arsenide lasers. Citations from the international aerospace abstracts data base
[NTIS/PS-79/0821/3] N80-11458
Electron radiation damage of [AlGa] As-GaAs solar cells
[NASA-CR-162425] N80-11564
Study of the electronic surface states of 3-V compounds --- study of surface properties of gallium arsenides to understand metal oxide semiconductors
[AD-A073014] N80-11925
GAMMA FUNCTION
Computer generation of bivariate gamma random vectors
[AD-A072407] N80-11844
GAS ANALYSIS
Laboratory coal gasifier facility
[UCRL-82602] N80-11245
USPHS/NIOSH membrane filter method for evaluating airborne asbestos fibers
[PB-297731/2] N80-11663
GAS CHROMATOGRAPHY
An EPA manual for organics analysis using gas chromatography-mass spectrometry
[PB-297164/6] N80-11182
Ambient air carcinogenic vapors, improved sampling and analytical techniques and field studies
[PB-297932/6] N80-11185

GAS DYNAMICS
New computational models in continuum mechanics
[AD-A071418] N80-11041
GAS FLOW
Gas flow through porous barriers
[LBL-8283] N80-11388
Development of improved abradable compressor gas path seal
[AD-A072171] N80-11474
GAS GENERATORS
Gas generator research and development: BI-GAS process
[FE-1207-49] N80-11588
GAS INJECTION
Oil recovery by carbon dioxide injection --- West Virginia
[ORO-5301-34] N80-11545
GAS LASERS
Compilation of data relevant to nuclear pumped lasers, volume 1
[AD-A071360] N80-11437
Radial electron beam laser excitation: The REBLE report
[SA[illegible]8-2005] N80-11450
Ultraviolet lasers. Citations from the international aerospace abstracts data base
[NTIS/PS-79/0861/9] N80-11462
Kinetic studies of gas mixtures and their application to gas lasers and pollutant detection
[CONF-781113-6] N80-11637
Electronics research at the University of Texas at Austin
[AD-A072436] N80-11987
GAS MIXTURES
Kinetic studies of gas mixtures and their application to gas lasers and pollutant detection
[CONF-781113-6] N80-11637
GAS RECOVERY
Methane recovery from sanitary landfills; gas recovery system installation and testing
[PB-296622/4] N80-11254
GAS TRANSPORT
The use of a trajectory model for studying interregional transport of air pollution
[KNMI-WR-79-6] N80-11645
GAS TURBINE ENGINES
Optimal thermogasdynamic design of gas turbine engines using element prototypes, 1
N80-11007
Simulated Mission Endurance Test [SMET] for an aircraft engine to be used in a fighter/attack role
[AD-A071907] N80-11089
Fundamental characterization of alternate fuel effects in continuous combustion systems
[SAN-1543-12] N80-11244
GAS TURBINES
Brittle materials design, high temperature gas turbine
[AD-A071750] N80-11090
Bladed disk dynamic response --- for gas turbine rotor blades
[AD-A071975] N80-11091
Corrosion resistant thermal barrier coating --- protecting gas turbines and other heat engine parts
[NASA-CASE-LEW-13088-1] N80-11142
GAS-METAL INTERACTIONS
Catalysis by transition metal compounds --- cobalt oxide
[COO-1198-1234] N80-11217
GAS-SOLID INTERACTIONS
Effect of chemical environments on the fracture of ceramic surfaces
[SAND-78-1664C] N80-11229
GAS-SOLID INTERFACES
High temperature gas energy transfer
[AD-A072727] N80-11884
GASDYNAMIC LASERS
Gas dynamic lasers. A bibliograpy with abstracts
[NTIS/PS-79/0839/5] N80-11467
GASOLINE
Economics of gasoline production from underground coal gasification via mobil-M process
[CONF-790405-12] N80-11246
Reduction of air emissions from gasoline storage tanks
[PB-297976/3] N80-11659
GELS
Performance of a gel permeation chromatograph and its usefulness in examining mixtures of organic materials --- epoxy resin aircraft adhesives
[MRL-R-725] N80-11158
GENERAL AVIATION AIRCRAFT
New aircraft technology: Report on the Farnborough International Air Show
[PB-298345/0] N80-11078
Light airplane crash tests at three pitch angles
[NASA-TP-1481] N80-11505
GEODESY
A covariance approximation procedure --- for geodetic data processing
[AD-A072853] N80-11541
Space research in the Netherlands, 1978
N80-11996
GEODETIC SURVEYS
A covariance approximation procedure --- for geodetic data processing
[AD-A072853] N80-11541
GEOGRAPHY
Physical regionalization of coastal ecosystems of the United States and its territories
[PB-297143/0] N80-11661
GEOIDS
Improved determinations of the earth's gravity field
[AD-A070186] N80-11681
GEOLOGICAL FAULTS
Earth's crust under the oceans
N80-11528
GEOLOGICAL SURVEYS
Geothermal exploration methods and results: Inland states
[LA-UR-79-665] N80-11543
GEOLOGY
Geophysics, astronomy and space, no. 450
[JPRS-73946] N80-11527
GEOMORPHOLOGY
Physical regionalization of coastal ecosystems of the United States and its territories
[PB-297143/0] N80-11661
GEOPHYSICS
Report on Peru scintillation tests, March 1978
[AD-A072994] N80-11685
GEOS SATELLITES [ESA]
Space research in Denmark
N80-11994
GEOSTROPHIC WIND
Verification of twelve and 24 hour geostrophic wind forecasts at 850 mbar using BK3 at IJmuiden over the period of 1 October 1972 to 30 November 1976
[KNMI-WR-79-7] N80-11738
GEOTHERMAL ENERGY CONVERSION
Geothermal energy for industrial application
[LBL-8919] N80-11579
Development of integrated thermionic circuits for geothermal high-temperature applications
[LA-UR-79-723] N80-11592
INEL geothermal environmental program
[TREE-1340] N80-11595
User manual for GEOCITY: A computer model for geothermal district heating cost analysis
[PNL-2742] N80-11605
Heber geothermal demonstration power plant
[EPRI-ER-863] N80-11607
A manual for cataloging and indexing documents --- geothermal energy data base
[LBL-4432-REV-1] N80-11946
GEOTHERMAL RESOURCES
Quartz resonator pressure gauge: Design and fabrication technology
[SAND-78-2264] N80-11403
Geothermal exploration methods and results: Inland states
[LA-UR-79-665] N80-11543
Geothermal energy for industrial application
[LBL-8919] N80-11579
INEL geothermal environmental program
[TREE-1340] N80-11595
User manual for GEOCITY: A computer model for geothermal district heating cost analysis
[PNL-2742] N80-11605
Seismic refraction investigation of the Salton Sea geothermal area, Imperial Valley, California
[PB-296547/3] N80-11711
GERMANIUM
The effect of crystal growth direction on the energy resolution of high-purity germanium detectors --- radiation detectors
[LBL-8133] N80-11928
GERMANIUM DIODES
Deep level transient spectroscopy of high purity germanium diodes/detectors
[LBL-8140] N80-11176
GERMANY
Development of starting points for a selective support program for civil avionics technologies
[BMFT-FB-W-78-21] N80-11086
The use of a trajectory model for studying interregional transport of air pollution
[KNMI-WR-79-6] N80-11645
GLACIAL DRIFT
Determinations of hydrologic parameters for glacial tills in Connecticut
[PB-297578/7] N80-11548
GLASS
Etching study for the MC2980 glass ceramic preform
[SAND-78-1295] N80-11235
Measurement of diffusion coefficients of short-lived species in solution and in amorphous glasses
[NVO-0535-7] N80-11236
GLASS FIBER REINFORCED PLASTICS
Dynamic response of damaged angleplied fiber composites
[NASA-TM-79281] N80-11145
Glass fibre reinforced, sprayed coating for sealing thermal insulation containing asbestos
[TDB-325] N80-11237
GLOBAL AIR POLLUTION
Implementation plan for the determination of the atmospheric contribution of petroleum hydrocarbons to the oceans.
[WMO-504] N80-11644
GLOBAL ATMOSPHERIC RESEARCH PROGRAM
First session of the WAMEX scientific and management regional committee
[GARP-SPEC-REPT-31] N80-11731
Report of activities on world meteorological research, applications and water resources development
[WMO-529] N80-11733
Report of the fifteenth session of the Joint Organizing Committee
N80-11734
GLOW DISCHARGES
Use of glow discharge in fluidized beds
[NASA-CASE-ARC-11245-1] N80-11326
GLUCOSE
The 5-thio-d-glucose thermoregulatory effects in mice at various temperatures
[AD-A069511] N80-11757
GOLD COATINGS
Pulse plating of hard gold electrodeposits
[BDX-613-2165] N80-11207
The deposition of gold - copper - cadmium alloys
[DRIC-TRANS-5465] N80-11218
GOVERNMENT/INDUSTRY RELATIONS
Development of starting points for a selective support program for civil avionics technologies
[BMFT-FB-W-78-21] N80-11086
GOVERNMENTS
Lack of accountability in Government public information and publishing programs
[GPO-45-775] N80-11943
Perspectives on intergovernmental policy and fiscal relations --- study of financial management system
[PB-297280/0] N80-11952
GRAIN BOUNDARIES
Influence of multiaxial stress states, stress gradients and elastic anisotropy on the evaluation of residual stresses by X-rays
[AD-A067909] N80-11190
GRAPHITE
Development and fabrication of bismaleimide-graphite composites
[NASA-CR-152324] N80-11141
Analytical and experimental evaluation of two designs for a graphite/epoxy antenna feed truss for a communications satellite
[AD-A072484] N80-11151
Chemical vapor deposition of TiB2 on graphite
[SAND-78-1794C] N80-11173
GRAPHITE-EPOXY COMPOSITE MATERIALS
Dynamic response of damaged angleplied fiber composites
[NASA-TM-79281] N80-11145
Transient hydrothermal stresses in composites: Coupling of moisture and heat with temperature varying diffusivity --- graphite-epoxy composite materials
[AD-A072613] N80-11149
HPLC monitoring of graphite-epoxy prepreg aging
[AD-A072294] N80-11150
Electron and proton absorption calculations for a graphite/epoxy composite model --- large space structures
[NASA-TP-1568] N80-11226
Summer research fellowship program
[NASA-CR-159153] N80-11940
GRAVITATIONAL FIELDS
Improved determinations of the earth's gravity field
[AD-A070186] N80-11681
GRAVITY GRADIOMETERS
Study to development gradiometer techniques --- filtering of gravity-gradiometer readings onboard
[AD-A072821] N80-11688
GREENHOUSE EFFECT
Carbon dioxide and the greenhouse effect: An unresolved problem
[ICTIS/ER-01] N80-11708
GRIDS
The nested grid model
[PB-299046/3] N80-11745
GROUND EFFECT [AERODYNAMICS]
Surface-effect components of aerodynamic characteristics of air-cushion vehicle with ram pressurization
N80-11005
GROUND EFFECT MACHINES
Surface-effect components of aerodynamic characteristics of air-cushion vehicle with ram pressurization
N80-11005
GROUND SUPPORT EQUIPMENT
The RSRE satellite communications test facility
[RSRE-78008] N80-11119
GROUND WATER
Two-dimensional transient dispersion and adsorption in porous media
[UCRL-81970] N80-11386
Detection of arctic water supplies with geophysical techniques
[AD-A072157] N80-11538
Effects of pumping on ground-water levels near, Taylorsville, Bartholomew County, Indiana
[PB-298244/5] N80-11710
GROUP THEORY
Lie-group theory for symbolic integration of first-order differential equations: A modern treatment
[LA-UR-79-251] N80-11865
GULF OF MEXICO
Environmental studies of the South Texas continental shelf, 1976 - 1977. Historical zooplankton
[PB-296646/3] N80-11754
GUST LOADS
Evaluation of a wind-tunnel gust response technique including correlations with analytical and flight test results
[NASA-TP-1501] N80-11028

Exploratory development of aircrew windblast protection concepts
[AD-A072013] N80-11055
Wind loads on flat plate photovoltaic array fields
[NASA-CR-162424] N80-11563

H

H-53 HELICOPTER
A compilation and analysis of helicopter handling qualities data. Volume 1: Data compilation
[NASA-CR-3144] N80-11097
HALIDES
Resonance Raman spectra of metal halide vapor complexes
[CONF-780941-8] N80-11175
HALLEY'S COMET
Comet Halley and history
N80-11978
Ion propulsion and Comet Halley rendezvous
N80-11979
HAMILTONIAN FUNCTIONS
Noether's theory in classical nonconservative mechanics
[CSIR-TWISK-66] N80-11836
HARDENING [MATERIALS]
Pulse plating of hard gold electrodeposits
[BDX-613-2165] N80-11207
HARMONIC OSCILLATION
Harmonic oscillations of annular wing in steady ideal fluid flow
N80-11019
HAZARDS
Development of an emergency response program for transportation of hazardous waste
[PB-297438/4] N80-11962
HEALTH
National environmental/energy workforce assessment, phase 3. Composite: Environmental science/health --- post-secondary educational directory
[PB-298590/1] N80-11668
HEAO
Low latitude atmospheric X-rays observed by HEAO-1
[AD-A072722] N80-11684
HEAT EXCHANGERS
Simplified inelastic analysis in helical coil heat exchanger design
[GA-A-15188] N80-11518
Energy storage for Tokamak reactor cycles
[PPPL-1511] N80-11569
HEAT MEASUREMENT
Description of experimental techniques used in heat capacity measurements of adsorbed helium
[UPTEC-78-18-R] N80-11266
HEAT OF SOLUTION
Solution microcalorimeter for measuring heats of solution of radioactive elements and compounds
[ORO-4447-081] N80-11405
HEAT PIPES
Heat pipe cooling of power processing magnetics
[NASA-TM-79270] N80-11327
Cooling aluminum molds using heat pipes
[BDX-613-2039-REV] N80-11384
HEAT PUMPS
Heat pump centered integrated community energy systems: System development
[ANL/ICES-TM-27] N80-11571
Heat pump centered integrated community energy systems: Systems development, Dubin-Bloome Associates
[ANL/ICES-TM-29] N80-11572
High COP heat pump system, phase 1, results
[HCP/M5056-01] N80-11573
Heat pump centered integrated community energy systems; System development
[ANL-ICES-TM-28] N80-11574
Heat pump centered integrated community energy system; system development
[ANL/ICES-TM-31] N80-11575
DOE heat pump centered integrated community energy systems project
[CONF-790362-1] N80-11586
HEAT RESISTANT ALLOYS
Effect of thermally induced porosity on an as-HIP powder metallurgy superalloy
[NASA-TM-79263] N80-11189
Hot corrosion degradation of metals and alloy: A unified theory --- nickel and cobalt based alloys
[AD-A072645] N80-11194
HEAT SOURCES
General-purpose heat source development. Phase 1: Design requirements
[LA-7385-SR] N80-11608
General-purpose heat source project space nuclear safety program and radioisotopic terrestrial safety program --- plutonium oxide
[LA-7519-PR] N80-11889
HEAT STORAGE
Energy storage for Tokamak reactor cycles
[PPPL-1511] N80-11569
Case study of the Brownell low energy requirement house, thermal storage analysis
[BNL-25832] N80-11584
Energy storage for solar air conditioning applications utilizing a form-stable, high density polyethylene pellet bed
[MLM-2598[OP]] N80-11603
Solar energy with latent heat storage: Fundamentals and applications
[ASSA-10/1978] N80-11632
HEAT TRANSFER
Heat transfer correlation development and assessment: A summary and assessment of return to nucleate boiling phenomena during blowdown tests conducted at the Idaho National Engineering Laboratory
[INEL-CDAP-TR-054] N80-11387
PRSA hydrogen tank thermal acoustic oscillation study
[NASA-CR-152319] N80-11470
Composition stability and degradation products of selected materials for solar heating and cooling
[SAND-78-0681] N80-11591
Proceedings: Solar Thermal Power User Review Panel Meeting
[SERI/TP-69-221] N80-11598
Environmental effects of heat and moisture release from atmospheric spray cooling systems
[CONF-780520-7] N80-11642
HEAT TRANSFER COEFFICIENTS
The measurement of film cooling effectiveness in short duration wind tunnels
[VKI-TN-127] N80-11108
HEAT TRANSMISSION
Geothermal exploration methods and results: Inland states
[LA-UR-79-665] N80-11543
HEATING
Heat pump centered integrated community energy system; system development
[ANL/ICES-TM-31] N80-11575
User manual for GEOCITY: A computer model for geothermal district heating cost analysis
[PNL-2742] N80-11605
HEAVY IONS
Space charge limited transport and bunching of non K-V beams
[AD-A072417] N80-11877
HELICAL INDUCERS
Direct comparison between circularly and linearly polarized RF field in ICRF heating of a toroidal plasma
[IPPJ-416] N80-11905
HELICAL WINDINGS
Simplified inelastic analysis in helical coil heat exchanger design
[GA-A-15188] N80-11518
HELICOPTER CONTROL
A compilation and analysis of helicopter handling qualities data. Volume 1: Data compilation
[NASA-CR-3144] N80-11097
HELICOPTER DESIGN
Avionic system architecture investigation [AVSAR II]
[AD-A071743] N80-11080
HELICOPTER WAKES
Prediction of helicopter rotor downwash in hover and vertical flight
[ARL-AERO-REPT-150] N80-11032
HELICOPTERS
Prediction of helicopter rotor downwash in hover and vertical flight
[ARL-AERO-REPT-150] N80-11032
New aircraft technology: Report on the Farnborough International Air Show
[PB-298345/0] N80-11078
Development of unit training and evaluation techniques for combat-ready helicopter pilots. Task 2: Assessment of ARTEP and ATM training objectives and requirements for maintaining operational readiness
[AD-A069224] N80-11776
Development of unit training and evaluation techniques for combat-ready helicopter pilots. Task 1: Development of an instruction program for individual and unit training with combat-ready pilots
[AD-A069242] N80-11777
HELIOS 1
Design and operation of the search-coil magnetometer experiment on the solar probe HELIOS
[BMFT-FB-W-77-25] N80-11129
HELIOS 2
Design and operation of the search-coil magnetometer experiment on the solar probe HELIOS
[BMFT-FB-W-77-25] N80-11129
HELIOSTATS
On the behaviour of heliostats in the extreme winter climate of the Swiss Mountains
[AED-CONF-78-212-001] N80-11611
HELIUM
Transport properties for ablation products: An illustration using the He-C2h interaction --- jouian atmosphere
N80-11373
Gas flow through porous barriers
[LBL-8283] N80-11388
HELIUM ATOMS
Atomic and molecular interaction theory
[AD-A072124] N80-11878
HELIUM ISOTOPES
Desorption heat capacity of 3He adsorbed on solid argon
[UPTEC-78-16-R] N80-11264
Desorption heat capacity of 4He adsorbed on solid neon
[UPTEC-78-17-R] N80-11265
Description of experimental techniques used in heat capacity measurements of adsorbed helium
[UPTEC-78-18-R] N80-11266
Heat capacity of submonolayers of 3He adsorbed on solid neon
[UPTEC-78-31-R] N80-11267
HELIUM-NEON LASERS
Design of a high precision dilatometer using laser interferometry
[SAND-78-1796] N80-11407
HELMETS
Integrated helmet-mounted sight/display program: Coating technology
[AD-A072060] N80-11782
Helmet-mounted displays: An experimental investigation of display luminance and contrast
[AD-A072059] N80-11783
Helmet-mounted displays: A computer-assisted analysis of day-night visual requirements
[AD-A072061] N80-11784
The role of the upper field of view in selected HMS/D visual tasks
[AD-A072064] N80-11785
Helmet-mounted sight/display program: Cessna 310 flight test
[AD-A072058] N80-11786
Head aiming/tracking accuracy in a helicopter environment
[AD-A071359] N80-11788
HERMETIC SEALS
Rectangular flat-pack lids under external pressure improved formulas for screening and design, revised
[AD-A072421] N80-11329
Hermetic sealing of hybrid microcircuits: Initial capability development
[BDX-613-1930-REV] N80-11350
HETEROCYCLIC COMPOUNDS
Potential chemical systems for intramolecular cycloaddition cures
[AD-A072526] N80-11152
HEURISTIC METHODS
Heuristics for knowledge acquisition from maps
[AD-A073126] N80-11540
HF LASERS
Hydrogen flouride and deuterium fluoride lasers. Citations from the international aerospace abstracts data base
[NTIS/PS-79/0860/1] N80-11463
HIGH ACCELERATION
Ejection seat for high G escape
[AD-A072444] N80-11054
HIGH ALTITUDE ENVIRONMENTS
Altitude acclimatization. Citations from the International Aerospace Abstracts data base
[NTIS/PS-79/0857/7] N80-11770
HIGH ENERGY ELECTRONS
Direct photon emission in positron electron annihilation processes
[PM/79/9] N80-11887
HIGH ENERGY INTERACTIONS
Unitarity restrictions on semi-classical approximations to certain functional integrals
[COO-313TA-343] N80-11852
Direct photon emission in positron electron annihilation processes
[PM/79/9] N80-11887
Theoretical and high energy physics
[COO-1764-342] N80-11912
HIGH FREQUENCIES
Preliminary dielectric studies. Spir-o-line cable for application at power frequencies
[HCP/T5054-01] N80-11351
HIGH GRAVITY ENVIRONMENTS
Design of a Multichannel FM/FM telemetry system for high G environment applications
[SAND-78-8042] N80-11133
HIGH SPEED CAMERAS
Strain rate effects on ultimate strain of copper
[AD-A072175] N80-11192
HIGH STRENGTH STEELS
Fatigue testing of precipitating steel 1745 [Custom 455] with machining as the final process
[FFA-TN-HU-1965] N80-11221
HIGH TEMPERATURE ENVIRONMENTS
Brittle materials design, high temperature gas turbine
[AD-A071750] N80-11090
Corrosion resistant thermal barrier coating --- protecting gas turbines and other heat engine parts
[NASA-CASE-LEW-13088-1] N80-11142
HIGH TEMPERATURE GASES
Hot gas cleanup
[ICTIS/TR-03] N80-11647
Extended tests of Saffil aluminum filter media --- for hot gas cleanup
[PB-297567/0] N80-11652
High temperature gas energy transfer
[AD-A072727] N80-11884
HIGH TEMPERATURE RESEARCH
A thermogravimetric system for investigating gas-metal reactions at elevated temperatures
[MRL-R-726] N80-11187
Thermodynamics of high temperature brines
[LBL-8973] N80-11936
HIGH TEMPERATURE TESTS
Brittle materials design, high temperature gas turbine
[AD-A071750] N80-11090

Program to discover materials suitable for service under hostile conditions obtaining in equipment for the gasification of coal and other solid fuels
[FE-1784-42] N80-11248
HIGH VOLTAGES
Development of a 3 MV pulse transformer
[SAND-79-0813] N80-11344
HIGHWAYS
Advanced methods for the treatment of domestic sewage --- at highway rest stops
[CONF-7810108-1] N80-11955
HILSCH TUBES
Influence of coolant tube curvature on film cooling effectiveness as detected by infrared imagery
[NASA-TP-1546] N80-11087
HISTORIES
A history of land application as a treatment alternative
[PB-298227/0] N80-11964
HOMING
Tri-FAST hardware-in-the-loop simulation. Volume 1: Tri-FAST hardware-in-the-loop simulation at advanced simulation center
[AD-A072919] N80-11063
Distributed source generation for RF environmental modeling for hardware-in-the-loop missile guidance simulation
[AD-A072927] N80-11126
HOMING DEVICES
Laser induced luminescence of military targets
[AD-A073200] N80-11441
HOT PRESSING
Effect of thermally induced porosity on an as-HIP powder metallurgy superalloy
[NASA-TM-79263] N80-11189
HOVERING
Prediction of helicopter rotor downwash in hover and vertical flight
[ARL-AERO-REPT-150] N80-11032
HUMAN BEHAVIOR
The scope, limits, and training implications of three models of aircraft pilot emergency response behavior
[AD-A071320] N80-11773
HUMAN BEINGS
Spatial population analysis: Methods and computer programs
[IIASA-RR-78-18] N80-11939
HUMAN FACTORS ENGINEERING
Ejection seat for high G escape
[AD-A072444] N80-11054
Helmet-mounted sight/display program: Cessna 310 flight test
[AD-A072058] N80-11786
Operational pilot factors analysis report
[AD-A072063] N80-11787
HUMAN PERFORMANCE
Hypothermia induced by chlorpromazine or L-tryptophan effects on treadmill performance in the heat
[AD-A069849] N80-11764
Human failure detection and resource allocation in dynamic environment
[AD-A069821] N80-11778
Operational pilot factors analysis report
[AD-A072063] N80-11787
HUMAN TOLERANCES
Altitude acclimatization. Citations from the International Aerospace Abstracts data base
[NTIS/PS-79/0857/7] N80-11770
HUMIDITY
On surface-based advective radar ducts
[AD-A071454] N80-11289
Interaction of low levels of ozone and relative humidity on leafy vegetables
[PB-297062/2] N80-11658
Convection induced temperature change in GATE
[PB-298130/6] N80-11712
HYBRID CIRCUITS
Hermetic sealing of hybrid microcircuits: Initial capability development
[BDX-613-1930-REV] N80-11350
HYBRID PROPULSION
Hydrogen-electric power drives
[SLAC-PUB-2203] N80-11604
HYDRAULIC CONTROL
Response of a double tube sheet structure to hydraulic pressure transients
[DP-MS-78-73] N80-11519
HYDRAULIC EQUIPMENT
Effect of vertical scale distortion on the temperature field of a thermal-hydraulic model
[PB-297274/3] N80-11551
HYDRAULIC JETS
Development efforts on a diffuser and pump inlet for a water jet propulsion system
[AD-A072567] N80-11260
HYDROCARBON FUELS
Fundamental characterization of alternate fuel effects in continuous combustion systems
[SAN-1543-12] N80-11244
HYDROCARBON POISONING
Implementation plan for the determination of the atmospheric contribution of petroleum hydrocarbons to the oceans.
[WMO-504] N80-11644
HYDROCARBONS
X-ray excited optical luminescence of polynuclear aromatic hydrocarbons
[IS-T-856] N80-11165
Lectures on combustion theory
[COO-3077-153] N80-11170
Transport properties for ablation products: An illustration using the He-C2h interaction --- jovian atmosphere
N80-11373
Analysis of organic pollutants by synchronous luminescence spectrometry
[CONF-781039-8] N80-11638
Study of the nature of ozone, oxides of nitrogen, and nonmethane hydrocarbons in Tulsa, Oklahoma. Volume 2: Data tabulation
[PB-297801/3] N80-11649
Summer research fellowship program
[NASA-CR-159153] N80-11940
HYDRODYNAMIC EQUATIONS
Almost periodic N-soliton solutions of the nonlinear hydrodynamic Kaup equation
[PM/79/10] N80-11397
HYDROELECTRIC POWER STATIONS
Effect of vertical scale distortion on the temperature field of a thermal-hydraulic model
[PB-297274/3] N80-11551
Biological evaluation of devices used for entrainment and impingement losses at thermal power plants
[CONF-7809109-1] N80-11597
HYDROGEN
Partial molar volumes of hydrogen and deuterium in niobium and vanadium
[IS-T-839] N80-11172
Acoustic emission from hydrogen saturated type 304L stainless steel
[DP-MS-78-50] N80-11208
PRSA hydrogen tank thermal acoustic oscillation study
[NASA-CR-152319] N80-11470
HYDROGEN ATOMS
Atomic and molecular interaction theory
[AD-A072124] N80-11878
HYDROGEN EMBRITTLEMENT
Effect of chemical environments on the fracture of ceramic surfaces
[SAND-78-1664C] N80-11229
HYDROGEN FUELS
Hydrogen-electric power drives
[SLAC-PUB-2203] N80-11604
HYDROGEN PLASMA
Measurements of electron density and temperature profiles in a gas blanket experiment
[TRITA-PFU-79-03] N80-11915
HYDROGEN PRODUCTION
Economic of hydrogen production and liquefaction updated to 1980
[NASA-CR-159163] N80-11238
HYDROGEOLOGY
Determinations of hydrologic parameters for glacial tills in Connecticut
[PB-297578/7] N80-11548
Physical regionalization of coastal ecosystems of the United States and its territories
[PB-297143/0] N80-11661
HYDROLOGY
Institutional constraints on land management for water resource protection in urban and suburban watersheds
[PB-298271/8] N80-11549
Remote sensing applied to hydrology. A bibliography with abstracts
[NTIS/PS-79/0845/2] N80-11553
National environmental/energy workforce assessment. Phase 3: Potable water programs --- indexes to potable water education programs
[PB-298583/6] N80-11665
Report of activities on world meteorological research, applications and water resources development
[WMO-529] N80-11733
HYDROLOGY MODELS
Determinations of hydrologic parameters for glacial tills in Connecticut
[PB-297578/7] N80-11548
HYDROMETEOROLOGY
Radio communications at extremely high frequencies: The use of meteorological data
[FUB-27-1978] N80-11320
HYDROPHONES
Development and evaluation of an experimental parametric acoustic receiving array [PARRAY]
[AD-A072307] N80-11873
HYPERSONIC VEHICLES
Design and fabrication of elevon cove thermal protection systems for aerospace vehicles
[NASA-CR-159055] N80-11134
HYPERSONIC WIND TUNNELS
Pitot pressure and total temperature profile measurements in a hypersonic, turbulent boundary layer at M = 9
[IC-AERO-79-01] N80-11048
HYPOTHERMIA
Hypothermia induced by chlorpromazine or L-tryptophan effects on treadmill performance in the heat
[AD-A069849] N80-11764

I

ICE
Airborne measurements of cloud forming nuclei and aerosol particles at Kennedy Space Center, Florida
[NASA-CR-160359] N80-11716
ICE ENVIRONMENTS
On the behaviour of heliostats in the extreme winter climate of the Swiss Mountains
[AED-CONF-78-212-001] N80-11611
ICHTHYOLOGY
Environmental studies of the south Texas outer continental shelf, 1977. Ichthyoplankton/Mackerel Eggs and larvae
[PB-296647/1] N80-11753
IDAHO
INEL geothermal environmental program
[TREE-1340] N80-11595
IGNITION LIMITS
Survey of the activities concerning sensitivity test methods for explosives
[PML-1979-20] N80-11253
IMAGE ENHANCEMENT
Preprocessing of PHERMEX flash radiographic images with Haar and adaptive filtering --- enhancement of lines and/or edges
[LA-7561-MS] N80-11404
IMAGE PROCESSING
Intelligent bandwidth compression
[AD-A071692] N80-11283
Optical power spectrum analysis of processed imagery
[AD-A073083] N80-11335
Processing and display techniques for multispectral satellite imagery
[AD-A072509] N80-11534
Satellite support to HIPLEX: Summary of results, 1976 - 1978
[PB-297839/3] N80-11729
Relaxation applied to matching quantitative relational structures
[AD-A071604] N80-11808
Architecture for higher level digital image processing
[AD-A071599] N80-11832
Strip detection using relaxation
[AD-A071606] N80-11894
IMAGES
The relationship between distortion and image quality: Sampling procedures and accuracy
[FUB-51-1977] N80-11317
IMAGING TECHNIQUES
Laser scanning camera
[TDB-324] N80-11457
Shortrange forecasting through extrapolation of satellite imagery patterns. Part 1: Motion vector techniques
[AD-A073081] N80-11726
Wide angle optical systems --- multispectral scanner
[NASA-CASE-MSC-18373-1] N80-11892
Activities report of the Image Laboratory
[ENST-D-79005] N80-11901
IMPACT TESTING MACHINES
Studies of abrasive wear in a modified impact testing machine --- on low carbon steels
[UPTEC-78-79-R] N80-11481
IMPACT TESTS
Light airplane crash tests at three pitch angles
[NASA-TP-1481] N80-11505
Summer research fellowship program
[NASA-CR-159153] N80-11940
IMPEDANCE MATCHING
An analysis of the disk microstrip antenna, part 2
[AD-A070794] N80-11294
IMPELLERS
One dimensional design of centrifugal compressors taking into account flow separation in the impeller
[VKI-TN-129] N80-11486
IMPERIAL VALLEY [CA]
Seismic refraction investigation of the Salton Sea geothermal area, Imperial Valley, California
[PB-296547/3] N80-11711
IMPURITIES
Effects of impurities on the weldability of electroformed nickel
[NASA-CR-162455] N80-11214
IN-FLIGHT MONITORING
Flight-measured afterbody pressure coefficients from an airplane having twin side-by-side jet engines for Mach numbers from 0.6 to 1.6
[NASA-TP-1549] N80-11035
STARPAHC space-oriented medical evaluation --- telemedicine system
[NASA-CR-160360] N80-11763
INCOMPRESSIBLE FLOW
Analytic formulas for wing profile aerodynamic characteristics in incompressible flow
N80-11010
Harmonic oscillations of annular wing in steady ideal fluid flow
N80-11019
INDEXES [DOCUMENTATION]
National environmental/energy workshop assessment, phase 3. Energy programs --- directory of courses available
[PB-298587/7] N80-11634

National environmental/energy workforce assessment, phase 3. Solid waste programs --- indexes for solid wastes management education
[PB-298586/9] N80-11640
National environmental/energy workforce assessment, phase 3. Pesticides and toxicology programs --- post-secondary educational directory
[PB-298582/8] N80-11664
National environmental/energy workforce assessment. Phase 3: Potable water programs --- indexes to potable water education programs
[PB-298583/6] N80-11665
National environmental/energy workforce assessment, phase 3. Water/wastewater programs --- directory of courses available
[PB-298588/5] N80-11666
National environmental/energy workforce assessment, phase 3. Composite: Environmental science/health --- post-secondary educational directory
[PB-298590/1] N80-11668
National environmental/energy workforce assessment, phase 3. Composite: Environmental studies --- indexes to environment management programs
[PB-289591/9] N80-11669
National environmental/energy workforce assessment, phase 3. Noise programs --- indexes to noise pollution education programs
[PB-298581/0] N80-11671
National environmental/energy workforce assessment, phase 3. Wastewater programs --- indexes to waste water education programs
[PB-298584/4] N80-11672
National environmental/energy workforce assessment, phase 3. Radiation programs --- indexes on radiation protection education programs
[PB-298585/1] N80-11673
A manual for cataloging and indexing documents --- geothermal energy data base
[LBL-4432-REV-1] N80-11946

INDEXES [RATIOS]
The usefulness of data from mountaintop fire lookout stations in determining atmospheric stability --- determining atmospheric turbulence indexes to forecast thunderstorms
[PB-298899/6] N80-11743

INDIANA
Effects of pumping on ground-water levels near, Taylorsville, Bartholomew County, Indiana
[PB-298244/5] N80-11710

INDICATING INSTRUMENTS
Current capabilities of transient two-phase flow instruments
[CONF-790505-9] N80-11402
Laser-beam profiler and detector-surface scanner
[BDX-613-1841-REV] N80-11448

INDIUM PHOSPHIDES
Electric current controlled liquid phase epitaxy of compound semiconductors for microwave devices --- indium phosphides
[AD-A072643] N80-11923

INDUCTION HEATING
Induction heating gun
[NASA-CASE-LAR-12540-1] N80-11468
One step dual purpose joining technique
[NASA-CASE-LAR-12595-1] N80-11469

INDUSTRIAL ENERGY
Geothermal energy for industrial application
[LBL-8919] N80-11579
Energy conservation: Policy issues and end-use scenarios of savings potential. Part 3: Policy barriers and investment decisions in industry
[LBL-7896-PT-3] N80-11614

INDUSTRIAL MANAGEMENT
Energy conservation: Policy issues and end-use scenarios of savings potential. Part 3: Policy barriers and investment decisions in industry
[LBL-7896-PT-3] N80-11614

INDUSTRIAL WASTES
Metal hydroxides from electroplating sludge characterization and metal recovery
[AD-A070233] N80-11636
Energy development vs water quality in the upper Colorado and upper Missouri River Basins
[LA-7497-MS] N80-11641
Extended tests of Saffil aluminum filter media --- for hot gas cleanup
[PB-297567/0] N80-11652
Economics of disposal of lime/limestone scrubbing wastes. Sludge/flyash blending and gypsum systems
[PB-297946/6] N80-11961

INDUSTRIES
Will an increasing number of companies start making their own LSI-components? An evaluation of development trends in the electronics industry
[ECR-82] N80-11360
SEASAT demonstration experiments with the offshore oil, gas and mining industries
[NASA-CR-162423] N80-11532
Transfer of energy conservation technology to industry. A preliminary survey of existing mechanisms
[ANL/EES-TM-28] N80-11576
Preliminary assessment of industrial needs for an advanced ocean technology
[NASA-CR-162435] N80-11747

INELASTIC SCATTERING
On the computation of bounds for low energy Compton scattering parameters: Proof of a conjecture
[PM/79/7] N80-11885

INEQUALITIES
Inequalities and approximation with applications to VSTOL aircraft --- using control theory for optimal control approximations
[AD-A071807] N80-11099

INERTIAL GUIDANCE
Inertial navigation and guidance. Citations from the international aerospace abstracts data base
[NTIS/PS-79/0825/4] N80-11064

INERTIAL NAVIGATION
Inertial navigation and guidance. Citations from the international aerospace abstracts data base
[NTIS/PS-79/0825/4] N80-11064
Study to development gradiometer techniques --- filtering of gravity-gradiometer readings onboard
[AD-A072821] N80-11688

INERTIAL PLATFORMS
LIMS: Laser Inertial Measurement System
[AD-A072389] N80-11060

INFORMATION DISSEMINATION
Message services in computer networks
[AD-A071730] N80-11282
Transfer of energy conservation technology to industry. A preliminary survey of existing mechanisms
[ANL/EES-TM-28] N80-11576
Lack of accountability in Government public information and publishing programs
[GPO-45-775] N80-11943
Development of a planning guide to innovation in the dissemination of scientific information
[PB-296537/4] N80-11949

INFORMATION RETRIEVAL
Shortrange forecasting through extrapolation of satellite imagery patterns. Part 1: Motion vector techniques
[AD-A073081] N80-11726
The data banks. What they are and how they are used
N80-11823
Automated Document Retrieval Workshop
[HEDL-SA-1628] N80-11947

INFORMATION SYSTEMS
Evaluation of dais technology applied to the integrated navigation system of a tactical transport
[AD-A073068] N80-11061
A fault tolerance assessment of dais --- failure analysis in digital information systems using error functions
[AD-A072450] N80-11082
In-flight performance evaluation of experimental information
[AD-A071701] N80-11084
SCHEDULE. Managerial tool for project/product managers
[AD-A072140] N80-11257
An economic analysis of five selected LANDSAT assisted information systems in Oregon
[NASA-CR-162434] N80-11533
World Energy Data System [WENDS]
[CONF-790461-2] N80-11587
Telecommunications in medicine. A bibliography with abstracts
[NTIS/PS-79/0786/8] N80-11769
A normative cost-benefit analysis of the systematic design methodology
[AD-A072355] N80-11809
Electronics research at the University of Texas at Austin
[AD-A072436] N80-11987

INFORMATION THEORY
An experiment in distributed interpretation
[AD-A072558] N80-11792
Information theoretic approximations for M/G/1 and G/G/1 queuing systems
[AD-A072338] N80-11831

INFRARED ABSORPTION
Infrared absorption by water clusters
[AD-A071455] N80-11895

INFRARED ASTRONOMY
Space Research in the Netherlands, 1977
N80-11990

INFRARED DETECTORS
Laser deflection analysis
[AD-A072560] N80-11432
Study of temperature/moisture retrieval capabilities of DMSP/SSH sensor channels
[AD-A073144] N80-11542

INFRARED IMAGERY
Influence of coolant tube curvature on film cooling effectiveness as detected by infrared imagery
[NASA-TP-1546] N80-11087

INFRARED INTERFEROMETERS
Measurements of electron density and temperature profiles in a gas blanket experiment
[TRITA-PFU-79-03] N80-11915

INFRARED LASERS
Optically pumped far infrared lasers
[AD-A071836] N80-11434
Laser physics and laser techniques
[AD-A072009] N80-11435

INFRARED RADIATION
Studies of atmospheric infrared emissions
[AD-A072831] N80-11689

INFRARED RADIOMETERS
Comparison of spectroscopic and radiometric measurements of upper atmosphere water vapor
[PB-299072/9] N80-11713

INFRARED REFLECTION
Wide angle optical systems --- multispectral scanner
[NASA-CASE-MSC-18373-1] N80-11892

INFRARED SPECTRA
Determination of physical and chemical states of lubricants in concentrated contacts, part 1
[NASA-CR-3204] N80-11225
Infrared optical properties of bipropellant cryocontaminants
[AD-A073186] N80-11242

INHIBITORS
On-line tests of organic additives for the inhibition of the precipitation of silica from hypersaline geothermal brine. 2: Tests of nitrogen-containing compounds, silanes, and additional ethoxylated compounds
[UCID-18195] N80-11567

INPUT
SAMICS: Input data preparation --- Solar Array Manufacturing Industry Costing Standards
[NASA-CR-162421] N80-11570

INPUT/OUTPUT ROUTINES
Manned engineering flight simulation validation, part 2: Software user's guide
[AD-A071395] N80-11105
Quantitative synthesis of multiple loop feedback systems with large plant uncertainty
[AD-A072644] N80-11833
Zero base budget software
[PB-298732/9] N80-11942

INSTRUMENT ERRORS
Use of indexed sensitivity factors in the analysis of nickel and iron based alloys: Study of the decalibration of sheathed Chromel/Alumel thermocouples
[CONF-781076-1] N80-11406
Comparison of some instrumental variable methods: Consistency and accuracy aspects
[UPTEC-78-88-R] N80-11499

INSTRUMENT PACKAGES
Influence of microprocessor technology on instrument and system design
[CONF-790525-1] N80-11796

INTAKE SYSTEMS
Development efforts on a diffuser and pump inlet for a water jet propulsion system
[AD-A072567] N80-11260

INTEGRAL CALCULUS
Runge-Katta starters for multistep methods
[COO-2383-0053] N80-11391
Lie-group theory for symbolic integration of first-order differential equations: A modern treatment
[LA-UR-79-251] N80-11865

INTEGRAL EQUATIONS
Pseudosymmetric eigenmode expansion for the magnetic field integral equation and SEM consequences
[AD-A071429] N80-11297
A proposal for a nonlinear method of representation of voice signals
[FUB-33-1978] N80-11323
Noether's theory in classical nonconservative mechanics
[CSIR-TWISK-66] N80-11836
Vertex function and crossing symmetry --- quantum mechanical many body problem
[CSIR-TWISK-53] N80-11841

INTEGRATED CIRCUITS
Joint services electronics program of the Edward L. Ginzton Laboratory of Stanford University
[AD-A072766] N80-11337
Controllability/observability analysis of digital circuits --- large scale integration
[SAND-78-1895] N80-11352
One shots and alternatives in synchronous digital system design --- undesirable features of monostable multivibrators
[LBL-8722] N80-11353
Development of integrated thermionic circuits for geothermal high-temperature applications
[LA-UR-79-723] N80-11592

INTEGRATED ENERGY SYSTEMS
Heat pump centered integrated community energy systems: System development
[ANL/ICES-TM-27] N80-11571
Heat pump centered integrated community energy systems; System development
[ANL-ICES-TM-28] N80-11574
Regional reference energy systems: Electric utility applications
[BNL-50962] N80-11585
DOE heat pump centered integrated community energy systems project
[CONF-790362-1] N80-11586

INTELLIGENCE
Intelligence as an information processing concept
[AD-A069953] N80-11775

INTELLIGIBILITY
The rhymed words method of measuring the intelligibility index in audiometric work. The influence of open and closed vowels
[FUB-1-1979] N80-11324

INTERCEPTION
A model for estimating radiowave acquisition receiving system intercept probability
[AD-A072503] N80-11304

INTERFEROMETERS
Design of a high precision dilatometer using laser interferometry
[SAND-78-1796] N80-11407

INTERFEROMETRY
Effect of multiaxial loading on crack growth. Volume 3: Compilation of interferometry photographs
[AD-A072074] N80-11512

INTERMETALLICS
Investigations of intermetallic alloy hydriding mechanism
[ORO-5246-3] N80-11202
INTERMODULATION
An experimental investigation of the reduction of nonlinear effects using passive compensating networks
[AD-A072422] N80-11284
INTERNAL COMBUSTION ENGINES
Nonisenthalpic interaction of a planar premixed laminar flame with a parallel end wall
[AD-A071858] N80-11160
A comparison of five methods for calculating the exhaust flow from internal combustion engines
N80-11482
Exhaust flow simulation fo a one cylinder engine with a divergent exhaust pipe
N80-11483
INTERNAL WAVES
Acoustic phase fluctuations caused by Garrett-Munk internal waves
[AD-A071354] N80-11872
INTERNATIONAL COOPERATION
World Weather Watch: Consolidated report on the Voluntary Assistance Programme including projects approved for circulation in 1978
[WMO-525] N80-11732
Space research in Sweden, 1978
N80-11993
INTERNATIONAL SUN EARTH EXPLORER 2
A spectrometer for detecting charged particles of medium energies: Experiment KED-ISEE
[BMFT-FB-W-78-19] N80-11410
INTERPLANETARY MAGNETIC FIELDS
Connections between comets and plasmas in space
N80-11974
INTERSTELLAR GAS
Comets, carbonaceous chondrites, and interstellar clouds: Condensation of carbon
N80-11976
INTERSTELLAR MATTER
Comets: Cosmic connections with carbonaceous meteorites, interstellar molecules and the origin of life
N80-11975
INVERTEBRATES
Reconnaissance survey of the distribution and abundance of benthic organisms in the New York Bight Apex 5-14 June 1973
[PB-297333/7] N80-11552
ION DISTRIBUTION
Specific spacecraft evaluation: Special report --- charged particle transport from a mercury ion thruster to spacecraft surfaces
[NASA-CR-159420] N80-11137
ION ENGINES
Heat pipe cooling of power processing magnetics
[NASA-TM-79270] N80-11327
Ion propulsion and Comet Halley rendezvous
N80-11979
ION EXCHANGING
Surface reactions of oxides of sulfur
[PB-297410/3] N80-11183
ION IMPLANTATION
Implanted and annealed alloys in physical metallurgy
[SAND-78-1638C] N80-11204
ION PROPULSION
Ion propulsion and Comet Halley rendezvous
N80-11979
IONIC REACTIONS
Molecular beam studies of ion-molecule reactions
[COO-2640-8] N80-11883
IONOSONDES
Aeronautical sounding rocket program: Results of ground-based short wave absorption measurements performed at 38 deg northern latitude between 1967 and 1976
[BMFT-FB-W-78-22] N80-11704
IONOSPHERIC COMPOSITION
Space research in Belgium, 1978
N80-11997
IONOSPHERIC DISTURBANCES
Coordinated data analysis of ONR-118 data --- ionospheric scintillation and disturbance phenomena
[AD-A073113] N80-11690
The effect of the magnetosphere processes on the ionosphere during the magnetic storm of December 1, 1977 based on the Cosmos-900 data
[D-277] N80-11709
IONOSPHERIC ELECTRON DENSITY
Correlation studies of protonospheric electron content over the US continent --- using ATS 6 transmissions
[AD-A073080] N80-11686
Coordinated data analysis of ONR-118 data --- ionospheric scintillation and disturbance phenomena
[AD-A073113] N80-11690
IONOSPHERIC PROPAGATION
Aeronautical sounding rocket program: Results of ground-based short wave absorption measurements performed at 38 deg northern latitude between 1967 and 1976
[BMFT-FB-W-78-22] N80-11704
IPAD
Application of IPAD to missile design
[NASA-CR-132671] N80-11120
IRON ALLOYS
Use of indexed sensitivity factors in the analysis of nickel and iron based alloys: Study of the decalibration of sheathed Chromel/Alumel thermocouples
[CONF-781076-1] N80-11406
IRRADIANCE
Laser irradiance in the sea: Theory and experiment
[AD-A072601] N80-11430
IRRIGATION
A history of land application as a treatment alternative
[PB-298227/0] N80-11964
ISOTOPE SEPARATION
Isotope separation by laser-induced photomigration --- boron chlorides
[LA-TR-78-36] N80-11882
ISOTOPES
High precision metal stable isotope ratio measurements using volatile metal chelates
[CONF-780501-7] N80-11211
ISOTROPIC TURBULENCE
Noise of a model helicopter rotor due to ingestion of turbulence
[NASA-CR-3213] N80-11067
ITERATION
The analysis of wing-body combinations at moderate angles of attack --- missile bodies
[AD-A074284] N80-11040
ITERATIVE SOLUTION
On the numerical solution of Cauchy integrals
N80-11853

J

JET AIRCRAFT
Evaluation of dais technology applied to the integrated navigation system of a tactical transport
[AD-A073068] N80-11061
Wind shear hazard definition for a wide body jet --- low level wind shear and control simulation
[FAA-RD-79-90] N80-11715
JET AIRCRAFT NOISE
A method for predicting the noise levels of coannular jets with inverted velocity profiles
[NASA-CR-3176] N80-11868
JET ENGINE FUELS
Behavior of lightly confined high explosives in a jet-fuel fire
[UCRL-52659] N80-11247
JET EXHAUST
Flight-measured afterbody pressure coefficients from an airplane having twin side-by-side jet engines for Mach numbers from 0.6 to 1.6
[NASA-TP-1549] N80-11035
JET FLOW
Aerodynamic interactions from reaction controls for lateral control of the M2-F2 lifting-body entry configuration at transonic and supersonic and supersonic Mach numbers --- wind tunnel tests
[NASA-TM-78534] N80-11033
A study of coherent structures in axisymmetric jets using an optical technique
[AASU-341] N80-11399
A computational model for three-dimensional incompressible wall jets with large cross flow
[AD-A071689] N80-11495
JET MIXING FLOW
A method for the measurement of mixing properties in a turbulent jet flow
[VKI-TN-130] N80-11398
Effect of vertical scale distortion on the temperature field of a thermal-hydraulic model
[PB-297274/3] N80-11551
JET PROPULSION
Development efforts on a diffuser and pump inlet for a water jet propulsion system
[AD-A072567] N80-11260
JET PUMPS
Development efforts on a diffuser and pump inlet for a water jet propulsion system
[AD-A072567] N80-11260
JET THRUST
Aerodynamic interactions from reaction controls for lateral control of the M2-F2 lifting-body entry configuration at transonic and supersonic and supersonic Mach numbers --- wind tunnel tests
[NASA-TM-78534] N80-11033
JOINTS [JUNCTIONS]
Design of the Spar-Wingskin Joint
[AD-A072426] N80-11072
Engineering design handbook: Joining of advanced composites
[AD-A072362] N80-11148
JOSEPHSON JUNCTIONS
Noise and optimization of the dc SQUID
[LBL-8510] N80-11345
JUNCTION TRANSISTORS
Unconventional circuits for static voltage transformers
[BMFT-FB-T-78-26] N80-11368
JUPITER ATMOSPHERE
Transport properties for ablation products: An illustration using the He-C2h interaction --- jouian atmosphere
N80-11373

Effects of precursor heating on radiative and chemically reacting viscous flow around a Jovian entry body
[NASA-CR-3186] N80-11375

K

KALMAN FILTERS
On-line structural response analysis: Using the extended Kalman estimator/identifier
[UCID-18175] N80-11516
Study to development gradiometer techniques --- filtering of gravity-gradiometer readings onboard
[AD-A072821] N80-11688
KEVLAR [TRADEMARK]
Hygrothermal effects on the mechanical response of Kelvar 49/epoxy laminates
[SAND-78-1362C] N80-11154
Stress-rupture life of Kevlar/epoxy spherical pressure vessels
[UCID-17755-PT-3] N80-11515
KINETIC ENERGY
Kinetic studies of gas mixtures and their application to gas lasers and pollutant detection
[CONF-781113-6] N80-11637
KRYPTON FLUORIDE LASERS
Advanced lasers for fusion applications --- krypton fluoride laser applications for fusion reactors
[UCRL-81940] N80-11442

L

LABORATORY EQUIPMENT
Laboratory coal gasifier facility
[UCRL-82602] N80-11245
LAGRANGE MULTIPLIERS
Augmented restricted Lagrangians in convex programming
[CSIR-TWISK-62] N80-11802
LAMINAR BOUNDARY LAYER
Generation rate of turbulent patches in the laminar boundary layer of a submersible
[AD-A071796] N80-11380
LAMINAR FLOW
Nonisenthalpic interaction of a planar premixed laminar flame with a parallel end wall
[AD-A071858] N80-11160
Further observations on transition in a pipe
[AD-A071909] N80-11378
LAMINAR HEAT TRANSFER
The effect of pressure gradient and external turbulence on heat transfer to a cold flat plate
[VKI-TN-128] N80-11396
LAMINATES
Development and fabrication of bismaleimide-graphite composites
[NASA-CR-152324] N80-11141
Micromechanics of intraply hybrid composites: Elastic and thermal properties
[NASA-TM-79253] N80-11143
Dynamic response of damaged anglephied fiber composites
[NASA-TM-79281] N80-11145
Development of a realistic stress analysis for fatigue analysis of notched composite laminates
[NASA-CR-159119] N80-11146
Classical analyses of laminated bimodulus composite-material plates
[AD-A072276] N80-11147
Coating laminated substrates
[BDX-613-2062-REV] N80-11153
Exploratory research on novel ambient temperature curing techniques for adhesives, sealants and laminates
[AD-A072591] N80-11227
A multilayer traction-free edge, quadrilateral, warping element for the stress analysis of composite plates and shells
[AD-A071910] N80-11508
LAND MANAGEMENT
Institutional constraints on land management for water resource protection in urban and suburban watersheds
[PB-298271/8] N80-11549
LAND USE
Land cover classification from Landsat data: Phase 3 of a joint DOE/NASA demonstration
[AD-A071723] N80-11535
Study in remote sensing for land use
[AD-A071802] N80-11537
Simulation of land-use patterns affecting the global carbon cycle
[ORNL/TM-6651] N80-11701
LANDAU FACTOR
Single-electron capture into Ar + excited states in ar + Na collision below 12 keV. 2: Relative population distributed in Ar + excited states
[IPPJ-411] N80-11876
LANDSAT SATELLITES
An economic analysis of five selected LANDSAT assisted information systems in Oregon
[NASA-CR-162434] N80-11533
Land cover classification from Landsat data: Phase 3 of a joint DOE/NASA demonstration
[AD-A071723] N80-11535

Study in remote sensing for land use
[AD-A071802] N80-11537
LANDSAT 1
Automated earth resources surveys using satellite and aircraft scanner data: A Finnish approach
[VTT-LU-15] N80-11547
LARGE SCALE INTEGRATION
Controllability/observability analysis of digital circuits --- large scale integration
[SAND-78-1895] N80-11352
Will an increasing number of companies start making their own LSI-components? An evaluation of development trends in the electronics industry
[ECR-82] N80-11360
LARGE SPACE STRUCTURES
Electron and proton absorption calculations for a graphite/epoxy composite model --- large space structures
[NASA-TP-1568] N80-11226
LARVAE
Environmental studies of the south Texas outer continental shelf, 1977. Ichthyoplankton/Mackerel Eggs and larvae
[PB-296647/1] N80-11753
LASER ANEMOMETERS
Measurements of turbulence parameters in a rocket engine exhaust using a laser crossed beam correlation technique
[AASU-340] N80-11140
LASER APPLICATIONS
LIMS: Laser Inertial Measurement System
[AD-A072389] N80-11060
A study of coherent structures in axisymmetric jets using an optical technique
[AASU-341] N80-11399
Advanced lasers for fusion applications --- krypton fluoride laser applications for fusion reactors
[UCRL-81940] N80-11442
Lasers in machine tool controls
[Y/DA-8211] N80-11444
Flourescence diagnostics in two-step laser excitation of high J atoms
[UCRL-81746] N80-11449
Characteristics of laser cutting Kevlar laminates
[BDX-613-2075-REV] N80-11456
Laser scanning camera
[TDB-324] N80-11457
Gallium arsenide lasers. Citations from the international aerospace abstracts data base
[NTIS/PS-79/0821/3] N80-11458
Laser cutting and machining: Metals. Citations from the engineering index data base
[NTIS/PS-79/0890/8] N80-11459
Dye lasers. Citations from the international aerospace abstracts data base
[NTIS/PS-79/0823/9] N80-11460
Neodymium YAG lasers. Citations from the international aerospace abstracts data base
[NTIS/PS-79/0862/7] N80-11461
Laser cutting and machining: Nonmetals. Citations from the Engineering Index data base --- bibliography with abstracts
[NTIS/PS-79/0891/6] N80-11464
LASER FUSION
Advanced lasers for fusion applications --- krypton fluoride laser applications for fusion reactors
[UCRL-81940] N80-11442
LASER OUTPUTS
Appendix B: Lasers of potential use for shuttle lidar
N80-11426
Appendix C: Transmitting and receiving optics considerations
N80-11427
Laser-beam profiler and detector-surface scanner
[BDX-613-1841-REV] N80-11448
Radial electron beam laser excitation: The REBLE report
[SAND-78-2005] N80-11450
Ultraviolet lasers. Citations from the international aerospace abstracts data base
[NTIS/PS-79/0861/9] N80-11462
LASER PUMPING
Optically pumped far infrared lasers
[AD-A071836] N80-11434
Laser physics and laser techniques
[AD-A072009] N80-11435
Compilation of data relevant to nuclear pumped lasers, volume 1
[AD-A071360] N80-11437
LASER RANGER/TRACKER
Space Research in the Netherlands, 1977
N80-11990
LASER TARGET DESIGNATORS
Laser induced luminescence of military targets
[AD-A073200] N80-11441
LASER TARGETS
Ten point six micron laser target designator
[AD-A071912] N80-11429
LASER WELDING
Laser welding of electrical interconnections
[BDX-613-2022-REV] N80-11356
Development of laser welding techniques for joining armor
[AD-A072537] N80-11472
Development of laser welding techniques for joining armor
[AD-A072536] N80-11473
LASERS
Laser irradiance in the sea: Theory and experiment
[AD-A072601] N80-11430
Design of an experimental program for evaluation of LBR systems
[AD-A071526] N80-11433
Optical and discharge studies of novel electronic transistion laser species
[AD-A071853] N80-11439
Free electron laser and its possible developments
[BNL-25857] N80-11445
Laser induced fluorescence extension to non-fluorescent materials
[UCRL-81837] N80-11454
Laser induced damage in fluoride glasses: A status report
[UCRL-81358] N80-11455
Radiation effects in optical emitters and receivers
[SAND-78-1798] N80-11899
LASING
Isotope separation by laser-induced photomigration --- boron chlorides
[LA-TR-78-36] N80-11882
LATE STARS
Photometric properties of G, K and M stars in relation to galatic structure and evolution
[PUBL-SER-B-FASC-5] N80-11969
LATERAL CONTROL
Aerodynamic interactions from reaction controls for lateral control of the M2-F2 lifting-body entry configuration at transonic and supersonic and supersonic Mach numbers --- wind tunnel tests
[NASA-TM-78534] N80-11033
LATERAL STABILITY
The response of a turbulent boundary layer to lateral divergence
[IC-AERO-78-03] N80-11394
LATTICES [MATHEMATICS]
Differential difference evolution equations. Part 2: Darboux transformation for the Toda lattice
[PM/79/11] N80-11932
LAW [JURISPRUDENCE]
A history of land application as a treatment alternative
[PB-298227/0] N80-11964
LEAD [METAL]
Elipsometry of surface layers on lead and lithium
[LBL-8375] N80-11926
LEADING EDGES
Leading edge vortex-flap experiments on a 74 deg delta wing
[NASA-CR-159161] N80-11038
Measurements on a three-dimensional swept wing at low speeds. Part 1: The flow around the leading edge
[FFA-130-PT-1] N80-11044
LEARNING
Heuristics for knowledge acquisition from maps
[AD-A073126] N80-11540
Cognitive styles: A review of the literature
[AD-A069435] N80-11772
Microfiche applications in an individualized, self-paced learning system
[AD-A069445] N80-11945
LEARNING THEORY
Microfiche applications in an individualized, self-paced learning system
[AD-A069445] N80-11945
LEAST SQUARES METHOD
Method of moments as the least squares solution for fitting a polynomial
[AD-A072357] N80-11845
LENGTH
On the lengths of the pieces of a stick broken at random
[CTH-MATH-1979-13] N80-11860
LIE GROUPS
Lie-group theory for symbolic integration of first-order differential equations: A modern treatment
[LA-UR-79-251] N80-11865
LIFE [DURABILITY]
Shelf life determination of epoxy prepregs and film adhesives
[BDX-613-2033-REV] N80-11233
LIFE RAFTS
Life raft study, February 1978
[AD-A073055] N80-11056
LIFE SCIENCES
Comets: Cosmic connections with carbonaceous meteorites, interstellar molecules and the origin of life
N80-11975
LIFT
Overall aerodynamic characteristics of caret and delta wings at supersonic speeds
N80-11022
LIFT DRAG RATIO
Overall aerodynamic characteristics of caret and delta wings at supersonic speeds
N80-11022
LIGHT [VISIBLE RADIATION]
Spectral radiometric measurement and analysis program. Volume 3: Data analysis and formulation of the model
[AD-A072080] N80-11721
LIGHT AIRCRAFT
New aircraft technology: Report on the Farnborough International Air Show
[PB-298345/0] N80-11078
Light airplane crash tests at three pitch angles
[NASA-TP-1481] N80-11505
LIGHT EMISSION
Direct photon emission in positron electron annihilation processes
[PM/79/9] N80-11887
LIGHT EMITTING DIODES
A comparative 5000 hours life test of light emitting diode displays, including 22 variants from 10 manufacturers
[ECR-86] N80-11370
Radiation effects in optical emitters and receivers
[SAND-78-1798] N80-11899
LIGHT TRANSMISSION
Investigation of a multimode fiber optic coupler
[AD-A071874] N80-11896
LIGHT WATER BREEDER REACTORS
MDSFP: A computer program for elastic solution of three dimensional structures by the finite element method [LWBR development program]
[WAPD-TM-1187] N80-11816
LIGHTNING
Global lightning distribution at dawn and dusk for August-December 1977 as observed by the DMSD lighting detector
[AD-A071896] N80-11678
LIMESTONE
Economics of disposal of lime/limestone scrubbing wastes: Sludge/flyash blending and gypsum systems
[PB-297946/6] N80-11961
LIMITS [MATHEMATICS]
On the lengths of the pieces of a stick broken at random
[CTH-MATH-1979-13] N80-11860
LINE SPECTRA
Method of calculating H2O transmission between 333 and 633 cm-1
[AD-A072850] N80-11683
An emission-line survey of the Milky Way
[NASA-SP-434] N80-11966
LINEAR ENERGY TRANSFER [LET]
Discrete multivariate analysis on radiobiological results from the biostack 3 Bacillus subtilis experiment
N80-11759
LINEAR EQUATIONS
Investigation of linear transformations for automatic cartographic analysis
[AD-A071752] N80-11536
Observability with conic observation set
[CSIR-TWISK-59] N80-11838
LINEAR PROGRAMMING
On the limit state of a toroidal shell of revolution under axisymmetric deformation
N80-11015
Linear systems analysis program, L224[QR]. Volume 2: Supplemental system design and maintenance document
[NASA-CR-2862] N80-11098
FORTRAN subroutines for M estimators in the linear model
[AD-A071744] N80-11815
LINEAR SYSTEMS
Optimal object control with worst random parameter distribution
N80-11016
Linear systems analysis program, L224[QR]. Volume 2: Supplemental system design and maintenance document
[NASA-CR-2862] N80-11098
Some methods for identification of linear systems with noisy input output data
[UPTEC-78-73-R] N80-11315
Analysis and Design of a phase linearization system for traveling wave tube amplifiers
[CNES-NT-86] N80-11362
Minimum l-p-norm controls for time-varying linear dynamic systems
[CSIR-TWISK-49] N80-11828
Differential difference evolution equations. Part 2: Darboux transformation for the Toda lattice
[PM/79/11] N80-11932
LINES [GEOMETRY]
Preprocessing of PHERMEX flash radiographic images with Haar and adaptive filtering --- enhancement of lines and/or edges
[LA-7561-MS] N80-11404
LIQUEFACTION
Economic of hydrogen production and liquefaction updated to 1980
[NASA-CR-159163] N80-11238
LIQUID CHROMATOGRAPHY
HPLC monitoring of graphite-epoxy prepreg aging
[AD-A072294] N80-11150
Chromatography of metal ions with a triazine chelating resin
[IS-T-855] N80-11167
LIQUID FILLED SHELLS
On the limit state of a toroidal shell of revolution under axisymmetric deformation
N80-11015
LIQUID HYDROGEN
Economic of hydrogen production and liquefaction updated to 1980
[NASA-CR-159163] N80-11238
LIQUID PHASES
Numerical deconvolution of photoelectron spectra of liquids
[AD-A073087] N80-11164

Analysis of backmixing and mass transfer in solvent extraction columns
[IS-T-851] N80-11166
Electric current controlled liquid phase epitaxy of compound semiconductors for microwave devices --- indium phosphides
[AD-A072643] N80-11923

LIQUID ROCKET PROPELLANTS
Infrared optical properties of bipropellant cryocontaminants
[AD-A073186] N80-11242

LIQUID-SOLID INTERFACES
Analysis of the influence of space conditions upon reactions between liquid as well as gaseous corrosive agents and metals
[BMFT-FB-W-77-10] N80-11222
Desorption heat capacity of 3He adsorbed on solid argon
[UPTEC-78-16-R] N80-11264
Desorption heat capacity of 4He adsorbed on solid neon
[UPTEC-78-17-R] N80-11265
Heat capacity of submonolayers of 3He adsorbed on solid neon
[UPTEC-78-31-R] N80-11267

LISP [PROGRAMMING LANGUAGE]
An interactive framework for design automation
[UPTEC-78-47-R] N80-11821

LITHIUM
Elipsometry of surface layers on lead and lithium
[LBL-8375] N80-11926

LITHIUM CHLORIDES
Lithium-thionyl chloride battery
[AD-A072358] N80-11568

LITHIUM SULFUR BATTERIES
Lithium-thionyl chloride battery
[AD-A072358] N80-11568

LOAD DISTRIBUTION [FORCES]
Load-carrying ability of cylindrical shell loaded by concentrated force acting along the generator
N80-11017

LOAD TESTS
Flight simulation fatigue crack propagation evaluation of candidate lower wing skin materials with particular consideration of spectrum truncation
[NLR-TR-77092-U] N80-11524

LOADS [FORCES]
Determination of loads and stress in composite material layers for a plate in the plane stress state
N80-11023
Analysis and synthesis of operational loads
[RAE-LIB-TRANS-2008] N80-11504

LONG TERM EFFECTS
Shelf life determination of epoxy prepregs and film adhesives
[BDX-613-2033-REV] N80-11233
Long-term instability problems in adaptive noise-cancelers
[SAND-78-1032] N80-11311

LOUDNESS
Interstimulus interval as it affects temporary threshold shift in serial presentations of loud tones
[AD-A072006] N80-11762

LOW ASPECT RATIO
Experimental study of low aspect ratio compressor blading
[NASA-TM-79280] N80-11037

LOW CONCENTRATIONS
Tertiary oil recovery processes research at the University of Texas
[BETC-0001-1] N80-11544

LOW COST
1/3 band low-cost crossed-field amplifier
[AD-A072311] N80-11330

LOW DENSITY MATERIALS
Characterization of low density rigid urethane foam
[BDX-613-1890-REV] N80-11232

LOW FREQUENCIES
Fiber optic detection of low frequency underwater sound
[AD-A072829] N80-11898

LOW SPEED WIND TUNNELS
Measurements on a three-dimensional swept wing at low speeds. Part 1: The flow around the leading edge
[FFA-130-PT-1] N80-11044
Measurements on a three-dimensional swept wing at low speeds. Part 2: The flow in the boundary layer on the main wing
[FFA-131-PT-2] N80-11045

LOW TEMPERATURE
Low temperature heat capacity studies on hydrogen absorbing intermetallic compounds
[IS-M-210] N80-11203
Further measurements of the specific heats at low temperatures in metallic glasses
[UCRL-13908] N80-11231
Description of experimental techniques used in heat capacity measurements of adsorbed helium
[UPTEC-78-18-R] N80-11266

LOW TEMPERATURE ENVIRONMENTS
Systems analysis of arctic fuels dispensing equipment
[AD-A071815] N80-11106

LOW TEMPERATURE TESTS
Systems analysis of arctic fuels dispensing equipment
[AD-A071815] N80-11106
Thermal expansion of glasses at low temperatures --- fused silica and polymethyl methacrylate
[IS-T-829] N80-11234

LUBRICANTS
Determination of physical and chemical states of lubricants in concentrated contacts, part 1
[NASA-CR-3204] N80-11225

LUMINANCE
Helmet-mounted displays: An experimental investigation of display luminance and contrast
[AD-A072059] N80-11783

LUMINESCENCE
X-ray excited optical luminescence of polynuclear aromatic hydrocarbons
[IS-T-856] N80-11165
Laser induced luminescence of military targets
[AD-A073200] N80-11441

LUMINOUS INTENSITY
Laser-beam profiler and detector-surface scanner
[BDX-613-1841-REV] N80-11448

LUNAR EXPLORATION
Space research in the United Kingdom
N80-11998

LUNAR GEOLOGY
Space research in Switzerland, 1978
N80-11995

M

M-2F2 LIFTING BODY
Aerodynamic interactions from reaction controls for lateral control of the M2-F2 lifting-body entry configuration at transonic and supersonic and supersonic Mach numbers --- wind tunnel tests
[NASA-TM-78534] N80-11033

MACH NUMBER
Flight-measured afterbody pressure coefficients from an airplane having twin side-by-side jet engines for Mach numbers from 0.6 to 1.6
[NASA-TP-1549] N80-11035

MACHINE TOOLS
Lasers in machine tool controls
[Y/DA-8211] N80-11444

MACHINERY
Proceedings of the 28th Meeting of the Mechanical prevention group. Report on MFPG detection, diagnosis, and prognosis
[NASA-TM-80881] N80-11502

MACHINING
Laser cutting and machining: Metals. Citations from the engineering index data base
[NTIS/PS-79/0890/8] N80-11459

MAGNETIC ANOMALIES
Magnetic anomaly in superconducting TmRa4B4
[LA-UR-78-2701] N80-11347

MAGNETIC FIELD CONFIGURATIONS
Continuous double adiabatic spectrum in a plasma confined in a poloidal magnetic field
[TRITA-PFU-79-02] N80-11914

MAGNETIC FIELDS
Pseudosymmetric eigenmode expansion for the magnetic field integral equation and SEM consequences
[AD-A071429] N80-11297
Formulation of electromagnetic pulse external interaction above a lossy earth
[AD-A071327] N80-11298
On the boundary layer between a flowing plasma and a magnetic field. Part 1. The conditions for equilibrium
[CRPE-NT-63-PT-1] N80-11921

MAGNETIC INDUCTION
Electric and magnetic fields of an intense pulse of relativistic electrons propagating through air
[AD-A071621] N80-11332

MAGNETIC MATERIALS
Activities of the Department of Solid State Physics
[UPTEC-78-08-R] N80-11931

MAGNETIC MIRRORS
Magnetic mirror fusion research at the Lawrence Livermore Laboratory
[UCRL-82318] N80-11908
Stability of field reversed mirrors
[COO-2218-119] N80-11910

MAGNETIC PROPERTIES
Activities of the Department of Solid State Physics
[UPTEC-78-08-R] N80-11931

MAGNETIC STORMS
A dynamical model for the onset of magnetospheric substorms
[AD-A072987] N80-11695
The effect of the magnetosphere processes on the ionosphere during the magnetic storm of December 1, 1977 based on the Cosmos-900 data
[D-277] N80-11709

MAGNETIC SUSPENSION
Experimental feasibility study of the application of magnetic suspension techniques to large-scale aerodynamic test facilities --- cryogenic traonics wind tunnel
[NASA-CR-146761] N80-11102
Preliminary investigations of design philosophies and features applicable to large magnetic suspension and balance systems
[NASA-CR-162433] N80-11104

MAGNETOHYDRODYNAMIC FLOW
Effects of gas plasma on printed circuit board materials
[BDX-613-2030-REV] N80-11357
Connections between comets and plasmas in space
N80-11974

MAGNETOHYDRODYNAMIC STABILITY
Relaxation of Z discharge between electrodes --- using Taylor series to find final relaxation of zeta pinch magnetohydrodynamic stability
[IPPJ-414] N80-11903
Magnetic mirror fusion research at the Lawrence Livermore Laboratory
[UCRL-82318] N80-11908
Stability theory for internal ring configurations
[LA-7618-MS] N80-11909
Density fluctuations in a plasma chamber
[BMFT-FB-W-77-48] N80-11913
On the existence and stability of trapped Langmuir modes in a double layer
[UPTEC-78-89-R] N80-11918
On the boundary layer between a flowing plasma and a magnetic field. Part 1. The conditions for equilibrium
[CRPE-NT-63-PT-1] N80-11921

MAGNETOHYDRODYNAMICS
Non-neutral field-aligned current sheet and auroral electric field
[AD-A072852] N80-11687
Progress in RINGBOOK 2, TORTUR 2 and SPICA 2 for 1978
N80-11920

MAGNETOMETERS
Design and operation of the search-coil magnetometer experiment on the solar probe HELIOS
[BMFT-FB-W-77-25] N80-11129

MAGNETOSPHERE
Scientific objective 7: Magnetospheric sun and weather relationships
N80-11422
Coordinated data analysis of ONR-118 data --- ionospheric scintillation and disturbance phenomena
[AD-A073113] N80-11690
A dynamical model for the onset of magnetospheric substorms
[AD-A072987] N80-11695
The effect of the magnetosphere processes on the ionosphere during the magnetic storm of December 1, 1977 based on the Cosmos-900 data
[D-277] N80-11709
On the boundary layer between a flowing plasma and a magnetic field. Part 1. The conditions for equilibrium
[CRPE-NT-63-PT-1] N80-11921

MAGNETOSTRICTION
The equivalent circuit in the mobility analogy of a magnetostrictive transducer in the presence of eddy currents
[AD-A072879] N80-11336

MAINTENANCE
Opportunistic Maintenance Engine Simulation model: OMENS 2
[AD-A072516] N80-11088

MALFUNCTIONS
System reliability and component costs. A correlation of component quality, failure rate, and redundancy parameters
[ECR-79] N80-11498

MAN ENVIRONMENT INTERACTIONS
Meteorology and the human environment
[WMO-577] N80-11643

MAN MACHINE SYSTEMS
Application of IPAD to missile design
[NASA-CR-132671] N80-11120
Categorization and specification requirements for a common family of AUTODIN terminals
[AD-A072164] N80-11287
Linear state feedback control of rigid-link manipulators
[UTIAS-TN-214] N80-11779
Integrated helmet-mounted sight/display program: Coating technology
[AD-A072060] N80-11782
Helmet-mounted displays: A computer-assisted analysis of day-night visual requirements
[AD-A072061] N80-11784
The role of the upper field of view in selected HMS/D visual tasks
[AD-A072064] N80-11785
Operational pilot factors analysis report
[AD-A072063] N80-11787
Head aiming/tracking accuracy in a helicopter environment
[AD-A071359] N80-11788
Study of automated command support systems
[AD-A072298] N80-11790
An interactive framework for design automation
[UPTEC-78-47-R] N80-11821

MANAGEMENT INFORMATION SYSTEMS
Automated Document Retrieval Workshop
[HEDL-SA-1628] N80-11947
Development of a planning guide to innovation in the dissemination of scientific information
[PB-296537/4] N80-11949

MANAGEMENT METHODS
Aircrew displays and avionics for application in a future national airspace system
[NASA-TM-80095] N80-11052
SCHEDULE. Managerial tool for project/product managers
[AD-A072140] N80-11257

National environmental/energy workforce assessment, phase 3. Solid waste programs — indexes for solid wastes management education
[PB-298566/9] N80-11640
Aspects of a multi-criterion secretary problem
[CSIR-TWISK-42] N80-11835

MANAGEMENT PLANNING
Evaluation criteria for commercially oriented materials processing in space proposals
[NASA-CR-162417] N80-11112
U. S. Army metrication analysis and recommendations for DA implementation plan, volume 1
[AD-A069746] N80-11256
Interactive water resources planning using computer graphics
[PB-297994/6] N80-11550
Zero base budget software
[PB-298732/9] N80-11942

MANAGEMENT SYSTEMS
Perspectives on intergovernmental policy and fiscal relations — study of financial management system
[PB-297280/0] N80-11952

MANIFOLDS [MATHEMATICS]
Phase space coordinates of long lifetime trapped radiation from Stoermer Mapping
[AD-A072995] N80-11694

MANNED SPACE FLIGHT
Summary of radiobiological findings. From spaceflight to ground-based studies
N80-11768

MANUALS
Janus neodymium glass laser operations manual
[UCID-17952] N80-11453

MANUFACTURING
The automated array assembly task of the low-cost silicon solar array project, phase 2
[NASA-CR-162429] N80-11562
Phase 2 of the array automated assembly task for the low cost silicon solar array project
[NASA-CR-162426] N80-11565

MAPPING
Investigation of linear transformations for automatic cartographic analysis
[AD-A071752] N80-11536
Investigations of the use of conventional films in the ETL cartographic EBR
[AD-A072628] N80-11539
Phase space coordinates of long lifetime trapped radiation from Stoermer Mapping
[AD-A072995] N80-11694
Computer mapping software at the Lawrence Berkeley Laboratory
[LBL-7938] N80-11818

MAPS
Heuristics for knowledge acquisition from maps
[AD-A071126] N80-11540

MARINE BIOLOGY
Reconnaissance survey of the distribution and abundance of benthic organisms in the New York Bight Apex 5-14 June 1973
[PB-297333/7] N80-11552
A field study of the relationship between heavy metal concentrations in stream water and selected benthic macroinvertebrate species
[PB-297284/2] N80-11651
Environmental studies of the South Texas continental shelf, 1976 - 1977. Historical zooplankton
[PB-296646/3] N80-11754

MARINE ENVIRONMENTS
OTEC thermal resource report for western coast Mexico — climate and oceanographic parameters
[HCP/T2898] N80-11600
Sampling and analysis of the aquatic environment in POTW's and their vicinity
[PB-297606/6] N80-11963

MARINE METEOROLOGY
Mariners weather log, volume 23, number 3
[PB-298738/6] N80-11741
The depth of the marine layer at San Diego as related to subsequent cool season precipitation episodes in Arizona
[PB-298817/3] N80-11742
Numerical case studies for oceanic thermal anomalies with a dynamic model
[AD-A072587] N80-11748
Physical oceanography program
[AD-A073115] N80-11750

MARINE PROPULSION
Development efforts on a diffuser and pump inlet for a water jet propulsion system
[AD-A072567] N80-11260

MARINE TECHNOLOGY
Preliminary assessment of industrial needs for an advanced ocean technology
[NASA-CR-162435] N80-11747

MARITIME SATELLITES
Concept for a worldwide civil maritime satellite communication network [MARSAT]. Operation system study
[BMFT-FB-W-77-11] N80-11313

MARKET RESEARCH
Will an increasing number of companies start making their own LSI-components? An evaluation of development trends in the electronics industry
[ECR-82] N80-11360
Preliminary assessment of industrial needs for an advanced ocean technology
[NASA-CR-162435] N80-11747

MARKOV PROCESSES
Measure-valued processes in the control of partially-observable Stochastic systems
[AD-A072070] N80-11830

MARTENSITIC STAINLESS STEELS
On the influence of nickle on toughness and ductile-brittle transition in low-carbon lath martensite steels
[UPTEC-78-53-R] N80-11223

MASERS
Rigorous derivation of general dispersion relationship for gyrotron
[AD-A072005] N80-11438

MASS SPECTROMETERS
A spectrometer for detecting charged particles of medium energies. Experiment KED-ISEE
[BMFT-FB-W-78-19] N80-11410

MASS SPECTROSCOPY
Photo ion mass spectrometry and photoelectron spectroscopy of high temperature vapors
[CONF-78[41-4] N80-11174
An EPA manual for organics analysis using gas chromatography-mass spectrometry
[PB-297164/8] N80-11182

MASS TRANSFER
Analysis of backmixing and mass transfer in solvent extraction columns
[IS-T-851] N80-11166

MATERIALS
Structural related research — physicochemical and mechanical properties of materials
[AD-A071418] N80-11988

MATERIALS SCIENCE
Report on Finnish technological activities
N80-11991

MATHEMATICAL MODELS
Analytic design of regulators for variable-parameter systems
N80-11020
New computational models in continuum mechanics
[AD-A071418] N80-11041
Titanium combustion research program and user's manual for deck CCD 1152-0.0
[AD-A072529] N80-11161
Lectures on combustion theory
[COO-3077-153] N80-11170
Rheology of concentrated suspensions
N80-11178
A model for nonlinear creep of concrete
[ISD-REPT-246] N80-11263
Comparisons of RETRAN and two-velocity two-phase flow models with experimental data
[EPRI-NP-928] N80-11392
A comparison of five methods for calculating the exhaust flow from internal combustion engines
N80-11482
Structural analysis of a 15,000 tons 'O' press
N80-11484
On the off-design performance of small radial turbines
N80-11485
Bathtub and related failure rate characterizations
[AD-A072626] N80-11490
Failure criteria for reinforced concrete structures. Volume 2. Analytical model and response data
[AD-A070644] N80-11511
Analysis of financial programs for energy conservation: Market simulation [penetration] model
[HCP/M8662-1] N80-11606
The dynamic response of solar cells
[CNES-NT-85] N80-11629
Environmental effects of heat and moisture release from atmospheric spray cooling systems
[CONF-780520-7] N80-11642
An investigation of a mathematical model for atmospheric absorption spectra
[NASA-CR-162430] N80-11677
Synthesis of regional ground motion from western US earthquakes
[AD-A069727] N80-11682
Simulation of land-use patterns affecting the global carbon cycle
[ORNL/TM-6651] N80-11701
Design study for the development and use of model output statistics in automated aviation weather forecasting
[AD-A072649] N80-11727
The calculation of evapotranspiration using the Penman formula
[KNMI-WR-79-3] N80-11736
The nested grid model
[PB-299046/3] N80-11745
Control of nonlinear systems
[AD-A072635] N80-11829
Noether's theory in classical nonconservative mechanics
[CSIR-TWISK-66] N80-11836
Vertex function and crossing symmetry — quantum mechanical many body problem
[CSIR-TWISK-53] N80-11841
Multistate reliability models
[AD-A072303] N80-11855
Limitations to the use of two-dimensional thermal modeling of a nuclear waste repository
[UCID-18101] N80-11888
On the balance equation for angular momentum in a plasma
[REPT-1670] N80-11917
Thermodynamic assessment of OTEC open-cycle power systems
[CONF-790459-2] N80-11938

MATHEMATICAL PROGRAMMING
Augmented restricted Lagrangians in convex programming
[CSIR-TWISK-62] N80-11802
A new class of feasible direction methods
[CSIR-TWISK-61] N80-11803
Trend-free block designs: Existence and construction results
[AD-A072138] N80-11863

MAXIMUM LIKELIHOOD ESTIMATES
Reliability prediction for mechanical systems
[AD-A071835] N80-11493
M-estimation in the presence of unequal scale
[CSIR-TWISK-60] N80-11839

MEAN
M-estimation in the presence of unequal scale
[CSIR-TWISK-60] N80-11839
Approximations of normal range revisited with new tables for d sub 2 and d sub 3 - factors
[AD-A073006] N80-11851
On sequential confidence intervals for the largest normal mean
[AD-A072599] N80-11856
A study of sequential procedures for estimating the larger mean
[AD-A072595] N80-11857

MEASURING INSTRUMENTS
Semiconductor technology program, progress briefs
[PB-298064/7] N80-11371
Semiconductor technology program, progress briefs
[PB-298063/9] N80-11372
An abrading system for the measurement of oxide thickness
[TDB-319] N80-11411
Elimination of the effect of surface microtopography in an improved soil skin moisture determinator
[AD-A072614] N80-11680

MECHANICAL DEVICES
Reliability prediction for mechanical systems
[AD-A071835] N80-11493

MECHANICAL IMPEDANCE
Force and moment impedance of infinite plates
[D3-1978] N80-11526

MECHANICAL PROPERTIES
Hygrothermal effects on the mechanical response of Kelvar 49/epoxy laminates
[SAND-78-1362C] N80-11154
Effect of thermally induced porosity on an as-HIP powder metallurgy superalloy
[NASA-TM-79263] N80-11189
Effect of periodic chemical variation on the mechanical properties of Ta foils
[LA-UR-78-3065] N80-11206
Program to discover materials suitable for service under hostile conditions obtaining in equipment for the gasification of coal and other solid fuels
[FE-1784-42] N80-11248
Behaviour of steel under cyclic loading — conference
[ICAF-1090] N80-11503

MEDIAN [STATISTICS]
M-estimation in the presence of unequal scale
[CSIR-TWISK-60] N80-11839

MEDICAL SERVICES
Telecommunications in medicine. A bibliography with abstracts
[NTIS/PS-79/0786/8] N80-11769

MEMBRANES
High flux PBI reverse osmosis membranes for desalination and water reuse
[PB-297285/9] N80-11184
Reduction of air emissions from gasoline storage tanks
[PB-297976/3] N80-11659

MENTAL PERFORMANCE
Intelligence as an information processing concept
[AD-A069953] N80-11775
Human failure detection and resource allocation in dynamic environment
[AD-A069821] N80-11778

MERCURY ION ENGINES
Specific spacecraft evaluation: Special report — charged particle transport from a mercury ion thruster to spacecraft surfaces
[NASA-CR-159420] N80-11137

MESOSPHERE
Scientific objective 2: Stratospheric and mesospheric chemistry and transport
N80-11417

METAL CUTTING
Laser cutting and machining: Metals. Citations from the engineering index data base
[NTIS/PS-79/0890/8] N80-11459

METAL FATIGUE
Behaviour of steel under cyclic loading — conference
[ICAF-1090] N80-11503

METAL FILMS
Coating laminated substrates
[BDX-613-2062-REV] N80-11153

METAL HYDRIDES
Investigations of intermetallic alloy hydriding mechanism
[ORO-5246-3] N80-11202

Low temperature heat capacity studies on hydrogen absorbing intermetallic compounds
[IS-M-210] N80-11201
METAL IONS
Chromatography of metal ions with a triazine chelating resin
[IS-T-855] N80-11167
METAL MATRIX COMPOSITES
Tensile and flexural strength of non-graphitic super-hybrid composites: Predictions and comparisons
[NASA-TM-79276] N80-11144
METAL OXIDE SEMICONDUCTORS
Oxidation of gallium arsenide in a plasma multiple device. Study of the MOS structures obtained
[LEP-79/62.SME-687-A] N80-11181
Nanosecond pulsers for MM wave tubes
[AD-A071414] N80-11313
Space dosimetry. Volume 2: Technical appendices
[FRI-R986/3-VOL-2] N80-11413
MNOS boram manufacturing methods and technology project
[AD-A071413] N80-11922
Study of the electronic surface states of 3-V compounds — study of surface properties of gallium arsenides to understand metal oxide semiconductors
[AD-A070164] N80-11925
METAL PARTICLES
Metallic wear particles: A short review
[UPTEC-79-11-R] N80-11490
Spectrally selective surfaces with coatings composed of ultrafine metal particles — solar collectors
[AED-CONF-78-212-004] N80-11620
METAL PLATES
Evaluation of yttriated titanium 6 Al-4 V plates and forgings
[AD-A072439] N80-11196
Development of laser welding techniques for joining armor
[AD-A072537] N80-11472
METAL POWDER
Palladium sintering: Shrinkage kinetics for a sponge powder
[SAND-78-8207] N80-11443
METAL SHEETS
Flight simulation fatigue crack propagation evaluation of candidate lower wing skin materials with particular consideration of spectrum truncation
[NLR-TR-77092-U] N80-11524
METAL SURFACES
Corrosion resistant thermal barrier coating — protecting gas turbines and other heat engine parts
[NASA-CASE-LEW-13088-1] N80-11142
Electrochemical deburring: Another sharp sword in the battle with burrs
[BDX-613-2132] N80-11262
An abrading system for the measurement of oxide thickness
[TDB-319] N80-11411
Effect of surface contamination of solid phase welding: An overview
[SAND-78-0223C] N80-11478
Elipsometry of surface layers on lead and lithium
[LBL-8375] N80-11926
METAL VAPORS
Resonance Raman spectra of metal halide vapor complexes
[CONF-780941-8] N80-11175
METAL WORKING
On the damping effect in surface plastic deformation — metal working techniques
N80-11021
Contour forming of various metals: Deformation and recrystallization characteristics
[LA-UR-78-1412] N80-11205
METALLIC GLASSES
Further measurements of the specific heats at low temperatures in metallic glasses
[UCRL-13908] N80-11231
METALS
Trace elements from coal combustion: Atmospheric emissions
[ICTIS/TR-05] N80-11180
Assessment of the state of knowledge pertaining to solid particle erosion
[AD-A073034] N80-11199
Implanted and annealed alloys in physical metallurgy
[SAND-78-1638C] N80-11204
Study of metal-oxygen solid solutions utilizing solid electrolytic cells
[COO-1198-1256] N80-11210
High precision metal stable isotope ratio measurements using volatile metal chelates
[CONF-780501-7] N80-11211
Metal hydroxides from electroplating sludge characterization and metal recovery
[AD-A070231] N80-11636
Trace metals and marine production processes — conference proceedings
[PB-298133/6] N80-11654
METEOROLOGICAL PARAMETERS
The Building Loads Analysis System Thermodynamics [BLAST] program version 2.0 Input booklet — for predicting energy consumption based on structural size and meteorological data
[AD-A072435] N80-11259
Scientific objective 4: Meteorological data
N80-11419
A report on atmospheric obstructions to visibility. Volume 1: Study results
[AD-A071701] N80-11717
The 19305A GSRS missile number 1025, round number V-31
[AD-A071894] N80-11718
The 19305A GSRS missile number 1055 round number V-31
[AD-A071880] N80-11719
Major midwest snowstorms
[AD-A072746] N80-11723
Mariners weather log, volume 23, number 3
[PB-298738/6] N80-11741
METEOROLOGICAL SATELLITES
Study of temperature/moisture retrieval capabilities of DMSP/SSH sensor channels
[AD-A071144] N80-11542
Satellite support to HIPLEX: Summary of results, 1976 - 1979
[PB-297839/7] N80-11729
METEOROLOGY
Feasibility study for selected Spacelab experiments conducted in the disciplines of earth observation and meteorology
[BMFT-FB-W-77-46] N80-11113
Meteorology and the human environment
[WMO-577] N80-11643
Radar echo organization and development in the mesoscale environment: A case study approach
[PB-296464/1] N80-11714
Spectral radiometric measurement and analysis program. Volume 1: Description of mobile radiometric laboratory system
[AD-A072078] N80-11722
METHANE
Methane recovery from sanitary landfills; gas recovery system installation and testing
[PB-296622/4] N80-11254
METHODOLOGY
Test procedure for C-band noncoherent radar transponder
[AD-A072069] N80-11286
METRICATION
U. S. Army metrication analysis and recommendations for DA implementation plan, volume 1
[AD-A069746] N80-11256
MEXICO
OTEC thermal resource report for western coast Mexico — climate and oceanographic parameters
[HCP/T2898] N80-11600
MICE
The 3-deoxy-d-glucose thermoregulatory effects in mice at various temperatures
[AD-A069511] N80-11757
MICROBALANCES
Investigations of intermetallic alloy hydriding mechanism
[ORO-5246-3] N80-11202
MICROBIOLOGY
Indirect microbial detection
[NASA-CASE-LAR-12520-1] N80-11756
MICROCOMPUTERS
Microcomputer-based video motion detection system
[N/DA-7909] N80-11797
MICROELECTRONICS
Joint services electronics program of the Edward L. Ginzton Laboratory of Stanford University
[AD-A072786] N80-11337
Hermetic sealing of hybrid microcircuits: Initial capability development
[BDX-613-1930-REV] N80-11350
MICROFIBERS
Small combustive particle sensor
[NASA-CASE-LAR-12552-1] N80-11400
MICROFILMS
Microfiche applications in an individualized, self-paced learning system
[AD-A069445] N80-11945
MICROORGANISMS
Indirect microbial detection
[NASA-CASE-LAR-12520-1] N80-11756
MICROPROCESSORS
Modular digital missile guidance
[AD-A072544] N80-11125
A comparison of low-cost microprocessors for the GPS receiver processor
[AD-A072832] N80-11793
Influence of microprocessor technology on instrument and system design
[CONF-780525-5] N80-11796
Architecture for higher level digital image processing
[AD-A071590] N80-11832
MICROSTRIP TRANSMISSION LINES
An improved theory for microstrip antennas and application, part 1
[AD-A070701] N80-11293
MICROSTRUCTURE
Effect of periodic chemical variation on the mechanical properties of Ta foils
[LASL-UR-78-1065] N80-11206
Structural related research — physicochemical and mechanical properties of materials
[AD-A071416] N80-11988
MICROWAVE AMPLIFIERS
Solid-state X-band combiner study
[NASA-CR-162432] N80-11328
MICROWAVE ANTENNAS
A multiple-beam microwave antenna based on the principle of the Mills cross
[AD-A072876] N80-11307
MICROWAVE ATTENUATION
Radio communications at extremely high frequencies: The use of meteorological data
[FUB-27-1978] N80-11320
MICROWAVE COUPLING
Multihole couplers between waveguides. Theory and experiments
[FUB-30-1978] N80-11367
MICROWAVE EQUIPMENT
I/J band low-cost crossed-field amplifier
[AD-A072311] N80-11330
On the use of a semi-automated test system for measuring the characteristics and/or the 'S' parameters of a quadrupolar network
[CNES-NT-87] N80-11363
Electric current controlled liquid phase epitaxy of compound semiconductors for microwave devices — indium phosphides
[AD-A072643] N80-11923
MICROWAVE FREQUENCIES
Oxidation of gallium arsenide in a plasma multiple device. Study of the MOS structures obtained
[LEP-79/62.SME-687-A] N80-11181
MICROWAVE RADIOMETERS
Measurements of important minor constituents in the middle atmosphere — microwave radiometer to measure water vapor in the middle atmosphere
[AD-A071845] N80-11679
MICROWAVE SCATTERING
Characterization of wave scattering from rainfall, with particular reference to the possible interference in earth-satellite-earth links at frequencies above 10 GHz
[FUB-26-1978] N80-11319
Electromagnetic wave propagation through randomly orientated nonspherical particles. A general theory
[FUB-31-1978] N80-11322
MICROWAVE TRANSMISSION
Technology assessment for future MILSATCOM systems: The EHF bands
[AD-A071886] N80-11290
A simple pulse peak detector
[RAE-TM-DW-10] N80-11369
MICROWAVES
Analysis of the exposure levels and potential biological effects of the PAVE PAWS radar system
[AD-A072332] N80-11302
Radiation intensity of the PAVE PAWS radar system
[AD-A072333] N80-11303
MILITARY OPERATIONS
U. S. Army metrication analysis and recommendations for DA implementation plan, volume 1
[AD-A069746] N80-11256
Study of automated command support systems
[AD-A072298] N80-11790
MILITARY TECHNOLOGY
Technology assessment for future MILSATCOM systems: The EHF bands
[AD-A071886] N80-11290
A model for estimating radiowave acquisition receiving system intercept probability
[AD-A072503] N80-11304
I/J band low-cost crossed-field amplifier
[AD-A072311] N80-11330
Laser physics and laser techniques
[AD-A072009] N80-11435
Laser induced luminescence of military targets
[AD-A073200] N80-11441
MILKY WAY GALAXY
An emission-line survey of the Milky Way
[NASA-SP-434] N80-11966
MINERAL EXPLORATION
SEASAT demonstration experiments with the offshore oil, gas and mining industries
[NASA-CR-162423] N80-11532
MINIATURE ELECTRONIC EQUIPMENT
Hobbing ratchet wheels for miniature mechanisms
[BDX-613-1927-REV] N80-11476
MINUTEMAN ICBM
LGM-30B, stage 2 dissected motors
[AD-A071402] N80-11139
MISSILE BODIES
The analysis of wing-body combinations at moderate angles of attack — missile bodies
[AD-A074284] N80-11040
Kinetic heating of high speed missiles
[PREPRINT-1975-5] N80-11128
MISSILE CONTROL
Modular digital missile guidance
[AD-A072544] N80-11125
Distributed source generation for RF environmental modeling for hardware-in-the-loop missile guidance simulation
[AD-A072927] N80-11126
MISSILE DESIGN
Application of IPAD to missile design
[NASA-CR-132671] N80-11120
Kinetic heating of high speed missiles
[PREPRINT-1975-5] N80-11128
MISSILE RANGES
Test procedure for C-band noncoherent radar transponder
[AD-A072069] N80-11286

MISSILE TRACKING
Real-time video tracking concepts
[AD-A071792] N80-11893
MISSILES
Tri-FAST hardware-in-the-loop simulation. Volume 1: Tri-FAST hardware-in-the-loop simulation at advanced simulation center
[AD-A072919] N80-11063
MISSION PLANNING
Planning synthesis for Spacelab projects in communication and navigation
[BMFT-FB-W-78-30] N80-11116
Shuttle atmospheric lidar program evolution
N80-11424
Design study for the development and use of model output statistics in automated aviation weather forecasting
[AD-A072849] N80-11727
MISSOURI RIVER [US]
Energy development vs water quality in the upper Colorado and upper Missouri River Basins
[LA-7497-MS] N80-11641
MIXING
Analysis of backmixing and mass transfer in solvent extraction columns
[IS-T-851] N80-11166
MIXING LENGTH FLOW THEORY
Is the sun constant?
[ATR-79[9552]-4] N80-11981
MIXTURES
Performance of a gel permeation chromatograph and its usefulness in examining mixtures of organic materials --- epoxy resin aircraft adhesives
[MRL-R-725] N80-11158
MODELS
Opportunistic Maintenance Engine Simulation model: OMENS 2
[AD-A072516] N80-11088
MODULES
Shuttle atmospheric lidar program evolution
N80-11424
MODULUS OF ELASTICITY
Classical analyses of laminated bimodulus composite-material plates
[AD-A072276] N80-11147
MOISTURE
Hygrothermal effects on the mechanical response of Kelvar 49/epoxy laminates
[SAND-78-1362C] N80-11154
MOISTURE CONTENT
Transient hydrothermal stresses in composites: Coupling of moisture and heat with temperature varying diffusivity --- graphite-epoxy composite materials
[AD-A072613] N80-11149
MOLDING MATERIALS
Cooling aluminum molds using heat pipes
[BDX-613-2039-REV] N80-11384
MOLECULAR BEAMS
Molecular beam studies of ion-molecule reactions
[COO-2640-8] N80-11883
MOLECULAR COLLISIONS
Atomic and molecular interaction theory
[AD-A072124] N80-11878
MOLECULAR EXCITATION
Isotope separation by laser-induced photomigration --- boron chlorides
[LA-TR-78-36] N80-11882
MOLECULAR INTERACTIONS
Molecular beam studies of ion-molecule reactions
[COO-2640-8] N80-11883
MOLECULAR IONS
Ion photofragment spectroscopy: Potential surfaces of molecular ions
[AD-A073000] N80-11879
MOLECULAR OSCILLATIONS
Optical and discharge studies of novel electronic transistion laser species
[AD-A071853] N80-11439
MOLECULAR RELAXATION
High temperature gas energy transfer
[AD-A072727] N80-11884
MOLECULAR STRUCTURE
Determination of physical and chemical states of lubricants in concentrated contacts, part 1
[NASA-CR-3204] N80-11225
Ion photofragment spectroscopy: Potential surfaces of molecular ions
[AD-A073000] N80-11879
The C-13 study of the potential influence of thermal aging on the molecular integrity of FEFO
[MHSMP-78-32] N80-11881
MOLECULES
Comets: Cosmic connections with carbonaceous meteorites, interstellar molecules and the origin of life
N80-11975
MOMENT DISTRIBUTION
On the lengths of the pieces of a stick broken at random
[CTH-MATH-1979-13] N80-11860
MONITORS
Automated monitoring of thin film capacitors for electrical breakdown
[BDX-613-2076-REV] N80-11359
A simple pulse peak detector
[RAE-TM-DW-10] N80-11369
Proceedings of the 28th Meeting of the Mechanical prevention group, Report on MFPG detection, diagnosis, and prognosis
[NASA-TM-80881] N80-11502
MONSOONS
First session of the WAMEX scientific and management regional committee
[GARP-SPEC-REPT-31] N80-11731
MONTANA
Bell Creek residual oil saturation technology test
[BETC-2180-4] N80-11546
MOTION STABILITY
On free periodic parachute system oscillations in the axial plane
N80-11027
MRCA AIRCRAFT
On the development of The RB 199
[DRIC-TRANS-5429] N80-11096
MULTICHANNEL COMMUNICATION
Design of a Multichannel FM/FM telemetry system for high G environment applications
[SAND-78-8042] N80-11133
MULTIPATH TRANSMISSION
Precipitation and multipath effects on propagation phenomena. System characteristics and transmission quality of numerical radio links with and without frequency reuse
[FUB-29-1978] N80-11321
MULTIPLE ACCESS
An efficient contention resolution algorithm for multiple access channels
[AD-A072440] N80-11847
MULTIPLE BEAM INTERVAL SCANNERS
Concepts for 18/30 GHz satellite communication system, volume 1
[NASA-CR-159625-VOL-1] N80-11277
Concepts for 18/30 GHz satellite communication system, volume 1A: Appendix
[NASA-CR-159625-VOL-1A] N80-11278
Concepts for 18/30 GHz satellite communication system study. Executive summary
[NASA-CR-159680] N80-11279
A multiple-beam microwave antenna based on the principle of the Mills cross
[AD-A072876] N80-11307
MULTIPLEXING
Avionic system architecture investigation [AVSAR II]
[AD-A071743] N80-11080
Considerations on projects for high capacity and long distance numerical data transmission systems
[FUB-50-1977] N80-11316
MULTIPROCESSING [COMPUTERS]
An experiment in distributed interpretation
[AD-A072558] N80-11792
MULTIPROGRAMMING
A new class of feasible direction methods
[CSIR-TWISK-61] N80-11803
MULTISPECTRAL BAND SCANNERS
Automated earth resources surveys using satellite and aircraft scanner data: A Finnish approach
[VTT-LU-15] N80-11547
Wide angle optical systems --- multispectral scanner
[NASA-CASE-MSC-18373-1] N80-11892
MULTISPECTRAL PHOTOGRAPHY
Processing and display techniques for multispectral satellite imagery
[AD-A072509] N80-11534
MULTIVARIATE STATISTICAL ANALYSIS
Discrete multivariate analysis on radiobiological results from the biostack 3 Bacillus subtilis experiment
N80-11759
Multistate reliability models
[AD-A072303] N80-11855
MULTIVIBRATORS
One shots and alternatives in synchronous digital system design --- undesirable features of monostable multivibrators
[LBL-8722] N80-11353
MUSCULOSKELETAL SYSTEM
Identification of controls in neuro-musculoskeletal control system models
[CSIR-TWISK-52] N80-11761

N

NASA PROGRAMS
An evaluation of the NASA Tech House, including live-in test results, volume 1
[NASA-TP-1564] N80-11559
Small transport aircraft technology. A report for the committee on commerce, science, and transportation, United States Senate
[NASA-TM-80813] N80-11953
NATIONAL AVIATION SYSTEM
Provisional message formats for the DABS/NAS interface
[AD-A073461] N80-11274
NATURAL GAS
National Gas Survey report to the Federal Energy Regulatory Commission by the Supply-Technical Advisory Task Force on nonconventional natural gas resources
[DOE/FERC-0010] N80-11251
NAVIGATION AIDS
Inertial navigation and guidance. Citations from the international aerospace abstracts data base
[NTIS/PS-79/0825/4] N80-11064
Planning synthesis for Spacelab projects in communication and navigation
[BMFT-FB-W-78-30] N80-11116
NEAR INFRARED RADIATION
Spectral radiometric measurement and analysis program. Volume 4: SCAT3 operator's manual
[AD-A072081] N80-11720
Spectral radiometric measurement and analysis program. Volume 3: Data analysis and formulation of the model
[AD-A072080] N80-11721
NEBULAE
An emission-line survey of the Milky Way
[NASA-SP-434] N80-11966
NEODYMIUM LASERS
Janus neodymium glass laser operations manual
[UCID-17952] N80-11453
Neodymium YAG lasers. Citations from the international aerospace abstracts data base
[NTIS/PS-79/0862/7] N80-11461
Neodymium YAG lasers. A bibliography with abstracts
[NTIS/PS-79/0883/3] N80-11466
NEON
Desorption heat capacity of 4He adsorbed on solid neon
[UPTEC-78-17-R] N80-11265
Heat capacity of submonolayers of 3He adsorbed on solid neon
[UPTEC-78-31-R] N80-11267
NETHERLANDS
The use of a trajectory model for studying interregional transport of air pollution
[KNMI-WR-79-6] N80-11645
Verification of twelve and 24 hour geostrophic wind forecasts at 850 mbar using BK3 at IJmuiden over the period of 1 October 1972 to 30 Novenber 1976
[KNMI-WR-79-7] N80-11738
Space research in the Netherlands, 1978
N80-11996
NETWORK ANALYSIS
Analysis and synthesis problems in dimensioning packet switched networks
[FUB-32-1978] N80-11826
NETWORK SYNTHESIS
Integrated Autodin System [IAS]: Generation of viable far-term architectures for IAS
[AD-A072165] N80-11288
Analysis and synthesis problems in dimensioning packet switched networks
[FUB-32-1978] N80-11826
NEUTRON IRRADIATION
Annealing of neutron-irradiated vanadium containing oxygen
[IS-T-816] N80-11215
NEW JERSEY
Air quality maintenance analysis for New Jersey-New York and mid-Hudson AQMA
[PB-297988/8] N80-11655
NEW MEXICO
Midtemperature Solar Systems Test Facility [MSSTF] project test results: Phase 4A MSSTF system operation
[SAND-78-1088] N80-11613
NEW YORK
Reconnaissance survey of the distribution and abundance of benthic organisms in the New York Bight Apex 5-14 June 1973
[PB-297333/7] N80-11552
Air quality maintenance analysis for New Jersey-New York and mid-Hudson AQMA
[PB-297988/8] N80-11655
NICKEL
Effects of impurities on the weldability of electroformed nickel
[NASA-CR-162455] N80-11214
NICKEL ALLOYS
Hot corrosion degradation of metals and alloy: A unified theory --- nickel and cobalt based alloys
[AD-A072645] N80-11194
Ductility minimum and its reversal with prolonged aging in cobalt-and nickel-base superalloys
[CONF-781202-35] N80-11209
NICKEL STEELS
On the influence of nickle on toughness and ductile-brittle transition in low-carbon lath martensite steels
[UPTEC-78-53-R] N80-11223
NIGHT FLIGHTS [AIRCRAFT]
In-flight performance evaluation of experimental information
[AD-A071701] N80-11084
NIGHT VISION
In-flight performance evaluation of experimental information
[AD-A071701] N80-11084
NIKE X SYSTEMS
Accuracy validation of the modified Nike Hercules radar
[AD-A071720] N80-11291
NIKE-HERCULES MISSILE
Accuracy validation of the modified Nike Hercules radar
[AD-A071720] N80-11291
NIOBIUM
Partial molar volumes of hydrogen and deuterium in niobium and vanadium
[IS-T-839] N80-11172
NITRAMINE PROPELLANTS
Workshop report: Fundamental reactions in solid propellant combustion --- conferences
[AD-A072162] N80-11239

NITRIC OXIDE
Determination of the solar photon flux in the range of from 160 to 220 nm using the photolysis of ammonia combined with nitric oxide detection
[BMFT-FB-W-78-12] N80-11982
NITRIDES
MNOS boram manufacturing methods and technology project
[AD-A071413] N80-11922
NITROGEN FLUORIDES
Advanced laser concepts. Addendum: Production of excited states
[AD-A071393] N80-11436
Modeling studies of the mixing and chemistry of the NF radicals on the tristream nozzle
[AD-A071315] N80-11440
NITROGEN ISOTOPES
Isotopic composition of primary cosmic ray nitrogen and oxygen with consequences for source models
[LUIP-7811] N80-11986
NITROGEN OXIDES
Study of the nature of ozone, oxides of nitrogen, and nonmethane hydrocarbons in Tulsa, Oklahoma. Volume 2: Data tabulation
[PB-297801/3] N80-11649
Technical assessment of thermal DeNOx process --- for coal fired boilers
[PB-297947/4] N80-11656
NITROGEN PLASMA
Inductively coupled plasma-atomic emission spectroscopy: An evaluation of the use of nitrogen-argon admixtures as plasma discharge atmospheres
N80-11177
NOISE MEASUREMENT
True-integrating environmental noise monitor and sound exposure level meter. Volume 2: Wiring and parts lists, parts layouts, and schematics
[AD-A072002] N80-11871
NOISE METERS
True-integrating environmental noise monitor and sound exposure level meter. Volume 2: Wiring and parts lists, parts layouts, and schematics
[AD-A072002] N80-11871
NOISE POLLUTION
National environmental/energy workforce assessment, phase 3. Noise programs --- indexes to noise pollution education programs
[PB-298581/0] N80-11671
Airport noise. A bibliography with abstracts
[NTIS/PS-79/0878/3] N80-11674
True-integrating environmental noise monitor and sound exposure level meter. Volume 2: Wiring and parts lists, parts layouts, and schematics
[AD-A072002] N80-11871
NOISE PREDICTION [AIRCRAFT]
Noise of a model helicopter rotor due to ingestion of turbulence
[NASA-CR-3213] N80-11067
NOISE REDUCTION
Enhancement and bandwidth compression of noisy speech
[AD-A073139] N80-11305
An approximation technique for small noise open loop control problems
[AD-A072638] N80-11849
A method for predicting the noise levels of coannular jets with inverted velocity profiles
[NASA-CR-3176] N80-11868
A closed-form solution for noise contours
[NASA-TP-1432] N80-11869
NOISE SPECTRA
Raster-scan display photometric noise measurement
[AD-A073024] N80-11308
Noise and optimization of the dc SQUID
[LBL-8510] N80-11345
NONCONSERVATIVE FORCES
Noether's theory in classical nonconservative mechanics
[CSIR-TWISK-66] N80-11836
NONDESTRUCTIVE TESTS
Experimental electro-thermal method for nondestructively testing welds in stainless steel pipes
[HEDL-SA-1705] N80-11497
Proceedings of the 28th Meeting of the Mechanical prevention group, Report on MFPG detection, diagnosis, and prognosis
[NASA-TM-80881] N80-11502
NONFLAMMABLE MATERIALS
A porcine bioassay method for analysis of thermally protective fabrics: A clinical grading system
[AD-A069202] N80-11766
NONLINEAR EQUATIONS
Almost periodic N-soliton solutions of the nonlinear hydrodynamic Kaup equation
[PM/79/10] N80-11397
Functional sensitivity for ordinary differential equations
[CSIR-TWISK-65] N80-11837
NONLINEAR SYSTEMS
A model for nonlinear creep of concrete
[ISD-REPT-246] N80-11263
An experimental investigation of the reduction of nonlinear effects using passive compensating networks
[AD-A072422] N80-11284
A proposal for a nonlinear method of representation of voice signals
[FUB-33-1978] N80-11323
Discontinuous deformation gradients in the finite twisting of an incompressible elastic tube
[AD-A071728] N80-11507
Control of nonlinear systems
[AD-A072635] N80-11829
Quantitative synthesis of multiple loop feedback systems with large plant uncertainty
[AD-A072644] N80-11833
NONSYNCHRONIZATION
Investigation of load-induced non-sychronous whirl instabilities in rotating machinery
[AD-A071716] N80-11471
NORMAL DENSITY FUNCTIONS
On the lengths of the pieces of a stick broken at random
[CTH-MATH-1979-13] N80-11860
NOSE TIPS
Supersonic flow measurements in the body vortex wake of an Ogive nose cylinder
[AD-A071337] N80-11039
Optimun shape for transpiration-cooled nosetip of a reentry vehicle
[AD-A072296] N80-11118
NOTCH TESTS
Development of a realistic stress analysis for fatigue analysis of notched composite laminates
[NASA-CR-159119] N80-11146
NOZZLE FLOW
Fuselage and nozzle pressure distributions on a 1/12-scale F-15 propulsion model at transonic speeds --- conducted in langley 16 foot transonic tunnel
[NASA-TP-1521] N80-11036
Modeling studies of the mixing and chemistry of the NF radicals on the tristream nozzle
[AD-A071315] N80-11440
NUCLEAR EMULSIONS
A combined TLD/emulsion method of sampling dosimetry applied to Apollo missions
[NASA-CR-160367] N80-11985
NUCLEAR FUSION
Magnetic mirror fusion research at the Lawrence Livermore Laboratory
[UCRL-82318] N80-11908
NUCLEAR HEAT
General-purpose heat source project space nuclear safety program and radioisotopic terrestrial safety program --- plutonium oxide
[LA-7519-PR] N80-11889
NUCLEAR PHYSICS
Collective states and crossing symmetry
[CSIR-TWISK-58] N80-11840
Theoretical and high energy physics
[COO-1764-342] N80-11912
NUCLEAR POWER PLANTS
Evaluation of nuclear power plant siting by probabilistic assessment of environmental impact
[VTT-EN-24] N80-11891
NUCLEAR PUMPED LASERS
LASL program in nuclear pumped liquid lasers
[LA-UR-78-3016] N80-11446
Nuclear pumped electronic transition laser studies
[LA-UR-78-3015] N80-11447
NUCLEAR REACTORS
Analysis of beryllium parts for cosmos 954
[UCRL-52597] N80-11127
Comparison of polymer flammabilities and a determination of the loss of fire retardant additives with aging
[SAND-79-0978C] N80-11230
Comparisons of RETRAN and two-velocity two-phase flow models with experimental data
[EPRI-NP-928] N80-11392
Seismic safety margins research program overview
[UCRL-81884] N80-11696
NUCLEATE BOILING
Heat transfer correlation development and assessment: A summary and assessment of return to nucleate boiling phenomena during blowdown tests conducted at the Idaho National Engineering Laboratory
[INEL]
[CDAP-TR-054] N80-11387
NUCLEATION
Ellipsometry of anodic film growth
[LBL-8082] N80-11927
NUMERICAL ANALYSIS
Aerodynamic heating of blunt wedges
N80-11008
Numerical solution of recirculating flow by a simple finite element recursion relation
[DP-MS-78-83] N80-11381
Numerical solution of turbulent flow problems in general geometry
[KAPL-4116] N80-11382
Application of implicit numerical methods to problems in two-phase flow
[NUREG-CR-0763] N80-11383
Spatial population analysis: Methods and computer programs
[IIASA-RR-78-18] N80-11939
NUMERICAL CONTROL
Lasers in machine tool controls
[Y/DA-8211] N80-11444
NUMERICAL INTEGRATION
On the numerical solution of Cauchy integrals
N80-11853
NUMERICAL WEATHER FORECASTING
Verification of twelve and 24 hour geostrophic wind forecasts at 850 mbar using BK3 at IJmuiden over the period of 1 October 1972 to 30 November 1976
[KNMI-WR-79-7] N80-11738

O

OBSERVATION
Optical artificial satellite searches --- summary of using celestial mechanics in astronomy for observations
[AD-A071248] N80-11124
OCEAN BOTTOM
Reconnaissance survey of the distribution and abundance of benthic organisms in the New York Bight Apex 5-14 June 1973
[PB-297333/7] N80-11552
Preliminary assessment of industrial needs for an advanced ocean technology
[NASA-CR-162435] N80-11747
OCEAN MODELS
Numerical case studies for oceanic thermal anomalies with a dynamic model
[AD-A072587] N80-11748
OCEAN SURFACE
Implementation plan for the determination of the atmospheric contribution of petroleum hydrocarbons to the oceans.
[WMO-504] N80-11644
OCEAN THERMAL ENERGY CONVERSION
OTEC thermal resource report for Caribbean Sea Plant Ship 13-15 degrees N 75-80 degrees N
[HCP/T2898] N80-11599
OTEC thermal resource report for western coast Mexico --- climate and oceanographic parameters
[HCP/T2898] N80-11600
Ocean systems, program summary
[DOE/ET-0083] N80-11751
Thermodynamic assessment of OTEC open-cycle power systems
[CONF-790459-2] N80-11938
OCEANOGRAPHIC PARAMETERS
OTEC thermal resource report for western coast Mexico --- climate and oceanographic parameters
[HCP/T2898] N80-11600
Numerical case studies for oceanic thermal anomalies with a dynamic model
[AD-A072587] N80-11748
OCEANOGRAPHY
Interannual variability of the ocean atmosphere system
[NASA-CR-162456] N80-11730
Physical oceanography program
[AD-A073115] N80-11750
OCEANS
All the water on earth is all the water there is --- ocean pollution
[PB-298340/1] N80-11653
OCULOMETERS
Performance, physiological, and oculometer evaluation of VTOL landing displays
[NASA-CR-3171] N80-11771
OFFSHORE ENERGY SOURCES
SEASAT demonstration experiments with the offshore oil, gas and mining industries
[NASA-CR-162423] N80-11532
OFFSHORE PLATFORMS
Preliminary assessment of industrial needs for an advanced ocean technology
[NASA-CR-162435] N80-11747
OH-6 HELICOPTER
A compilation and analysis of helicopter handling qualities data. Volume 1: Data compilation
[NASA-CR-3144] N80-11097
OIL RECOVERY
Tertiary oil recovery processes research at the University of Texas
[BETC-0001-1] N80-11544
Oil recovery by carbon dioxide injection --- West Virginia
[ORO-5301-34] N80-11545
Bell Creek residual oil saturation technology test
[BETC-2180-4] N80-11546
OIL SLICKS
Airborne oil spill surveillance systems in Sweden
[FP1-9] N80-11646
OKLAHOMA
Study of the nature of ozone, oxides of nitrogen, and nonmethane hydrocarbons in Tulsa, Oklahoma. Volume 2: Data tabulation
[PB-297801/3] N80-11649
ONBOARD EQUIPMENT
Space dosimetry. Volume 2: Technical appendices
[FRI-R646/3-VOL-2] N80-11413
ONE DIMENSIONAL FLOW
A comparison of five methods for calculating the exhaust flow from internal combustion engines
N80-11482
OPERATIONS RESEARCH
Concept for a worldwide civil maritime satellite communication network [MARSAT]. Operation system study
[BMFT-FB-W-77-13] N80-11313
Comparison of some instrumental variable methods: Consistency and accuracy aspects
[UPTEC-78-88-R] N80-11499

OPERATORS [MATHEMATICS]
An investigation of portable electromagnetic pulse simulators/alternate simulators
[AD-A071342] N80-11292
OPERATORS [PERSONNEL]
Human failure detection and resource allocation in dynamic environment
[AD-A069821] N80-11778
OPTICAL COMMUNICATION
Injection-laser diodes for fiber optic communications
[AD-A072504] N80-11431
OPTICAL CORRECTION PROCEDURE
Fresnel zone correction plates for the electron microscope
[UCRL-TRANS-11440] N80-11900
OPTICAL COUPLING
Investigation of a multimode fiber optic coupler
[AD-A071874] N80-11696
OPTICAL EMISSION SPECTROSCOPY
An experimental apparatus for measuring the thermal absorption of GaSe sub 1-x sub x components
[ISS-T-78/17] N80-11930
OPTICAL FILTERS
Activities report of the Image Laboratory
[ENST-D-79005] N80-11901
OPTICAL MEASUREMENT
A study of coherent structures in axisymmetric jets using an optical technique
[AASU-341] N80-11399
OPTICAL MEASURING INSTRUMENTS
A method for the measurement of mixing properties in a turbulent jet flow
[VKI-TN-130] N80-11398
OPTICAL PROPERTIES
Infrared optical properties of bipropellant cryocontaminants
[AD-A073186] N80-11242
OPTICAL RADAR
Shuttle atmospheric lidar research program
[NASA-SP-433] N80-11414
Scientific objectives
N80-11415
Scientific objective 1: Global flow of water vapor and pollutants
N80-11416
Scientific objective 4: Meteorological data
N80-11419
Scientific objective 7: Magnetospheric sun and weather relationships
N80-11422
Candidate shuttle lidar experiments
N80-11423
Shuttle atmospheric lidar program evolution
N80-11424
Appendix A: Descriptions of shuttle borne lidar experiments
N80-11425
Appendix B: Lasers of potential use for shuttle lidar
N80-11426
Appendix C: Transmitting and receiving optics considerations
N80-11427
Appendix D: Spectral discriminators and detectors for shuttle lidar
N80-11428
Laser deflection analysis
[AD-A072560] N80-11432
Summer research fellowship program
[NASA-CR-159153] N80-11940
OPTICAL SCANNERS
Design of an experimental program for evaluation of LBR systems
[AD-A071526] N80-11433
OPTICAL TRACKING
Real-time video tracking concepts
[AD-A071792] N80-11893
OPTICAL WAVEGUIDES
Waveguide studies for fiber optic sources
[AD-A071446] N80-11897
OPTIMAL CONTROL
Optimal object control with worst random parameter distribution
N80-11016
Analytic design of regulators for variable-parameter systems
N80-11020
Inequalities and approximation with applications to VSTOL aircraft — using control theory for optimal control approximations
[AD-A071807] N80-11099
Energy savings for a solar heated and cooled building through adaptive optimal control
[LA-UR-78-2986] N80-11616
Optimal feedback control laws using random sampling of the observation
[CSIR-TWISK-63] N80-11827
On the regularity and approximation of the solutions of some optimal control problems governed by elliptic equations
[CSIR-TWISK-47] N80-11842
OPTIMIZATION
Analytic design of complex systems, 1
N80-11014
Fuel minimal take-off path of jet lift VTOL aircraft, log no. C3558
N80-11066
Design optimization of aquifer reservoir-based compressed air storage systems
[CONF-781046-5] N80-11628
Measure-valued processes in the control of partially-observable Stochastic systems
[AD-A072070] N80-11830
Hybrid optimization in urban traffic networks
[PB-297146/3] N80-11960
ORBIT TRANSFER VEHICLES
Solar power satellite system definition study
[NASA-CR-160368] N80-11123
OREGON
An economic analysis of five selected LANDSAT assisted information systems in Oregon
[NASA-CR-162434] N80-11533
ORGANIC COMPOUNDS
X-ray excited optical luminescence of polynuclear aromatic hydrocarbons
[IS-T-856] N80-11165
An EPA manual for organics analysis using gas chromatography-mass spectrometry
[PB-297164/6] N80-11182
Ambient air carcinogenic vapors, improved sampling and analytical techniques and field studies
[PB-297932/6] N80-11185
ORGANIC NITRATES
Workshop report. Fundamental reactions in solid propellant combustion — conferences
[AD-A072162] N80-11239
ORTHOGONAL FUNCTIONS
Spheroidal functions. Theoretical studies and computational techniques
[CNES-NT-88] N80-11819
OSCILLATIONS
On free periodic parachute system oscillations in the axial plane
N80-11027
The oscillating two stream and parametric decay instabilities in a weakly magnetized plasma
[AD-A072396] N80-11907
OSMOSIS
High flux PBI reverse osmosis membranes for desalination and water reuse
[PB-297285/9] N80-11184
OXIDATION
Lectures on combustion theory
[COO-3077-153] N80-11170
Oxidation of gallium arsenide in a plasma multiple device. Study of the MOS structures obtained
[LEP-79/62 SME-687-A] N80-11181
OXIDE FILMS
An abrading system for the measurement of oxide thickness
[TDB-319] N80-11411
OXYGEN
Platinum-substitute materials as electrocatalysts for oxygen reduction
[PB-297261/0] N80-11186
Adsorption of oxygen on Pt [111] and its reactivity to hydrogen and carbon monoxide
[AD-A072710] N80-11198
Study of metal-oxygen solid solutions utilizing solid electrolytic cells
[COO-1198-1216] N80-11210
Annealing of neutron-irradiated vanadium containing oxygen
[IS-T-816] N80-11215
OZONE
Study of the nature of ozone, oxides of nitrogen, and nonmethane hydrocarbons in Tulsa, Oklahoma. Volume 2: Data tabulation
[PB-297801/3] N80-11649
Interaction of low levels of ozone and relative humidity on leafy vegetables
[PB-297062/2] N80-11658
Ion photofragment spectroscopy: Potential surfaces of molecular ions
[AD-A073000] N80-11879

P

PALLADIUM
Palladium sintering: Shrinkage kinetics for a sponge powder
[SAND-78-8207] N80-11443
PANORAMIC CAMERAS
Concept and feasibility study on a very wide angle photographic camera for Spacelab
[BMFT-FB-W-77-17] N80-11409
PARABOLIC ANTENNAS
Parabolic antenna for home receivers of the Broadcasting Satellite System
[BMFT-FB-W-78-11] N80-11314
PARACHUTE DESCENT
On free periodic parachute system oscillations in the axial plane
N80-11027
PARALLEL PROCESSING [COMPUTERS]
Scheduling parallel processes without a common scheduler — a systems analysis of computer programming and computer system design for scheduling parallel processes
[AD-A072158] N80-11814
PARAMETERIZATION
On-line structural response analysis: Using the extended Kalman estimator/identifier
[UCID-18175] N80-11516
PARAMETRIC FREQUENCY CONVERTERS
Analysis and Design of a phase linearization system for traveling wave tube amplifiers
[CNES-NT-86] N80-11362
PARTIAL DIFFERENTIAL EQUATIONS
The role of the asymmetric terms of the divergence and vorticity equations in the zero Laplacian vortex
[AD-A072452] N80-11850
PARTICLE ACCELERATORS
Development of a 3 MV pulse transformer
[SAND-79-0813] N80-11344
Magnetic propulsion railguns: Their design and capabilities
[UCRL-82677] N80-11866
PARTICLE BEAMS
Space charge limited transport and bunching of non K-V beams
[AD-A072417] N80-11877
PARTICLE DIFFUSION
Two-dimensional transient dispersion and adsorption in porous media
[UCRL-81970] N80-11386
PARTICLE ENERGY
A spectrometer for detecting charged particles of medium energies: Experiment KED-ISEE
[BMFT-FB-W-78-19] N80-11410
PARTICLE INTERACTIONS
Tests of strong, electromagnetic interactions and weak interactions with positron electron collisons
[PM/79/8] N80-11886
Perturbation method on the study of the interaction of the solar wind with comets
[INPE-1529-RPE/081] N80-11944
PARTICLE SIZE DISTRIBUTION
Generation rate of turbulent patches in the laminar boundary layer of a submersible
[AD-A071796] N80-11380
PARTICLES
Chemical analysis of aerosols and airborne particulates, volume 2. A bibliography with abstracts
[NTIS/PS-79/0791/8] N80-11675
PARTICULATE SAMPLING
Efficiency of aerosol collection on wires exposed in the stratosphere
[NASA-TM-81147] N80-11676
PASSENGER AIRCRAFT
Selecting the passenger airplane fuselage
N80-11024
Small transport aircraft technology. A report for the committee on commerce, science, and transportation, United States Senate
[NASA-TM-80813] N80-11953
PASSIVITY
An experimental investigation of the reduction of nonlinear effects using passive compensating networks
[AD-A072422] N80-11284
PATTERN RECOGNITION
Development of the statistical pattern recognition methodology and its application to quality control
[ENST-D-78023] N80-11500
PATTERN REGISTRATION
Preprocessing of PHERMEX flash radiographic images with Haar and adaptive filtering --- enhancement of lines and/or edges
[LA-7561-MS] N80-11404
PAVEMENTS
Analysis of pavement systems
[PB-298098/5] N80-11268
Geometrics, hydraulics, and hydrology
[PB-298102/5] N80-11269
PENETRATION
Effect of weld penetration on the stress concentration factor for cruciform welded joints
N80-11522
Approximate methods for the analysis of earth penetration
[SAND-78-1748C] N80-11697
PERCEPTION
Cognitive styles: A review of the literature
[AD-A069435] N80-11772
PERFORMANCE PREDICTION
Statistical diagnostics aircraft engines
N80-11006
Off-design performance prediction of radial inflow turbines, volume 2
N80-11479
On the off-design performance of small radial turbines
N80-11485
Statistical energy analysis response prediction methods for structural systems
[NASA-CR-161334] N80-11506
PERFORMANCE TESTS
Survey of the activities concerning sensitivity test methods for explosives
[PML-1979-20] N80-11253
A comparative 5000 hours life test of light emitting diode displays, including 22 variants from 10 manufacturers
[ECR-86] N80-11370
Studies of dust cake formation and structure in fabric filtration: Second year
[PB-297581/1] N80-11650
PERIODICALS
Development of a model of the demand for scientific and technical information services
[PB-297826/0] N80-11948

Development of a planning guide to innovation in the dissemination of scientific information
[PB-296537/4] N80-11949
PERMAFROST
Detection of arctic water supplies with geophysical techniques
[AD-A072157] N80-11538
PERMEATING
Performance of a gel permeation chromatograph and its usefulness in examining mixtures of organic materials --- epoxy resin aircraft adhesives
[MRL-R-725] N80-11158
PERSONNEL
Design of safe electrical equipment for research
[LA-7597-MS] N80-11346
PERTURBATION
Acoustic phase fluctuations caused by Garrett-Munk internal waves
[AD-A071354] N80-11872
PERTURBATION THEORY
Perturbation method on the study of the interaction of the solar wind with comets
[INPE-1529-RPE/061] N80-11944
PESTICIDES
National environmental/energy workforce assessment, phase 3. Pesticides and toxicology programs --- post-secondary educational directory
[PB-298582/8] N80-11664
PH
Improvements in apparatus for pH measurement of water
[TDB-320] N80-11412
PHASE DIAGRAMS
A generalized time-temperature-transformation phase diagram for thermosetting systems
[AD-A073007] N80-11163
PHASE MODULATION
Self-phase modulation and transmission in optical fibers
[FUB-23-1978] N80-11318
Analysis and Design of a phase linearization system for traveling wave tube amplifiers
[CNES-NT-86] N80-11362
PHASE SHIFT
Multihole couplers between different waveguides. Theory and experiments
[FUB-30-1978] N80-11367
PHASE SHIFT KEYING
Precipitation and multipath effects on propagation phenomena. System characteristics and transmission quality of numerical radio links with and without frequency reuse
[FUB-29-1978] N80-11321
PHASE TRANSFORMATIONS
A generalized time-temperature-transformation phase diagram for thermosetting systems
[AD-A073007] N80-11163
PHASED ARRAYS
Hemispherical coverage of four-faced aircraft arrays
[AD-A073079] N80-11309
PHOSPHORUS POLYMERS
Toxicity and thermal properties of polyphosphazenes
[AD-A072120] N80-11228
PHOTOCHEMICAL OXIDANTS
Smog chamber validation using Lagrangian atmospheric data
[PB-297480/6] N80-11662
PHOTOCONDUCTORS
An experimental apparatus for measuring the thermal absorption of GaSe sub 1-x sub x components
[ISS-T-78/17] N80-11930
PHOTODIODES
Radiation effects in optical emitters and receivers
[SAND-78-1798] N80-11899
PHOTOELECTRON SPECTROSCOPY
Numerical deconvolution of photoelectron spectra of liquids
[AD-A073087] N80-11164
PHOTOGRAPHIC FILM
Investigations of the use of conventional films in the ETL cartographic EBR
[AD-A072628] N80-11539
PHOTOINTERPRETATION
Strip detection using relaxation
[AD-A071606] N80-11894
PHOTOIONIZATION
Photo ion mass spectrometry and photoelectron spectroscopy of high temperature vapors
[CONF-780941-4] N80-11174
PHOTOLYSIS
Determination of the solar photon flux in the range of from 160 to 220 nm using the photolysis of ammonia combined with nitric oxide detection
[BMFT-FB-W-78-12] N80-11982
PHOTOMETERS
Appendix D: Spectral discriminators and detectors for shuttle lidar
N80-11428
PHOTOMETRY
Raster-scan display photometric noise measurement
[AD-A073024] N80-11308
Space research in the Netherlands, 1978
N80-11996
PHOTONICS
Special session on streak camera dynamic range measurement definition
[UCRL-81704] N80-11408
PHOTONS
Isotope separation by laser-induced photomigration --- boron chlorides
[LA-TR-78-36] N80-11882
PHOTOVOLTAIC CELLS
Night storage and backup generation with electrochemical engines --- study of electric generators for electrochemical engines using photovoltaic energy conversion
[LA-UR-78-1149] N80-11596
Maximum power trackers for photovoltaic arrays
[COO-4094-17] N80-11627
PHOTOVOLTAIC CONVERSION
Conversion of radiant energy into chemical energy
[UCRL-TRANS-11427] N80-11609
PHYSICAL EXERCISE
Hypothermia induced by chlorpromazine or L-tryptophan effects on treadmill performance in the heat
[AD-A069849] N80-11764
Cold air inhalation, esophageal temperature lung function in exercising humans
[AD-A069510] N80-11765
PIEZOELECTRIC CRYSTALS
Ceramic piezoelectric transducers
[AD-A071652] N80-11334
PIEZOELECTRIC TRANSDUCERS
Ceramic piezoelectric transducers
[AD-A071652] N80-11334
Production Engineering Measure [PEM] manufacturing methods and technology for piezoelectric transformers
[AD-A072674] N80-11343
PILOT ERROR
Aircraft accident report - United Airlines, Inc., McDonnell-Douglas DC-8-61, N8082U, Portland, Oregon, December 28, 1978
[NTSB-AAR-79-7] N80-11051
PILOT PERFORMANCE
Application of modified profile analysis to function testing of simulated CTOL transport touchdown-performance data
[NASA-TP-1541] N80-11069
In-flight performance evaluation of experimental information
[AD-A071701] N80-11084
The scope, limits, and training implications of three models of aircraft pilot emergency response behavior
[AD-A071320] N80-11773
PILOT SELECTION
Rotary wing proficiency-based Aviator Selection System [PASS]
[AD-A069838] N80-11774
PILOT TRAINING
Rotary wing proficiency-based Aviator Selection System [PASS]
[AD-A069838] N80-11774
PILOTS [PERSONNEL]
Aircrew displays and avionics for application in a future national airspace system
[NASA-TM-80095] N80-11052
PIPE FLOW
Further observations on transition in a pipe
[AD-A071909] N80-11378
Application of implicit numerical methods to problems in two-phase flow
[NUREG-CR-0763] N80-11383
PIPES [TUBES]
Mach 130 air shock attenuation studies --- outlet pipes
[UCRL-82012] N80-11043
Explosive forming of butt welded pipe reducers
[AD-A072430] N80-11475
Experimental electro-thermal method for nondestructively testing welds in stainless steel pipes
[HEDL-SA-1705] N80-11497
Discontinuous deformation gradients in the finite twisting of an incompressible elastic tube
[AD-A071728] N80-11507
Response of a double tube sheet structure to hydraulic pressure transients
[DP-MS-78-73] N80-11519
PITCH [INCLINATION]
A comparison of the pitching and plunging response of an oscillating airfoil
[NASA-CR-3172] N80-11030
PITOT TUBES
Pitot pressure and total temperature profile measurements in a hypersonic, turbulent boundary layer at M = 9
[IC-AERO-79-01] N80-11048
PLANKTON
Environmental studies of the South Texas continental shelf, 1976 - 1977. Historical zooplankton
[PB-296646/3] N80-11754
PLASMA CONTROL
A study of reversed field pinch experiments using a new programming mode
[IPPJ-415] N80-11904
Magnetic mirror fusion research at the Lawrence Livermore Laboratory
[UCRL-82318] N80-11908
Stability theory for internal ring configurations
[LA-7618-MS] N80-11909
Stability of field reversed mirrors
[COO-2218-119] N80-11910
Progress in RINGBOOK 2, TORTUR 2 and SPICA 2 for 1978
N80-11920
On the boundary layer between a flowing plasma and a magnetic field. Part 1. The conditions for equilibrium
[CRPE-NT-63-PT-1] N80-11921
PLASMA CORE REACTORS
Argon/UF6 plasma exhaust gas reconstitution experiments using preheated fluorine and on-line diagnostics --- fissioning uranium plasma core reactor design
[NASA-CR-159158] N80-11906
PLASMA DECAY
The oscillating two stream and parametric decay instabilities in a weakly magnetized plasma
[AD-A072396] N80-11907
PLASMA DENSITY
Density fluctuations in a plasma chamber
[BMFT-FB-W-77-48] N80-11913
PLASMA DYNAMICS
On the balance equation for angular momentum in a plasma
[REPT-1670] N80-11917
PLASMA HEATING
Direct comparison between circularly and linearly polarized RF field in ICRF heating of a toroidal plasma
[IPPJ-416] N80-11905
Resonance and cut-off surfaces in the ion cyclotron frequency range in toroidal geometry
[TRITA-PFU-79-04] N80-11916
PLASMA PHYSICS
Use of Spacelab for the solution of terrestrial plasma research problems
[BMFT-FB-W-78-08] N80-11114
Inductively coupled plasma-atomic emission spectroscopy: An evaluation of the use of nitrogen-argon admixtures as plasma discharge atmospheres
N80-11177
Progress in RINGBOOK 2, TORTUR 2 and SPICA 2 for 1978
N80-11920
PLASMA PINCH
A study of reversed field pinch experiments using a new programming mode
[IPPJ-415] N80-11904
Parameter calculation of a screw-pinch reactor with elongated cross-section
[REPT-79-117] N80-11919
PLASMA WAVES
The oscillating two stream and parametric decay instabilities in a weakly magnetized plasma
[AD-A072396] N80-11907
PLASMA-ELECTROMAGNETIC INTERACTION
The oscillating two stream and parametric decay instabilities in a weakly magnetized plasma
[AD-A072396] N80-11907
PLASMA-PARTICLE INTERACTIONS
Density fluctuations in a plasma chamber
[BMFT-FB-W-77-48] N80-11913
PLASMAS [PHYSICS]
Radio communication utilizing the base of a striated barium plasma
[AD-A072167] N80-11299
Non-neutral field-aligned current sheet and auroral electric field
[AD-A072852] N80-11687
Connections between comets and plasmas in space
N80-11974
PLASTIC DEFORMATION
On the damping effect in surface plastic deformation --- metal working techniques
N80-11021
Large deformation elastic-plastic buckling analysis of spherical caps with initial imperfections
[AD-A071480] N80-11509
Nonlinear dynamic buckling of spherical caps with initial imperfections
[AD-A071450] N80-11514
PLASTIC PROPERTIES
Structural related research --- physicochemical and mechanical properties of materials
[AD-A071416] N80-11988
PLASTIC TAPES
A method for cleaning Gude-Space D96 tape
[ESA-PSS-52/QRM-32P-ISSUE-1] N80-11156
PLATE THEORY
Study by elastic theory of the clustering of solute atoms during the early stage of solid solution decomposition --- using strain energy method martensite
[LBL-7680] N80-11880
PLATES [STRUCTURAL MEMBERS]
Development of laser welding techniques for joining armor
[AD-A072536] N80-11473
Resonators for acceleration environments
[AD-A072741] N80-11924
PLATING
Non-noble colloidal catalysts
[AD-A072757] N80-11338
PLATINUM
Platinum-substitute materials as electrocatalysts for oxygen reduction
[PB-297261/0] N80-11186
Adsorption of oxygen on Pt [111] and its reactivity to hydrogen and carbon monoxide
[AD-A072710] N80-11198
PLOTTERS
GRAFIT: A generalized graphics package
[AD-A072339] N80-11813

PLUTONIUM OXIDES
General-purpose heat source development. Phase 1: Design requirements
[LA-7385-SR] N80-11608
General-purpose heat source project space nuclear safety program and radioisotopic terrestrial safety program --- plutonium oxide
[LA-7519-PR] N80-11889
POLARIZATION
Polarization and anisotropy of the relict radiation in an anisotropic universe
[PR-486] N80-11971
POLARIZATION CHARACTERISTICS
Electromagnetic wave propagation through randomly orientated nonspherical particles. A general theory
[FUB-31-1978] N80-11322
POLARIZED ELECTROMAGNETIC RADIATION
Electromagnetic wave propagation through randomly orientated nonspherical particles. A general theory
[FUB-31-1978] N80-11322
POLLUTION
An EPA manual for organics analysis using gas chromatography-mass spectrometry
[PB-297164/6] N80-11182
POLLUTION CONTROL
Summary report on motor vehicle emissions inspection and maintenance programs for non-attainment areas in Louisiana
[PB-294979/0] N80-11648
Extended tests of Saffil aluminum filter media --- for hot gas cleanup
[PB-297567/0] N80-11652
Technical assessment of thermal DeNOx process --- for coal fired boilers
[PB-297947/4] N80-11656
Mobile bed flux force/condensation scrubbers --- air pollution control
[PB-297198/4] N80-11657
Test of fabric filtration materials
[PB-297500/1] N80-11660
National environmental/energy workforce assessment, phase 3. Composite: Environmental engineering/technology
[PB-298589/3] N80-11667
National environmental/energy workforce assessment, phase 3. Wastewater programs --- indexes to waste water education programs
[PB-298584/4] N80-11672
Removal of lagoon effluent suspended solids by a slow-rock filter
[PB-297454/1] N80-11957
A history of land application as a treatment alternative
[PB-298227/0] N80-11964
POLLUTION MONITORING
Kinetic studies of gas mixtures and their application to gas lasers and pollutant detection
[CONF-781113-6] N80-11637
Analysis of organic pollutants by synchronous luminescence spectrometry
[CONF-781039-8] N80-11638
Implementation plan for the determination of the atmospheric contribution of petroleum hydrocarbons to the oceans
[WMO-504] N80-11644
A field study of the relationship between heavy metal concentrations in stream water and selected benthic macroinvertebrate species
[PB-297284/2] N80-11651
USPHS/NIOSH membrane filter method for evaluating airborne asbestos fibers
[PB-297731/2] N80-11663
True-integrating environmental noise monitor and sound exposure level meter. Volume 2: Wiring and parts lists, parts layouts, and schematics
[AD-A072002] N80-11871
Sampling and analysis of the aquatic environment in POTW's and their vicinity
[PB-297606/6] N80-11963
POLYBENZIMIDAZOLE
High flux PBI reverse osmosis membranes for desalination and water reuse
[PB-297285/9] N80-11184
POLYIMIDE RESINS
Development and fabrication of bismaleimide-graphite composites
[NASA-CR-152324] N80-11141
POLYMER MATRIX COMPOSITE MATERIALS
Determination of loads and stress in composite material layers for a plate in the plane stress state
N80-11023
Potential chemical systems for intramolecular cycloaddition cures
[AD-A072526] N80-11152
Materials program for fiber composite flywheels
[UCRL-81724] N80-11618
POLYMETHYL METHACRYLATE
Thermal expansion of glasses at low temperatures --- fused silica and polymethyl methacrylate
[IS-T-829] N80-11234
POLYNOMIALS
Method of moments as the least squares solution for fitting a polynomial
[AD-A072357] N80-11845
POPULATIONS
A study of sequential procedures for estimating the larger mean
[AD-A072595] N80-11857
POROSITY
Effect of thermally induced porosity on an as-HIP powder metallurgy superalloy
[NASA-TM-79263] N80-11189
POROUS MATERIALS
Gas flow through porous barriers
[LBL-8283] N80-11388
PORTABLE EQUIPMENT
An investigation of portable electromagnetic pulse simulators/alternate simulators
[AD-A071342] N80-11292
POSITRON ANNIHILATION
Direct photon emission in positron electron annihilation processes
[PM/79/9] N80-11887
POSITRONS
Tests of strong, electromagnetic interactions and weak interactions with positron electron collisons
[PM/79/8] N80-11886
POTABLE WATER
National environmental/energy workforce assessment. Phase 3: Potable water programs --- indexes to potable water education programs
[PB-298583/6] N80-11665
National environmental/energy workforce assessment, phase 3. Water/wastewater programs --- directory of courses available
[PB-298588/5] N80-11666
POTENTIOMETERS [INSTRUMENTS]
Indirect microbial detection
[NASA-CASE-LAR-12520-1] N80-11756
POTOMAC RIVER VALLEY [MD-VA-WV]
Biochemical studies of the Potomac estuary, summer 1978
[PB-297394/9] N80-11752
POWDER METALLURGY
Effect of thermally induced porosity on an as-HIP powder metallurgy superalloy
[NASA-TM-79263] N80-11189
POWER AMPLIFIERS
High average power broadband electron-bombarded semiconductor EBS amplifier
[AD-A072533] N80-11331
Feasibility demonstration of a high power wideband TWT with low AM/PM distortion
[AD-A072932] N80-11342
POWER CONDITIONING
Heat pipe cooling of power processing magnetics
[NASA-TM-79270] N80-11327
POWER LINES
Comparison of polymer flammabilities and a determination of the loss of fire retardant additives with aging
[SAND-79-0978C] N80-11230
POWER PLANTS
Heber geothermal demonstration power plant
[EPRI-ER-863] N80-11607
POWER SPECTRA
Program PSD: Digital determination of power spectral densities of random signals
[CSIR-ME-1594] N80-11276
Optical power spectrum analysis of processed imagery
[AD-A073083] N80-11335
POWER SUPPLY CIRCUITS
Unconventional circuits for static voltage transformers
[BMFT-FB-T-78-26] N80-11368
PRECIPITATION [CHEMISTRY]
On-line tests of organic additives for the inhibition of the precipitation of silica from hypersaline geothermal brine. 2: Tests of nitrogen-containing compounds, silanes, and additional ethoxylated compounds
[UCID-18195] N80-11567
PRECIPITATION [METEOROLOGY]
The depth of the marine layer at San Diego as related to subsequent cool season precipitation episodes in Arizona
[PB-298817/8] N80-11742
PREDICTION ANALYSIS TECHNIQUES
Prediction of helicopter rotor downwash in hover and vertical flight
[ARL-AERO-REPT-150] N80-11032
Improved methods for predicting spectrum loading effects, phase 1 report. volume 2: Test data
[AD-A072387] N80-11070
Prediction of lateral aerodynamic loads on fighter aircraft at high angles of attack
[AD-A071893] N80-11073
A method for evaluating aircraft take-off performance
[REPT-1663] N80-11076
Predicting solar energy fluxes in polluted urban areas
[UCRL-82080] N80-11698
PREMIXED FLAMES
Nonisenthalpic interaction of a planar premixed laminar flame with a parallel end wall
[AD-A071858] N80-11160
PRESSES
Structural analysis of a 15,000 tons 'O' press
N80-11484
PRESSURE
Ballooning beta limit of a non-circular small-aspect-ratio Tokamak
[IPPJ-413] N80-11902
PRESSURE DISTRIBUTION
Solution of the inverse aerodynamics problem by the random search method
N80-11013
Fuselage and nozzle pressure distributions on a 1/12-scale F-15 propulsion model at transonic speeds --- conducted in langley 16 foot transonic tunnel
[NASA-TP-1521] N80-11036
Wind loads on flat plate photovoltaic array fields
[NASA-CR-162424] N80-11563
PRESSURE EFFECTS
Electrical properties of solid insulators as a function of temperature and pressure --- submarine telephone cables
[PUBL-364] N80-11364
Response of a double tube sheet structure to hydraulic pressure transients
[DP-MS-78-73] N80-11519
Experimental enthalpies for a mixture of 80 mole percent isobutane in isopentane
[EPRI-ER-1034] N80-11935
PRESSURE GAGES
Evaluation of commercially available submersible pressure gauges
[AD-A071481] N80-11401
Quartz resonator pressure gauge: Design and fabrication technology
[SAND-78-2264] N80-11403
PRESSURE GRADIENTS
The effect of pressure gradient and external turbulence on heat transfer to a cold flat plate
[VKI-TN-128] N80-11396
PRESSURE MEASUREMENTS
Measurements on a three-dimensional swept wing at low speeds. Part 1: The flow around the leading edge
[FFA-130-PT-1] N80-11044
Measurements on a three-dimensional swept wing at low speeds. Part 2: The flow in the boundary layer on the main wing
[FFA-131-PT-2] N80-11045
Development and testing of equipment for aerological measurements on board small rockets and air-dropped objects
[BMFT-FB-W-78-11] N80-11702
PRESSURE VESSELS
Stress-rupture life of Kevlar/epoxy spherical pressure vessels
[UCID-17755-PT-3] N80-11515
PRIMARY COSMIC RAYS
Isotopic composition of primary cosmic ray nitrogen and oxygen with consequences for source models
[LUIP-7811] N80-11986
PRINTED CIRCUITS
Non-noble colloidal catalysts
[AD-A072757] N80-11338
Deleterious effect of fusing fluids on printed wiring boards
[AD-A072716] N80-11341
Electrical compensation system for plated-through-hole tester: Milestone Report
[BDX-613-1943-REV] N80-11354
Effects of gas plasma on printed circuit board materials
[BDX-613-2030-REV] N80-11357
PRINTERS [DATA PROCESSING]
Pluviometric data printer
[FUB-25-1978] N80-11735
PROBABILITY DENSITY FUNCTIONS
Inference under order and smoothness restrictions with applications in time series analysis
[AD-A072594] N80-11858
Another versatile family of probability distributions
[AD-A072406] N80-11859
Evaluation of nuclear power plant siting by probabilistic assessment of environmental impact
[VTT-EN-24] N80-11891
PROBABILITY DISTRIBUTION FUNCTIONS
Another versatile family of probability distributions
[AD-A072406] N80-11859
PROBABILITY THEORY
Remainder term estimates in one and many-dimensional renewal theory
N80-11861
PROBLEM SOLVING
Intelligence as an information processing concept
[AD-A069953] N80-11775
The use of computers in solving mathematical problems, volume 2. A bibliography with abstracts
[NTIS/PS-79/0798/3] N80-11799
FORTRAN subroutines for M estimators in the linear model
[AD-A071744] N80-11815
On the regularity and approximation of the solutions of some optimal control problems governed by elliptic equations
[CSIR-TWISK-47] N80-11842
PROCESS CONTROL [INDUSTRY]
Semiconductor technology program, progress briefs
[PB-298064/7] N80-11371
Semiconductor technology program, progress briefs
[PB-298063/9] N80-11372
PRODUCTION ENGINEERING
The 84-inch propellant grains
[AD-A071961] N80-11240

Economics of gasoline production from underground coal gasification via mobil-M process
[CONF-790405-12] N80-11246
Production Engineering Measure [PEM] manufacturing methods and technology for piezoelectric transformers
[AD-A072674] N80-11343
Quartz resonator pressure gauge: Design and fabrication technology
[SAND-78-2264] N80-11403
The automated array assembly task of the low-cost silicon solar array project, phase 2
[NASA-CR-162429] N80-11562
Phase 2 of the array automated assembly task for the low cost silicon solar array project
[NASA-CR-162426] N80-11565
Quantitative synthesis of multiple loop feedback systems with large plant uncertainty
[AD-A072644] N80-11833

PROFILE METHOD [FORECASTING]
Application of modified profile analysis to function testing of simulated CTOL transport touchdown-performance data
[NASA-TP-1541] N80-11069
MEDEE 2: A model for long term energy demand evaluation
[IIASA-RR-78-17] N80-11554
Directions to improve urban travel demand forecasting: Conference summary and white papers
[PB-297409/5] N80-11959

PROGNOSIS
Early diagnosis of decompression sickness. Changes in the blood found shortly after decompression. Experiments on rats
[MBL-1978-7] N80-11758

PROGRAM VERIFICATION [COMPUTERS]
Validation of software reliability models
[AD-A072113] N80-11810

PROJECT MANAGEMENT
Analysis of financial programs for energy conservation: Market simulation [penetration] model
[HCP/M8662-1] N80-11606

PROJECT PLANNING
Solar power satellite system definition study, phase 2.
[NASA-CR-160377] N80-11121
Solar power satellite system definition study, phase 2. Part 1: Midterm briefing
[NASA-CR-160378] N80-11122
Scientific returns from a program of space missions to comets
N80-11977

PROPAGATION
On the determination of arrival times for sound ranging. 1: Effects of finite amplitude propagation, vertical meteorological gradients, and system transient response --- atmospheric propagation effects of sound waves and shock waves in sound ranging
[AD-A072600] N80-11874

PROPELLANT CASTING
The 84-inch propellant grains
[AD-A071961] N80-11240

PROPELLANT GRAINS
The 84-inch propellant grains
[AD-A071961] N80-11240
Naval sea system command research and exploratory development, 1978 --- solid propellant rocket engines and solid rocket propellants
[AD-A071875] N80-11241

PROPELLER BLADES
Aircraft control by propeller cyclic blades
[NASA-CR-3212] N80-11031

PROPORTIONAL COUNTERS
Small conductive particle sensor
[NASA-CASE-LAR-12552-1] N80-11400

PROTECTIVE CLOTHING
Height/weight sizing programs for womens protective garments
[AD-A072376] N80-11781

PROTECTIVE COATINGS
Corrosion resistant thermal barrier coating --- protecting gas turbines and other heat engine parts
[NASA-CASE-LEW-13088-1] N80-11142
The response of coated steels to cavitation in corrosive environments
[AD-A072841] N80-11200

PROTON ENERGY
Similarities and differences between electron and proton transfers at electrodes and in solution
[AD-A073001] N80-11162

PROTOTYPES
An experimental apparatus for investigating the kinetic reactions in solid rocket nozzles --- reaction kinetics of carbon-carbon composite prototype rocket nozzles
[AD-A071318] N80-11138

PUBLIC HEALTH
Analysis of the exposure levels and potential biological effects of the PAVE PAWS radar system
[AD-A072332] N80-11302

PUBLIC LAW
Solar access law. Protecting access to sunlight for solar energy systems
[PB-296532/5] N80-11633

PUBLIC RELATIONS
Lack of accountability in Government public information and publishing programs
[GPO-45-775] N80-11943

PULMONARY FUNCTIONS
Cold air inhalation, esophageal temperature lung function in exercising humans
[AD-A069510] N80-11765

PULSE AMPLITUDE
A simple pulse peak detector
[RAE-TM-DW-10] N80-11369

PULSE COMMUNICATION
Enhancement and bandwidth compression of noisy speech
[AD-A073139] N80-11305
Self-phase modulation and transmission in optical fibers
[FUB-23-1978] N80-11318
Radio-wave propagation investigations on a digital radio link at 2.2 GHz
[FOA-A-30020-E2] N80-11325

PULSE DURATION
Self-phase modulation and transmission in optical fibers
[FUB-23-1978] N80-11318
Long pulse technology Tokamak
[CONF-780966] N80-11911

PULSE GENERATORS
Nanosecond pulsers for MM wave tubes
[AD-A071414] N80-11333
LASL program in nuclear pumped liquid lasers
[LA-UR-78-3016] N80-11446

PULSE MODULATION
A loop for tracking the frequency of a pulsed sinusoid
[AD-A072750] N80-11340

PULSED LASERS
Appendix B: Lasers of potential use for shuttle lidar
N80-11426
Laser deflection analysis
[AD-A072560] N80-11432
Dye lasers. Citations from the international aerospace abstracts data base
[NTIS/PS-79/0823/9] N80-11460

PUNCHED CARDS
Radar detection calculations with the HP-65 and HP-67
[AD-A071609] N80-11281

PURITY
The effect of crystal growth direction on the energy resolution of high-purity germanium detectors --- radiation detectors
[LBL-8133] N80-11928

Q

QUADRUPOLE NETWORKS
On the use of a semi-automated test system for measuring the characteristics and/or the 'S' parameters of a quadrupolar network
[CNES-NT-87] N80-11363

QUALITY CONTROL
HPLC monitoring of graphite-epoxy prepreg aging
[AD-A072294] N80-11150
The relationship between distortion and image quality: Sampling procedures and accuracy
[FUB-51-1977] N80-11317
Comparison of some instrumental variable methods. Consistency and accuracy aspects
[UPTEC-78-88-R] N80-11499
Development of the statistical pattern recognition methodology and its application to quality control
[ENST-D-78023] N80-11500
Software and procedures for statistical quality control
[ENST-D-79006] N80-11501
Proceedings of the 28th Meeting of the Mechanical prevention group, Report on MFPG detection, diagnosis, and prognosis
[NASA-TM-80881] N80-11502

QUANTITATIVE ANALYSIS
Comparison of boundary layer calculation for a wing: The May 1978 Stocholm workshop test case --- computerized simulation
[FFA-AE-1522] N80-11046
Metallic wear particles: A short review
[UPTEC-78-11-R] N80-11480

QUANTUM ELECTRODYNAMICS
Tests of strong, electromagnetic interactions and weak interactions with positron electron collisons
[PM/79/8] N80-11886

QUANTUM MECHANICS
Vertex function and crossing symmetry --- quantum mechanical many body problem
[CSIR-TWISK-53] N80-11841

QUARTZ CRYSTALS
Resonators for acceleration environments
[AD-A072741] N80-11924

QUARTZ TRANSDUCERS
Quartz resonator pressure gauge: Design and fabrication technology
[SAND-78-2264] N80-11403

QUEUEING THEORY
Information theoretic approximations for M/G/1 and G/G/1 queuing systems
[AD-A072338] N80-11831

R

RADAR ANTENNAS
Analysis of the exposure levels and potential biological effects of the PAVE PAWS radar system
[AD-A072332] N80-11302
Radiation intensity of the PAVE PAWS radar system
[AD-A072333] N80-11303

RADAR BEACONS
Evaluation of transponder antenna coverage/ATCRBS during simulated flights of aircraft
[AD-A073547] N80-11275

RADAR BEAMS
Radiation intensity of the PAVE PAWS radar system
[AD-A072333] N80-11303

RADAR ECHOES
Radar echo organization and development in the mesoscale environment: A case study approach
[PB-298444/1] N80-11714

RADAR EQUIPMENT
Radar detection calculations with the HP-65 and HP-67
[AD-A071609] N80-11281

RADAR MEASUREMENT
Analysis of tropospheric effects at low elevation angles
[AD-A073089] N80-11691

RADAR RECEIVERS
Test procedure for C-band noncoherent radar transponder
[AD-A072069] N80-11286

RADAR SIGNATURES
Space-time signal processing of radar returns
[AD-A072751] N80-11310

RADAR TRACKING
On surface-based adve... e radar ducts
[AD-A071454] N80-11289
Accuracy validation of the modified Nike Hercules radar
[AD-A071720] N80-11291

RADAR TRANSMITTERS
Test procedure for C-band noncoherent radar transponder
[AD-A072069] N80-11286

RADIAL FLOW
Off-design performance prediction of radial inflow turbines, volume 2
N80-11479
On the off-design performance of small radial turbines
N80-11485

RADIAL VELOCITY
The measurement of stellar radial velocity by optical correlation
[PUBL-SER-B-FASC-6] N80-11970

RADIATION
Conversion of radiant energy into chemical energy
[UCRL-TRANS-11427] N80-11609

RADIATION ABSORPTION
Electron and proton absorption calculations for a graphite/epoxy composite model --- large space structures
[NASA-TP-1568] N80-11226

RADIATION DAMAGE
Laser induced damage in fluoride glasses: A status report
[UCRL-81358] N80-11455
Electron radiation damage of [AlGa] As-GaAs solar cells
[NASA-CR-162425] N80-11564
Radiation effects in optical emitters and receivers
[SAND-78-1798] N80-11899

RADIATION DETECTORS
Deep level transient spectroscopy of high purity germanium diodes/detectors
[LBL-8140] N80-11176
The effect of crystal growth direction on the energy resolution of high-purity germanium detectors --- radiation detectors
[LBL-8133] N80-11928

RADIATION DOSAGE
A combined TLD/emulsion method of sampling dosimetry applied to Apollo missions
[NASA-CR-160367] N80-11985

RADIATION EFFECTS
Laser induced fluorescence extension to non-fluorescent materials
[UCRL-81837] N80-11454
Summary of radiobiological findings: From space-flight to ground-based studies
N80-11768

RADIATION HAZARDS
Analysis of the exposure levels and potential biological effects of the PAVE PAWS radar system
[AD-A072332] N80-11302
National environmental/energy workforce assessment, phase 3. Radiation programs --- indexes on radiation protection education programs
[PB-298585/1] N80-11673
Calculated linear energy transfer spectra of HZE particles for the free flyer Biostack experiment on the LDEF-mission
N80-11767

RADIATION MEDICINE
Summary of radiobiological findings. From spaceflight to ground-based studies
N80-11768

RADIATION PRESSURE
Scientific need for a cometary mission
N80-11973

RADIATION PROTECTION
National environmental/energy workforce assessment, phase 3. Radiation programs --- indexes on radiation protection education programs
[PB-298585/1] N80-11673

RADIATIVE HEAT TRANSFER
Radiative and free convective heat transfer from a containerless sphere
[NASA-TM-78249] N80-11377

RADIO ALTIMETERS
F-4 radar altimeter aural warning
[AD-A072870] N80-11085
Solid-state X-band combiner study
[NASA-CR-162432] N80-11328

RADIO ASTRONOMY
Antenna of the space radiotelescope KRT-3
[NASA-TM-75714] N80-11280
Summary of radiobiological findings. From spaceflight to ground-based studies
N80-11768

RADIO DIRECTION FINDERS
FALCONFIX: A multi-modal approach to fix computation --- algorithm for determining bearing from radio direction finders
[AD-A072527] N80-11059

RADIO FREQUENCIES
Distributed source generation for RF environmental modeling for hardware-in-the-loop missile guidance simulation
[AD-A072927] N80-11126
Prospects and limitations for use of frequency spectrum from 40 to 300 GHz
[NASA-TM-80812] N80-11272

RADIO RECEIVERS
A model for estimating radiowave acquisition receiving system intercept probability
[AD-A072503] N80-11304

RADIO RECEPTION
Satellite broadcasting: Results of a preliminary coverage survey in the UK
[BBC-RD-1979/18] N80-11270

RADIO TELESCOPES
Antenna of the space radiotelescope KRT-3
[NASA-TM-75714] N80-11280

RADIO TRANSMISSION
Radio communication utilizing the base of a striated barium plasma
[AD-A072167] N80-11299
Characterization of wave scattering from rainfall, with particular reference to the possible interference in earth-satellite-earth links at frequencies above 10 GHz
[FUB-26-1978] N80-11319
Radio communications at extremely high frequencies: The use of meteorological data
[FUB-27-1978] N80-11320
Radio-wave propagation investigations on a digital radio link at 2.2 GHz
[FOA-A-30020-E2] N80-11325

RADIOACTIVE ISOTOPES
General-purpose heat source project space nuclear safety program and radioisotopic terrestrial safety program --- plutonium oxide
[LA-7519-PR] N80-11889

RADIOACTIVE WASTES
Limitations to the use of two-dimensional thermal modeling of a nuclear waste repository
[UCID-18101] N80-11888

RADIOBIOLOGY
Discrete multivariate analysis on radiobiological results from the biostack 3 Bacillus subtilis experiment
N80-11759

RADIOMETERS
Spectral radiometric measurement and analysis program. Volume 4: SCAT3 operator's manual
[AD-A072081] N80-11720
Spectral radiometric measurement and analysis program. Volume 3: Data analysis and formulation of the model
[AD-A072080] N80-11721
Spectral radiometric measurement and analysis program. Volume 1: Description of mobile radiometric laboratory system
[AD-A072078] N80-11722

RAIN
Concepts for 18/30 GHz satellite communication system, volume 1
[NASA-CR-159625-VOL-1] N80-11277
Concepts for 18/30 GHz satellite communication system, volume 1A: Appendix
[NASA-CR-159625-VOL-1A] N80-11278
Concepts for 18/30 GHz satellite communication system study. Executive summary
[NASA-CR-159680] N80-11279

RAIN GAGES
Radio communications at extremely high frequencies: The use of meteorological data
[FUB-27-1978] N80-11320
Pluviometric data printer
[FUB-25-1978] N80-11735

RAINDROPS
Characterization of wave scattering from rainfall, with particular reference to the possible interference in earth-satellite-earth links at frequencies above 10 GHz
[FUB-26-1978] N80-11319
Precipitation and multipath effects on propagation phenomena. System characteristics and transmission quality of numerical radio links with and without frequency reuse
[FUB-29-1978] N80-11321
Electromagnetic wave propagation through randomly orientated nonspherical particles. A general theory
[FUB-31-1978] N80-11322

RAMAN SPECTRA
Resonance Raman spectra of metal halide vapor complexes
[CONF-780941-8] N80-11175

RAMAN SPECTROSCOPY
Local turbulence properties in flames from time-averaged Raman spectroscopy measurements
[SAND-78-1263C] N80-11171
Optically pumped far infrared lasers
[AD-A071836] N80-11434
Laser physics and laser techniques
[AD-A072009] N80-11435

RANDOM ACCESS MEMORY
MNOS boram manufacturing methods and technology project
[AD-A071413] N80-11922

RANDOM NUMBERS
RAVAGE. A subroutine library for computer generation of random numbers, random variables, random vectors and stochastic processes
[SMD-MITT-39] N80-11820

RANDOM SAMPLING
Optimal feedback control laws using random sampling of the observation
[CSIR-TWISK-63] N80-11827

RANDOM SIGNALS
Program PSD: Digital determination of power spectral densities of random signals
[CSIR-ME-1594] N80-11276

RANDOM VARIABLES
Optimal object control with worst random parameter distribution
N80-11016
RAVAGE. A subroutine library for computer generation of random numbers, random variables, random vectors and stochastic processes
[SMD-MITT-39] N80-11820
On the lengths of the pieces of a stick broken at random
[CTH-MATH-1979-13] N80-11860

RANDOM WALK
Remainder term estimates in one and many-dimensional renewal theory
N80-11861

RANGE [EXTREMES]
Special session on streak camera dynamic range measurement definition
[UCRL-81704] N80-11408

RANGEFINDING
Accuracy validation of the modified Nike Hercules radar
[AD-A071720] N80-11291

RANKING
A porcine bioassay method for analysis of thermally protective fabrics: A clinical grading system
[AD-A069202] N80-11766
Aspects of a multi-criterion secretary problem
[CSIR-TWISK-42] N80-11835

RARE EARTH COMPOUNDS
Low temperature heat capacity studies on hydrogen absorbing intermetallic compounds
[IS-M-210] N80-11203

RARE EARTH ELEMENTS
LASL program in nuclear pumped liquid lasers
[LA-UR-78-3016] N80-11446

RARE GASES
Ion photofragment spectroscopy: Potential surfaces of molecular ions
[AD-A073000] N80-11879

RATS
Early diagnosis of decompression sickness. Changes in the blood found shortly after decompression. Experiments on rats
[MBL-1978-7] N80-11758

RAY TRACING
Analysis of tropospheric effects at low elevation angles
[AD-A073089] N80-11691

REACTION KINETICS
An experimental apparatus for investigating the kinetic reactions in solid rocket nozzles --- reaction kinetics of carbon-carbon composite prototype rocket nozzles
[AD-A071318] N80-11138
Lectures on combustion theory
[COO-3077-153] N80-11170
Surface reactions of oxides of sulfur
[PB-297410/3] N80-11183
A thermogravimetric system for investigating gas-metal reactions at elevated temperatures
[MRL-R-726] N80-11187
Influence of electrolyte composition on electrode kinetics in the molten carbonate fuel cell
[CONF-781063-2] N80-11615
Molecular beam studies of ion-molecule reactions
[COO-2640-8] N80-11883
Crystal growth from the vapor phase with an inert component present
[D-268] N80-11933

REACTOR CORES
MDSFP: A computer program for elastic solution of three dimensional structures by the finite element method [LWBR development program]
[WAPD-TM-1187] N80-11816

REACTOR DESIGN
Long pulse technology Tokamak
[CONF-780966] N80-11911
Parameter calculation of a screw-pinch reactor with elongated cross-section
[REPT-79-117] N80-11919

REACTOR MATERIALS
Assessment of stress-strain data suitable for finite-element elastic-plastic analysis of shipping containers
[NUREG-CR-0481] N80-11520

REACTOR PHYSICS
Argon/UF6 plasma exhaust gas reconstitution experiments using preheated fluorine and on-line diagnostics --- fissioning uranium plasma core reactor design
[NASA-CR-159158] N80-11906

REACTOR SAFETY
Seismic safety margins research program overview
[UCRL-81884] N80-11696
Seismic safety margins research program. Phase 1, project 7: Systems analysis specifications of computational approach
[UCRL-13986-1] N80-11699
General-purpose heat source project space nuclear safety program and radioisotopic terrestrial safety program --- plutonium oxide
[LA-7519-PR] N80-11889

REACTOR TECHNOLOGY
Long pulse technology Tokamak
[CONF-780966] N80-11911

READING
Heuristics for knowledge acquisition from maps
[AD-A073126] N80-11540

REAL TIME OPERATION
Application of implicit numerical methods to problems in two-phase flow
[NUREG-CR-0763] N80-11383
Pluviometric data printer
[FUB-25-1978] N80-11735

RECEIVERS
Development and evaluation of an experimental parametric acoustic receiving array [PARRAY]
[AD-A072307] N80-11873

RECOMBINATION REACTIONS
Argon/UF6 plasma exhaust gas reconstitution experiments using preheated fluorine and on-line diagnostics --- fissioning uranium plasma core reactor design
[NASA-CR-159158] N80-11906

RECORDS
Lack of accountability in Government public information and publishing programs
[GPO-45-775] N80-11943

RECOVERABILITY
Interstimulus interval as it affects temporary threshold shift in serial presentations of loud tones
[AD-A072006] N80-11762

RECRYSTALLIZATION
Contour forming of various metals: Deformation and recrystallization characteristics
[LA-UR-78-1412] N80-11205

RECTENNAS
Solar power satellite system definition study
[NASA-CR-160368] N80-11123

RECYCLING
Water reuse and recycling. Volume 1: Evaluating
[PB-297283/4] N80-11958

REDUNDANT COMPONENTS
System reliability and component costs. A correlation of component quality, failure rate, and redundancy parameters
[ECR-79] N80-11498

REENTRY VEHICLES
Optimun shape for transpiration-cooled nosetip of a reentry vehicle
[AD-A072296] N80-11118

REFLECTING TELESCOPES
Appendix C: Transmitting and receiving optics considerations
N80-11427

REFLECTORS
Wide angle optical systems --- multispectral scanner
[NASA-CASE-MSC-18373-1] N80-11892

REFRACTION
Seismic refraction investigation of the Salton Sea geothermal area, Imperial Valley, California
[PB-296547/3] N80-11711

REFRACTORY MATERIALS
Program to discover materials suitable for service under hostile conditions obtaining in equipment for the gasification of coal and other solid fuels
[FE-1784-42] N80-11248

REGRESSION ANALYSIS
An investigation into the effects of asymmetry on robust estimates of regression
[AD-A072597] N80-11848

REGULATORS
Analytic design of regulators for variable-parameter systems
N80-11020
An approximation technique for small noise open loop control problems
[AD-A072638] N80-11849
REINFORCEMENT [STRUCTURES]
On solution of the plane problem of reinforced panels of variable stiffness
N80-11004
REINFORCING FIBERS
Engineering design handbook. Joining of advanced composites
[AD-A072362] N80-11148
Materials program for fiber composite flywheels
[UCRL-81724] N80-11618
RELATIVISTIC PLASMAS
Electric and magnetic fields of an intense pulse of relativistic electrons propagating through air
[AD-A071621] N80-11332
RELAXATION [MECHANICS]
Relaxation of Z discharge between electrodes --- using Taylor series to find final relaxation of zeta pinch magnetohydrodynamic stability
[IPPJ-414] N80-11903
RELAXATION METHOD [MATHEMATICS]
Relaxation applied to matching quantitative relational structures
[AD-A071604] N80-11808
Strip detection using relaxation
[AD-A071606] N80-11894
RELIABILITY
A Bayesian nonparametric approach to reliability
[AD-A072431] N80-11491
Renewal model of reliability for series systems - revisited
[AD-A072401] N80-11492
RELIABILITY ANALYSIS
Reliability prediction for mechanical systems
[AD-A071835] N80-11493
Validation of software reliability models
[AD-A072113] N80-11810
RELIABILITY ENGINEERING
On software reliability modeling
[AD-A072420] N80-11807
Multistate reliability models
[AD-A072303] N80-11855
REMOTE MANIPULATOR SYSTEM
Linear state feedback control of rigid-link manipulators
[UTIAS-TN-214] N80-11779
REMOTE SENSORS
Prospects and limitations for use of frequency spectrum from 40 to 300 GHz
[NASA-TM-80812] N80-11272
Study in remote sensing for land use
[AD-A071802] N80-11537
Study of temperature/moisture retrieval capabilities of DMSP/SSH sensor channels
[AD-A073144] N80-11542
Remote sensing applied to hydrology. A bibliography with abstracts
[NTIS/PS-79/0845/2] N80-11553
Space research in Sweden, 1978
N80-11993
Space research in Denmark
N80-11994
REMOTELY PILOTED VEHICLES
Intelligent bandwidth compression
[AD-A071692] N80-11283
RESEARCH
Assessment of long term research needs for coal-gasification technologies
[PB-297853/4] N80-11255
RESEARCH AND DEVELOPMENT
Supersonic Cruise Research [SCR] program publications for fiscal year 1977 through fiscal year 1979: Preliminary bibliography --- bibliographies
[NASA-TM-80184] N80-11029
Use of Spacelab for the solution of terrestrial plasma research problems
[BMFT-FB-W-78-08] N80-11114
Planning synthesis for Spacelab projects in communication and navigation
[BMFT-FB-W-78-30] N80-11116
Instrumentation developed by the Johns Hopkins University Applied Physics Laboratory for non-APL spacecraft --- technology assessment of research and development of spacecraft instruments
[AD-A072438] N80-11135
Gas generator research and development: BI-GAS process
[FE-1207-49] N80-11588
Activities report of the Image Laboratory
[ENST-D-79005] N80-11901
Activities of the Department of Solid State Physics
[UPTEC-78-08-R] N80-11931
Report on Finnish technological activities
N80-11991
RESEARCH FACILITIES
Design of safe electrical equipment for research
[LA-7597-MS] N80-11346
RESEARCH MANAGEMENT
Solar power satellite system definition study, phase 2.
[NASA-CR-160377] N80-11121
Solar power satellite system definition study, phase 2. Part 1: Midterm briefing
[NASA-CR-160378] N80-11122
Naval sea system command research and exploratory development, 1978 --- solid propellant rocket engines and solid rocket propellants
[AD-A071875] N80-11241
Biofuels: A survey
[EPRI-ER-746-SR] N80-11250
Proceedings: Solar Thermal Power User Review Panel Meeting
[SERI/TP-69-221] N80-11598
Status of information for consumers of small wind energy systems
[SERI/TP-51-158] N80-11602
Southeastern forum on appropriate technology
[PB-298796/4] N80-11965
Structural related research --- physicochemical and mechanical properties of materials
[AD-A071416] N80-11988
Support of small research projects in materials science at universities
[AD-A071940] N80-11989
RESEARCH PROJECTS
Theoretical and high energy physics
[COO-1764-342] N80-11912
RESERVOIRS
Effect of vertical scale distortion on the temperature field of a thermal-hydraulic model
[PB-297274/3] N80-11551
RESIDENTIAL AREAS
Residential sector energy forecasts, national level for 1978-electricity, natural gas, number two fuel oil and propane
[DOE/EIA-0102/50] N80-11601
RESIDUAL STRESS
Influence of multiaxial stress states, stress gradients and elastic anisotropy on the evaluation of residual stresses by X-rays
[AD-A067909] N80-11190
RESINS
Chromatography of metal ions with a triazine chelating resin
[IS-T-855] N80-11167
RESONANT FREQUENCIES
Resonance and cut-off surfaces in the ion cyclotron frequency range in toroidal geometry
[TRITA-FFU-79-04] N80-11916
RESONATORS
Resonators for acceleration environments
[AD-A072741] N80-11924
RESOURCES MANAGEMENT
An economic analysis of five selected LANDSAT assisted information systems in Oregon
[NASA-CR-162434] N80-11533
Interactive water resources planning using computer graphics
[PB-297994/6] N80-11550
National environmental/energy workshop assessment, phase 3. Energy programs --- directory of courses available
[PB-298587/7] N80-11634
National environmental/energy workforce assessment, phase 3. Water/wastewater programs --- directory of courses available
[PB-298588/5] N80-11666
RESPIRATION
Cold air inhalation, esophageal temperature lung function in exercising humans
[AD-A069510] N80-11765
RESPIRATORY PHYSIOLOGY
Carbon dioxide contributions in respiratory control
N80-11760
RESPIRATORY SYSTEM
Carbon dioxide contributions in respiratory control
N80-11760
RETINA
Spatio-temporal intergration in the visual system
[AD-A069558] N80-11780
REVERSE FIELD PINCH
A study of reversed field pinch experiments using a new programming mode
[IPPJ-415] N80-11904
Stability of field reversed mirrors
[COO-2218-119] N80-11910
REVERSED FLOW
High flux PBI reverse osmosis membranes for desalination and water reuse
[PB-297285/9] N80-11184
RHEOLOGY
Rheology of concentrated suspensions
N80-11178
RHODIUM COMPOUNDS
Magnetic anomaly in superconducting TmRa4B4
[LA-UR-78-2701] N80-11347
RIBBONS
Silicon solar cell process development, fabrication and analysis, phase 1
[NASA-CR-162427] N80-11561
RIGID STRUCTURES
Simplified inelastic analysis in helical coil heat exchanger design
[GA-A-15188] N80-11518
RIVER BASINS
Land cover classification from Landsat data: Phase 3 of a joint DOE/NASA demonstration
[AD-A071723] N80-11535
Energy development vs water quality in the upper Colorado and upper Missouri River Basins
[LA-7497-MS] N80-11641
ROADS
Analysis of pavement systems
[PB-298098/5] N80-11268
Geometrics, hydraulics, and hydrology
[PB-298102/5] N80-11269
ROBOTS
Summer research fellowship program
[NASA-CR-159153] N80-11940
ROCKET ENGINE CASES
LGM-30B, stage 2 dissected motors
[AD-A071402] N80-11139
Naval sea system command research and exploratory development, 1978 --- solid propellant rocket engines and solid rocket propellants
[AD-A071875] N80-11241
ROCKET EXHAUST
Specific spacecraft evaluation: Special report --- charged particle transport from a mercury ion thruster to spacecraft surfaces
[NASA-CR-159420] N80-11137
Measurements of turbulence parameters in a rocket engine exhaust using a laser crossed beam correlation technique
[AASU-340] N80-11140
ROCKET LAUNCHING
The 19305A GSRS missile number 1025, round number V-33
[AD-A071894] N80-11718
The 19305A GSRS missile number 1055 round number V-31
[AD-A071880] N80-11719
ROCKET NOZZLES
An experimental apparatus for investigating the kinetic reactions in solid rocket nozzles --- reaction kinetics of carbon-carbon composite prototype rocket nozzles
[AD-A071318] N80-11138
ROCKET SOUNDING
Swedish space activities during 1978
N80-11117
Development and testing of equipment for aerological measurements on board small rockets and air-dropped objects
[BMFT-FB-W-78-11] N80-11702
Aeronomical sounding rocket program. Results of the foil cloud experiment flown on the payload B1 of the National Aeronomy Program Winter Anomaly and Trace Constituents at El Aernosillo, Spain, December 1975 to February 1976
[BMFT-FB-W-78-16] N80-11703
Space research in the Federal Republic of Germany, 1978
N80-11992
Space research in Sweden, 1978
N80-11993
Space research in Denmark
N80-11994
ROTARY STABILITY
Investigation of load-induced non-sychronous whirl instabilities in rotating machinery
[AD-A071716] N80-11471
ROTARY WINGS
Prediction of helicopter rotor downwash in hover and vertical flight
[ARL-AERO-REPT-150] N80-11032
Noise of a model helicopter rotor due to ingestion of turbulence
[NASA-CR-3213] N80-11067
ROTATING DISKS
Bladed disk dynamic response --- for gas turbine rotor blades
[AD-A071975] N80-11091
ROTOR AERODYNAMICS
Characteristics of lightly loaded fan rotor blade wakes
[NASA-CR-3188] N80-11034
ROTOR BLADES [TURBOMACHINERY]
Characteristics of lightly loaded fan rotor blade wakes
[NASA-CR-3188] N80-11034
Bladed disk dynamic response --- for gas turbine rotor blades
[AD-A071975] N80-11091
ROTORS
Fracture and fatigue properties of 1Cr-Mo-V bainitic turbine rotor steels
[EPRI-NP-1023] N80-11201
RUNGE-KUTTA METHOD
Runge-Katta starters for multistep methods
[COO-2383-0053] N80-11391

S

S WAVES
Propagation of Lg waves across eastern Europe and Asia
[UCRL-52494] N80-11312
SAFETY FACTORS
Design of safe electrical equipment for research
[LA-7597-MS] N80-11346
SAMPLERS
Efficiency of aerosol collection on wires exposed in the stratosphere
[NASA-TM-81147] N80-11676

SAMPLING
The relationship between distortion and image quality: Sampling procedures and accuracy
[FUB-51-1977] N80-11317
SANITATION
Advanced methods for the treatment of domestic sewage --- at highway rest stops
[CONF-7810108-1] N80-11955
SATELLITE ANTENNAS
Analytical and experimental evaluation of two designs for a graphite/epoxy antenna feed truss for a communications satellite
[AD-A072484] N80-11151
SATELLITE ATTITUDE CONTROL
Simulation tests of an attitude control system with staggered pulses on a satellite motion stimulator
[BMFT-FB-W-78-29] N80-11130
SATELLITE NETWORKS
Concept for a worldwide civil maritime satellite communication network [MARSAT]. Operation system study
[BMFT-FB-W-77-13] N80-11313
SATELLITE OBSERVATION
Scientific objectives
N80-11415
Scientific objective 4: Meteorological data
N80-11419
Global lightning distribution at dawn and dusk for August-December 1977 as observed by the DMSD lighting detector
[AD-A071896] N80-11678
A case study of S3-2 observations in the late evening auroral oval
[AD-A072996] N80-11692
Study of the equatorward edge of the auroral oval from satellite observations
[AD-A072997] N80-11693
Shortrange forecasting through extrapolation of satellite imagery patterns. Part 1: Motion vector techniques
[AD-A073081] N80-11726
SATELLITE TELEVISION
Parabolic antenna for home receivers of the Broadcasting Satellite System
[BMFT-FB-W-78-13] N80-11314
SATELLITE TRANSMISSION
Correlation studies of protonospheric electron content over the US continent --- using ATS 6 transmissions
[AD-A073080] N80-11686
Satellite support to HIPLEX: Summary of results, 1976 - 1978
[PB-297839/3] N80-11729
SCALARS
Study of boundary structures
[AD-A071710] N80-11843
SCALE [RATIO]
Effect of vertical scale distortion on the temperature field of a thermal-hydraulic model
[PB-297274/3] N80-11551
SCHEDULING
Scheduling parallel processes without a common scheduler --- a systems analysis of computer programming and computer systems design for scheduling parallel processes
[AD-A072158] N80-11814
SCHOTTKY DIODES
Study of the electronic surface states of 3-V compounds --- study of surface properties of gallium arsenides to understand metal oxide semiconductors
[AD-A073014] N80-11925
SCIENCE
Development of a planning guide to innovation in the dissemination of scientific information
[PB-296537/4] N80-11949
SCINTILLATION
Report on Peru scintillation tests, March 1978
[AD-A072994] N80-11685
Coordinated data analysis of ONR-118 data --- ionospheric scintillation and disturbance phenomena
[AD-A073113] N80-11690
SCRUBBERS
Hot gas cleanup
[ICTIS/TR-03] N80-11647
Mobile bed flux force/condensation scrubbers --- air pollution control
[PB-297198/4] N80-11657
Economics of disposal of lime/limestone scrubbing wastes: Sludge/flyash blending and gypsum systems
[PB-297946/6] N80-11961
SEA WATER
Corrosion fatigue of a marine aluminum alloy [5456-H343] in the presence of shallow cracks
[AD-A072562] N80-11195
Laser irradiance in the sea: Theory and experiment
[AD-A072601] N80-11430
SEALERS
Exploratory research on novel ambient temperature curing techniques for adhesives, sealants and laminates
[AD-A072591] N80-11227
SEALING
Design and fabrication of elevon cove thermal protection systems for aerospace vehicles
[NASA-CR-159055] N80-11134
Glass fibre reinforced, sprayed coating for sealing thermal insulation containing asbestos
[TDB-325] N80-11237
SEALS [STOPPERS]
Development of improved abradable compressor gas path seal
[AD-A072171] N80-11474
SEARCH RADAR
Time encoded spatial display. Time-compressed display system uses solid-state components and data compression techniques for image processing, storage, and retrieval
[AD-A072128] N80-11301
SEASAT OCEAN DYNAMICS SATELLITE
SEASAT demonstration experiments with the offshore oil, gas and mining industries
[NASA-CR-162423] N80-11532
SECONDARY FLOW
Streakline flow visualization study of a horseshoe vortex in a large-scale, two-dimensional turbine stator cascade
[NASA-TM-79274] N80-11376
SEISMIC WAVES
Seismic refraction investigation of the Salton Sea geothermal area, Imperial Valley, California
[PB-296547/3] N80-11711
SEISMOGRAPHS
Synthesis of regional ground motion from western US earthquakes
[AD-A069727] N80-11682
SEISMOLOGY
Seismic safety margins research program. Phase 1, project 7: Systems analysis specifications of computational approach
[UCRL-13986-1] N80-11699
SELENIUM
Investigation of the structure of Te-Se solid solutions obtained in different gravity conditions onboard the Salyut-6 station and in the centrifuge
[D-269] N80-11934
SEMICONDUCTOR DEVICES
Detonation of explosives using semiconducting layers
[PUBL-368] N80-11252
Static elimination work stations --- to protect semiconductor devices
[BDX-613-1953-REV] N80-11355
Semiconductor technology program, progress briefs
[PB-298064/7] N80-11371
Semiconductor technology program, progress briefs
[PB-298063/9] N80-11372
An experimental apparatus for measuring the thermal absorption of GaSe sub 1-x sub x components
[ISS-T-78/17] N80-11930
SEMICONDUCTOR LASERS
Gallium arsenide lasers. Citations from the international aerospace abstracts data base
[NTIS/PS-79/0821/3] N80-11458
SEMICONDUCTORS [MATERIALS]
Semiconductor technology program, progress briefs
[PB-298064/7] N80-11371
Semiconductor technology program, progress briefs
[PB-298063/9] N80-11372
Electric current controlled liquid phase epitaxy of compound semiconductors for microwave devices --- indium phosphides
[AD-A072643] N80-11923
SENSORIMOTOR PERFORMANCE
Cognitive styles: A review of the literature
[AD-A069435] N80-11772
SENSORS
Development of critical fluidic components --- study of fluidic angular velocity sensors
[AD-A071650] N80-11379
SEPARATED FLOW
Separated flow problems within the transonic and supersonic flow regimes
[AD-A071899] N80-11042
An experimental survey of a separated region on a conical afterbody in a supersonic free stream
[FFA-TN-AU-1187] N80-11047
One dimensional design of centrifugal compressors taking into account flow separation in the impeller
[VKI-TN-129] N80-11486
SEQUENCING
Aspects of a multi-criterion secretary problem
[CSIR-TWISK-42] N80-11835
SEQUENTIAL ANALYSIS
On sequential confidence intervals for the largest normal mean
[AD-A072599] N80-11856
A study of sequential procedures for estimating the larger mean
[AD-A072595] N80-11857
SERVOMECHANISMS
A hydraulic actuator mechanism to control aircraft spoiler movements through dual input commands
[NASA-CASE-LAR-12412-1] N80-11065
SET THEORY
Observability with conic observation set
[CSIR-TWISK-59] N80-11838
SEWAGE TREATMENT
Advanced methods for the treatment of domestic sewage --- at highway rest stops
[CONF-7810108-1] N80-11955
Sampling and analysis of the aquatic environment in POTW's and their vicinity
[PB-297606/6] N80-11963
A history of land application as a treatment alternative
[PB-298227/0] N80-11964
SHAFTS [MACHINE ELEMENTS]
Investigation of load-induced non-sychronous whirl instabilities in rotating machinery
[AD-A071716] N80-11471
SHALLOW WATER
An implicit compact fourth-order algorithm for solving the shallow-water equations in conservation-law form
[CSIR-TWISK-57] N80-11531
SHELL STABILITY
Experimental study of shell stability under heating and loading
N80-11003
Load-carrying ability of cylindrical shell loaded by concentrated force acting along the generator
N80-11017
Influence of contour deformation in prebuckling state on bending stability of open cylindrical shells
N80-11025
SHELLS [STRUCTURAL FORMS]
Elastic-plastic-creep analysis of shells
[CONF-790402-16] N80-11517
SHOCK FRONTS
Connections between comets and plasmas in space
N80-11974
SHOCK RESISTANCE
Resonators for acceleration environments
[AD-A072741] N80-11924
SHOCK WAVE ATTENUATION
Mach 130 air shock attenuation studies --- outlet pipes
[UCRL-82012] N80-11043
SHOCK WAVES
Flow behind curved shock waves
[UTIAS-217] N80-11374
Effects of precursor heating on radiative and chemically reacting viscous flow around a Jovian entry body
[NASA-CR-3186] N80-11375
On the determination of arrival times for sound ranging. 1: Effects of finite amplitude propagation, vertical meteorological gradients, and system transient response --- atmospheric propagation effects of sound waves and shock waves in sound ranging
[AD-A072600] N80-11874
Perturbation method on the study of the interaction of the solar wind with comets
[INPE-1529-RPE/061] N80-11944
SHORT HAUL AIRCRAFT
Small transport aircraft technology. A report for the committee on commerce, science, and transportation, United States Senate
[NASA-TM-80813] N80-11953
SHORT TAKEOFF AIRCRAFT
Fuel minimal take-off path of jet lift VTOL aircraft, log no. C3558
N80-11066
New aircraft technology: Report on the Farnborough International Air Show
[PB-298345/0] N80-11078
SHORT WAVE RADIATION
Aeronautical sounding rocket program. Results of ground-based short wave absorption measurements performed at 38 deg northern latitude between 1967 and 1976
[BMFT-FB-W-78-22] N80-11704
SHRINKAGE
Palladium sintering: Shrinkage kinetics for a sponge powder
[SAND-78-8207] N80-11443
SIGNAL ANALYSIS
Program PSD: Digital determination of power spectral densities of random signals
[CSIR-ME-1594] N80-11276
A proposal for a nonlinear method of representation of voice signals
[FUB-33-1978] N80-11323
SIGNAL DETECTORS
A simple pulse peak detector
[RAE-TM-DW-10] N80-11369
Appendix D: Spectral discriminators and detectors for shuttle lidar
N80-11428
SIGNAL DISTORTION
The relationship between distortion and image quality: Sampling procedures and accuracy
[FUB-51-1977] N80-11317
SIGNAL ENCODING
Reduction of quantization noise in PCM speech coding
[AD-A072203] N80-11300
SIGNAL FADING
Radio-wave propagation investigations on a digital radio link at 2.2 GHz
[FOA-A-30020-E2] N80-11325
SIGNAL PROCESSING
Digital sound: Sampling-rate synchronisation by variable delay
[BBC-RD-1979/17] N80-11271
Reduction of quantization noise in PCM speech coding
[AD-A072203] N80-11300
Time encoded spatial display. Time-compressed display system uses solid-state components and data compression techniques for image processing, storage, and retrieval
[AD-A072128] N80-11301

Space-time signal processing of radar returns
[AD-A072751] N80-11310
Joint services electronics program of the Edward L. Ginzton Laboratory of Stanford University
[AD-A072766] N80-11337

SIGNAL TO NOISE RATIOS
Radar detection calculations with the HP-65 and HP-67
[AD-A071609] N80-11281

SIGNAL TRANSMISSION
Provisional message formats for the DABS/NAS interface
[AD-A073461] N80-11274

SILICA GLASS
Thermal expansion of glasses at low temperatures --- fused silica and polymethyl methacrylate
[IS-T-829] N80-11234

SILICON
Silicon solar cell process development, fabrication and analysis, phase 1
[NASA-CR-162427] N80-11561
Characterization of solar cells for space applications. Volume 10: Electrical characteristics of Spectrolab BSF, textured, 10 ohm-cm, 300 micron cells as a function of intensity, temperature and irradiation
[NASA-CR-162422] N80-11566

SILICON DIOXIDE
On-line tests of organic additives for the inhibition of the precipitation of silica from hypersaline geothermal brine. 2: Tests of nitrogen-containing compounds, silanes, and additional ethoxylated compounds
[UCID-18195] N80-11567

SIM
Pallet-only configuration improvement study: Technical summary report
[RAE-TP-7717] N80-11132

SIMULATION
Simulated Mission Endurance Test [SMET] for an aircraft engine to be used in a fighter/attack role
[AD-A071907] N80-11089

SIMULATORS
Tri-FAST hardware-in-the-loop simulation. Volume 1: Tri-FAST hardware-in-the-loop simulation at advanced simulation center
[AD-A072919] N80-11063
An investigation of portable electromagnetic pulse simulators/alternate simulators
[AD-A071342] N80-11292

SINE WAVES
A loop for tracking the frequency of a pulsed sinusoid
[AD-A072750] N80-11340

SINGLE CRYSTALS
The effect of crystal growth direction on the energy resolution of high-purity germanium detectors --- radiation detectors
[LBL-8133] N80-11928

SINGULARITY [MATHEMATICS]
Pseudosymmetric eigenmode expansion for the magnetic field integral equation and SEM consequences
[AD-A071429] N80-11297

SINTERING
Palladium sintering: Shrinkage kinetics for a sponge powder
[SAND-78-8207] N80-11443

SIRIO SATELLITE
Characterization of wave scattering from rainfall, with particular reference to the possible interference in earth-satellite-earth links at frequencies above 10 GHz
[FUB-26-1978] N80-11319

SITES
Evaluation of nuclear power plant siting by probabilistic assessment of environmental impact
[VTT-EN-24] N80-11891

SIZE [DIMENSIONS]
Specimen size considerations in fatigue-crack growth rate testing
[HEDL-TME-78-99] N80-11521

SLOT ANTENNAS
An improved theory for microstrip antennas and application, part 1
[AD-A070791] N80-11293

SLUDGE
Economics of disposal of lime/limestone scrubbing wastes: Sludge/flyash blending and gypsum systems
[PB-297946/6] N80-11961

SMOG
Smog chamber validation using Lagrangian atmospheric data
[PB-297480/6] N80-11662

SNOW
Aircraft rolling resistance in loose, dry snow: A theoretical analysis
[VTI-173-A] N80-11077
Major midwest snowstorms
[AD-A072746] N80-11723

SOCIAL FACTORS
Spatial population analysis: Methods and computer programs
[IIASA-RR-78-18] N80-11939

SODIUM
Single-electron capture into Ar + excited states in ar + Na collision below 12 keV. 2: Relative population distributed in Ar + excited states
[IPPJ-411] N80-11876

SODIUM CHLORIDES
Thermodynamics of high temperature brines
[LBL-8973] N80-11936

SOIL MECHANICS
Approximate methods for the analysis of earth penetration
[SAND-78-1748C] N80-11697
SOILST: A computer program for soil-structure interactions analysis
[GA-A-15067] N80-11700

SOIL MOISTURE
Elimination of the effect of surface microtopography in an improved soil skin moisture determinator
[AD-A072614] N80-11680

SOLAR ACTIVITY
Solar-geophysical data number 417. Part 2: Data for November 1978 - October 1978 and miscellanea
[PB-297448/3] N80-11984

SOLAR ACTIVITY EFFECTS
A climatological study on the occurrence of easterly gales on the North Atlantic Ocean
[KNMI-WR-79-5] N80-11737

SOLAR ARRAYS
The automated array assembly task of the low-cost silicon solar array project, phase 2
[NASA-CR-162429] N80-11562
Wind loads on flat plate photovoltaic array fields
[NASA-CR-162424] N80-11563
Phase 2 of the array automated assembly task for the low cost silicon solar array project
[NASA-CR-162426] N80-11565
SAMICS: Input data preparation --- Solar Array Manufacturing Industry Costing Standards
[NASA-CR-162421] N80-11570
Solar parabolic trough forming process
[ALO-4158-1] N80-11626

SOLAR CELLS
Silicon solar cell process development, fabrication and analysis, phase 1
[NASA-CR-162427] N80-11561
Electron radiation damage of [AlGa] As-GaAs solar cells
[NASA-CR-162425] N80-11564
Characterization of solar cells for space applications. Volume 10: Electrical characteristics of Spectrolab BSF, textured, 10 ohm-cm, 300 micron cells as a function of intensity, temperature and irradiation
[NASA-CR-162422] N80-11566
The dynamic response of solar cells
[CNES-NT-85] N80-11629

SOLAR COLLECTORS
Concentrating solar collector test results Collector Module Test Facility [CMTF]
[SAND-78-0977] N80-11580
Heat loss reduction techniques for annular solar receiver designs
[SAND-78-1769] N80-11581
Design considerations for a proposed passive vacuum solar annular receiver
[SAND-78-0982] N80-11582
Spectrally selective surfaces with coatings comprised of ultrafine metal particles --- solar collectors
[AED-CONF-78-212-004] N80-11620
Solar parabolic trough forming process
[ALO-4158-1] N80-11626

SOLAR CONSTANT
Comparison of extraterrestrial and earth-based solar spectral irradiance results
[CSIR-RR-342] N80-11980
Is the sun constant?
[ATR-79[9552]-4] N80-11981

SOLAR COOLING
Solar energy system installed at the North Georgia APDC office building
[NASA-CR-161273] N80-11555
Solar heating and cooling systems design and development
[NASA-CR-150873] N80-11560
Energy storage for solar air conditioning applications utilizing a form-stable, high density polyethylene pellet bed
[MLM-2598[OP]] N80-11603
Energy savings for a solar heated and cooled building through adaptive optimal control
[LA-UR-78-2986] N80-11616

SOLAR ENERGY
Solar energy system installed at the North Georgia APDC office building
[NASA-CR-161273] N80-11555
Solar commercialization
[GPO-43-586] N80-11556
Solar heating and cooling systems design and development
[NASA-CR-150873] N80-11560
Solar access law. Protecting access to sunlight for solar energy systems
[PB-296532/5] N80-11633
Predicting solar energy fluxes in polluted urban areas
[UCRL-82080] N80-11698

SOLAR ENERGY CONVERSION
Solar commercialization
[GPO-43-586] N80-11556
Concentrating solar collector test results Collector Module Test Facility [CMTF]
[SAND-78-0977] N80-11580
Proceedings: Solar Thermal Power User Review Panel Meeting
[SERI/TP-69-221] N80-11598
Status of information for consumers of small wind energy systems
[SERI/TP-51-158] N80-11602
Energy storage for solar air conditioning applications utilizing a form-stable, high density polyethylene pellet bed
[MLM-2598[OP]] N80-11603
Midtemperature Solar Systems Test Facility [MSSTF] project test results: Phase 4A MSSTF system operation
[SAND-78-1088] N80-11613
Research overview of biological and chemical conversion methods and identification of key research areas for SERI
[SERI/TR-33-067] N80-11617
Preliminary materials assessment in solar demonstration systems
[ANL/EES-CP-30] N80-11619
Maximum power trackers for photovoltaic arrays
[COO-4094-17] N80-11627
Solar energy with latent heat storage: Fundamentals and applications
[ASSA-10/1978] N80-11632

SOLAR FLUX
Solar access law. Protecting access to sunlight for solar energy systems
[PB-296532/5] N80-11633
Predicting solar energy fluxes in polluted urban areas
[UCRL-82080] N80-11698

SOLAR FLUX DENSITY
Determination of the solar photon flux in the range of from 160 to 220 nm using the photolysis of ammonia combined with nitric oxide detection
[BMFT-FB-W-78-12] N80-11982

SOLAR HEATING
Solar energy system installed at the North Georgia APDC office building
[NASA-CR-161273] N80-11555
Solar heating and cooling systems design and development
[NASA-CR-150873] N80-11560
Composition stability and degradation products of selected materials for solar heating and cooling
[SAND-78-0681] N80-11591
Energy savings for a solar heated and cooled building through adaptive optimal control
[LA-UR-78-2986] N80-11616
Investigation of the applicability of technical systems utilizing solar energy for the heat supply of buildings
[BMFT-FB-T-78-48] N80-11630
Solar energy with latent heat storage: Fundamentals and applications
[ASSA-10/1978] N80-11632

SOLAR HOUSES
An evaluation of the NASA Tech House, including live-in test results, volume 1
[NASA-TP-1564] N80-11559

SOLAR NEUTRINOS
Informal conference on Status and Future of Solar Neutrino Research; proceedings
[BNL-50879-VOL-2] N80-11890

SOLAR PHYSICS
Space research in Switzerland, 1978
N80-11995

SOLAR POWER SATELLITES
Solar power satellite system definition study, phase 2.
[NASA-CR-160377] N80-11121
Solar power satellite system definition study, phase 2. Part 1: Midterm briefing
[NASA-CR-160378] N80-11122
Solar power satellite system definition study
[NASA-CR-160368] N80-11123

SOLAR PROTONS
Determination of the solar photon flux in the range of from 160 to 220 nm using the photolysis of ammonia combined with nitric oxide detection
[BMFT-FB-W-78-12] N80-11982

SOLAR RADIATION
Space research in the Netherlands, 1978
N80-11996
Space research in Belgium, 1978
N80-11997

SOLAR RADIO EMISSION
Solar-geophysical data number 417. Part 2: Data for November 1978 - October 1978 and miscellanea
[PB-297448/3] N80-11984

SOLAR REFLECTORS
On the behaviour of heliostats in the extreme winter climate of the Swiss Mountains
[AED-CONF-78-212-001] N80-11611

SOLAR SPECTRA
Comparison of extraterrestrial and earth-based solar spectral irradiance results
[CSIR-RR-342] N80-11980

SOLAR SYSTEM
Space missions to comets
[NASA-CP-2089] N80-11972

SOLAR TERRESTRIAL INTERACTIONS
Scientific objective 7: Magnetospheric sun and weather relationships
N80-11422
Candidate shuttle lidar experiments
N80-11423
Appendix A: Descriptions of shuttle borne lidar experiments
N80-11425

SOLAR WIND
Perturbation method on the study of the interaction of the solar wind with comets
[INPE-1529-RPE/061] N80-11944
Connections between comets and plasmas in space N80-11974
Solar-geophysical data number 417. Part 2: Data for November 1978 - October 1978 and miscellanea
[PB-297448/3] N80-11984
SOLAR X-RAYS
Solar-geophysical data number 417. Part 2: Data for November 1978 - October 1978 and miscellanea
[PB-297448/3] N80-11984
SOLID PROPELLANT ROCKET ENGINES
LGM-30B, stage 2 dissected motors
[AD-A071402] N80-11139
Naval sea system command research and exploratory development, 1978 --- solid propellant rocket engines and solid rocket propellants
[AD-A071875] N80-11241
SOLID ROCKET BINDERS
Naval sea system command research and exploratory development, 1978 --- solid propellant rocket engines and solid rocket propellants
[AD-A071875] N80-11241
SOLID ROCKET PROPELLANTS
Workshop report: Fundamental reactions in solid propellant combustion --- conferences
[AD-A072162] N80-11239
SOLID SOLUTIONS
Study of metal-oxygen solid solutions utilizing solid electrolytic cells
[COO-1198-1216] N80-11210
Investigation of the structure of Te-Se solid solutions obtained in different gravity conditions onboard the Salyut-6 station and in the centrifuge
[D-269] N80-11934
SOLID STATE DEVICES
The 10 to the 8th power bit solid state spacecraft data recorder --- utilizing bubble domain memory technology
[NASA-CR-3182] N80-11136
Solid-state X-band combiner study
[NASA-CR-162432] N80-11328
Electronics research at the University of Texas at Austin
[AD-A072436] N80-11987
SOLID STATE PHYSICS
Support of small research projects in materials science at universities
[AD-A071940] N80-11989
SOLID SUSPENSIONS
Rheology of concentrated suspensions N80-11178
SOLID WASTES
Methane recovery from sanitary landfills; gas recovery system installation and testing
[PB-296622/4] N80-11254
National environmental/energy workforce assessment, phase 3. Solid waste programs --- indexes for solid wastes management education
[PB-298586/9] N80-11640
SOLITARY WAVES
Almost periodic N-soliton solutions of the nonlinear hydrodynamic Kaup equation
[PM/79/10] N80-11397
SOLUTIONS
Measurement of diffusion coefficients of short-lived species in solution and in amorphous glasses
[NVO-0535-7] N80-11236
SOLVENT EXTRACTION
Analysis of backmixing and mass transfer in solvent extraction columns
[IS-T-851] N80-11166
SOLVENTS
Crystal growth from the vapor phase with an inert component present
[D-268] N80-11933
SONAR
Acoustic phase fluctuations caused by Garrett-Munk internal waves
[AD-A071354] N80-11872
SOUND PROPAGATION
On the use of finite element method on some acoustical problems
[D4-1979] N80-11875
SOUND RANGING
On the determination of arrival times for sound ranging. 1: Effects of finite amplitude propagation, vertical meteorological gradients, and system transient response --- atmospheric propagation effects of sound waves and shock waves in sound ranging
[AD-A072600] N80-11874
SOUND TRANSDUCERS
Fiber optic detection of low frequency underwater sound
[AD-A072829] N80-11898
SOUND TRANSMISSION
Studies of the acoustic transmission characteristics of coaxial nozzles with inverted velocity profiles, volume 1 --- jet engine noise radiation through coannular exhaust nozzles
[NASA-CR-159698] N80-11870
Acoustic phase fluctuations caused by Garrett-Munk internal waves
[AD-A071354] N80-11872
SOUND WAVES
On the determination of arrival times for sound ranging. 1: Effects of finite amplitude propagation, vertical meteorological gradients, and system transient response --- atmospheric propagation effects of sound waves and shock waves in sound ranging
[AD-A072600] N80-11874
SPACE CHARGE
Space charge limited transport and bunching of non K-V beams
[AD-A072417] N80-11877
SPACE EXPLORATION
Space research in the United Kingdom N80-11998
SPACE HEATING [BUILDINGS]
The Building Loads Analysis and System Thermodynamics [BLAST] program, version 2.0. Users manual, volume 1
[AD-A072272] N80-11258
The Building Loads Analysis System Thermodynamics [BLAST] program version 2.0 Input booklet --- for predicting energy consumption based on structural size and meteorological data
[AD-A072435] N80-11259
Solar energy system installed at the North Georgia APDC office building
[NASA-CR-161273] N80-11555
Solar heating and cooling systems design and development
[NASA-CR-150873] N80-11560
Standby conservation plan no. 2: Emergency building temperature restrictions. Economic analysis
[DOE/ERA-0047] N80-11593
Energy savings for a solar heated and cooled building through adaptive optimal control
[LA-UR-78-2986] N80-11616
Investigation of the applicability of technical systems utilizing solar energy for the heat supply of buildings
[BMFT-FB-T-78-48] N80-11630
SPACE INDUSTRIALIZATION
Space Construction Automated Fabrication Experiment Definition Study. [SCAFEDS], part 3. Volume 1: Executive summary
[NASA-CR-150345] N80-11111
SPACE MANUFACTURING
Evaluation criteria for commercially oriented materials processing in space proposals
[NASA-CR-162437] N80-11112
SPACE MISSIONS
Cost-effective technology advancement directions for electric propulsion transportation systems in earth-orbital missions
[NASA-TM-79289] N80-11950
Space missions to comets
[NASA-CP-2089] N80-11972
Scientific need for a cometary mission N80-11973
Scientific returns from a program of space missions to comets N80-11977
SPACE PROBES
Space research in the Federal Republic of Germany, 1978 N80-11992
SPACE PROCESSING
Zone crystallization under zero gravity
[BMFT-FB-W-77-12] N80-11929
SPACE PROGRAMS
Space research in Switzerland, 1978 N80-11995
Space research in the Netherlands, 1978 N80-11996
SPACE SHUTTLE PAYLOADS
Shuttle atmospheric lidar program evolution N80-11424
Appendix B: Lasers of potential use for shuttle lidar N80-11426
Appendix C: Transmitting and receiving optics considerations N80-11427
Appendix D: Spectral discriminators and detectors for shuttle lidar N80-11428
SPACE SHUTTLES
Shuttle atmospheric lidar research program
[NASA-SP-433] N80-11414
Candidate shuttle lidar experiments N80-11423
Calculated linear energy transfer spectra of HZE particles for the free flyer Biostack experiment on the LDEF-mission N80-11767
SPACE SIMULATORS
Simulation tests of an attitude control system with staggered pulses on a satellite motion simulator
[BMFT-FB-W-78-29] N80-11130
SPACEBORNE EXPERIMENTS
Evaluation criteria for commercially oriented materials processing in space proposals
[NASA-CR-162437] N80-11112
Candidate shuttle lidar experiments N80-11423
Shuttle atmospheric lidar program evolution N80-11424
Appendix A: Descriptions of shuttle borne lidar experiments N80-11425
Space research in the Federal Republic of Germany, 1978 N80-11992
SPACEBORNE PHOTOGRAPHY
Observations of atmospheric dust from space N80-11529
SPACEBORNE TELESCOPES
Antenna of the space radiotelescope KRT-3
[NASA-TM-75714] N80-11280
Concept and feasibility study on a very wide angle photographic camera for Spacelab
[BMFT-FB-W-77-17] N80-11409
SPACECRAFT ANTENNAS
A multiple-beam microwave antenna based on the principle of the Mills cross
[AD-A072876] N80-11307
SPACECRAFT CHARGING
Specific spacecraft evaluation: Special report --- charged particle transport from a mercury ion thruster to spacecraft surfaces
[NASA-CR-159420] N80-11137
SPACECRAFT COMMUNICATION
Characterization of wave scattering from rainfall, with particular reference to the possible interference in earth-satellite-earth links at frequencies above 10 GHz
[FUB-26-1978] N80-11319
SPACECRAFT DESIGN
Statistical energy analysis response prediction methods for structural systems
[NASA-CR-161334] N80-11506
SPACECRAFT INSTRUMENTS
Instrumentation developed by the Johns Hopkins University Applied Physics Laboratory for non-APL spacecraft --- technology assessment of research and development of spacecraft instruments
[AD-A072438] N80-11135
SPACECRAFT POWER SUPPLIES
Heat pipe cooling of power processing magnetics
[NASA-TM-79270] N80-11327
General-purpose heat source development. Phase 1: Design requirements
[LA-7385-SR] N80-11608
SPACECREWS
STARPAHC space-oriented medical evaluation --- telemedicine system
[NASA-CR-160360] N80-11763
SPACELAB PAYLOADS
Feasibility study for selected Spacelab experiments conducted in the disciplines of earth observation and meteorology
[BMFT-FB-W-77-46] N80-11113
Use of Spacelab for the solution of terrestrial plasma research problems
[BMFT-FB-W-78-08] N80-11114
Feasibility study for the Spacelab User Program. Measurement of terrestrial noise, radio control
[BMFT-FB-W-78-14] N80-11115
Planning synthesis for Spacelab projects in communication and navigation
[BMFT-FB-W-78-30] N80-11116
Pallet-only configuration improvement study: Technical summary report
[RAE-TP-7717] N80-11132
Concept and feasibility study on a very wide angle photographic camera for Spacelab
[BMFT-FB-W-77-17] N80-11409
SPAIN
Aeronomical sounding rocket program. Results of the foil cloud experiment flown on the payload B1 of the National Aeronomy Program Winter Anomaly and Trace Constituents at El Arenosillo, Spain, December 1975 to February 1976
[BMFT-FB-W-78-16] N80-11703
SPALLATION
Impact induced tensile failures in steel
[AD-A072477] N80-11191
SPATIAL DISTRIBUTION
Spatial population analysis: Methods and computer programs
[IIASA-RR-78-18] N80-11939
SPECIFIC HEAT
Low temperature heat capacity studies on hydrogen absorbing intermetallic compounds
[IS-M-210] N80-11203
Further measurements of the specific heats at low temperatures in metallic glasses
[UCRL-13908] N80-11231
Desorption heat capacity of 3He adsorbed on solid argon
[UPTEC-78-16-R] N80-11264
Desorption heat capacity of 4He adsorbed on solid neon
[UPTEC-78-17-R] N80-11265
Description of experimental techniques used in heat capacity measurements of adsorbed helium
[UPTEC-78-18-R] N80-11266
Heat capacity of submonolayers of 3He adsorbed on solid neon
[UPTEC-78-31-R] N80-11267
SPECIFICATIONS
Space dosimetry. Volume 2: Technical appendices
[FRI-R646/3-VOL-2] N80-11413
Preparation guide for class B software specification documents
[NASA-CR-162431] N80-11805
NASA software specification and evaluation system design
[NASA-CR-161335] N80-11806

SPECTRAL CORRELATION
The measurement of stellar radial velocity by optical correlation
[PUBL-SER-B-FASC-6] N80-11970
SPECTRAL EMISSION
Spectral radiometric measurement and analysis program. Volume I: Description of mobile radiometric laboratory system
[AD-A072078] N80-11722
SPECTRAL SENSITIVITY
Spectrally selective surfaces with coatings comprised of ultrafine metal particles --- solar collectors
[AED-CONF-78-212-004] N80-11620
SPECTRAL SIGNATURES
Appendix D: Spectral discriminators and detectors for shuttle lidar
N80-11428
SPECTROPHOTOMETRY
Project Spectrostratoscope: Balloon-borne solar research
[BMFT-FB-W-78-15] N80-11983
SPECTROSCOPIC ANALYSIS
Analysis of organic pollutants by synchronous luminescence spectrometry
[CONF-781039-8] N80-11638
Ion photofragment spectroscopy: Potential surfaces of molecular ions
[AD-A073000] N80-11879
Spectrophotometry of cool stars in the near infrared. Results for a region in Cassiopeia
[ISBN-0-9025-5320-8] N80-11967
SPECTROSCOPIC TELESCOPES
Project Spectrostratoscope: Balloon-borne solar research
[BMFT-FB-W-78-15] N80-11983
SPECTROSCOPY
Deep level transient spectroscopy of high purity germanium diodes/detectors
[LBL-8140] N80-11176
Inductively coupled plasma-atomic emission spectroscopy: An evaluation of the use of nitrogen-argon admixtures as plasma discharge atmospheres
N80-11177
Comparison of spectroscopic and radiometric measurements of upper atmosphere water vapor
[PB-299072/9] N80-11713
SPECTRUM ANALYSIS
Spectral estimates of band-limited signals
[AD-A072776] N80-11306
Appendix D: Spectral discriminators and detectors for shuttle lidar
N80-11428
An investigation of a mathematical model for atmospheric absorption spectra
[NASA-CR-162430] N80-11677
A summary of spectral synthesis procedures for multivariable systems
[NASA-CR-162436] N80-11862
Infrared absorption by water clusters
[AD-A071455] N80-11895
SPEECH
Reduction of quantization noise in PCM speech coding
[AD-A072203] N80-11300
SPEECH RECOGNITION
Enhancement and bandwidth compression of noisy speech
[AD-A073139] N80-11305
The rhymed words method of measuring the intelligibility index in audiometric work. The influence of open and closed vowels
[FUB-1-1979] N80-11324
SPHERES
Radiative and free convective heat transfer from a containerless sphere
[NASA-TM-78249] N80-11377
SPHERICAL CAPS
Large deformation elastic-plastic buckling analysis of spherical caps with initial imperfections
[AD-A071480] N80-11509
SPHERICAL SHELLS
Impact induced tensile failures in steel
[AD-A072477] N80-11191
Nonlinear dynamic buckling of spherical caps with initial imperfections
[AD-A071450] N80-11514
SPHEROIDS
Spheroidal functions. Theoretical studies and computational techniques
[CNES-NT-88] N80-11819
SPIN TESTS
Lateral and tilt whirl modes of flexibly mounted flywheel systems --- for energy storage
[SAND-78-7070] N80-11622
Whirling response and stability of flexibly mounted, ring-type flywheel systems
[SAND-78-7073] N80-11623
SPINACH
Interaction of low levels of ozone and relative humidity on leafy vegetables
[PB-297062/2] N80-11658
SPOILERS
A hydraulic actuator mechanism to control aircraft spoiler movements through dual input commands
[NASA-CASE-LAR-12412-1] N80-11065
SPOKES
Hobbing ratchet wheels for miniature mechanisms
[BDX-613-1927-REV] N80-11476
SPORES
Discrete multivariate analysis on radiobiological results from the biostack 3 Bacillus subtilis experiment
N80-11759
SPRAY CHARACTERISTICS
Height of spray produced by vertical takeoff and landing [VTOL] aircraft
[AD-A073099] N80-11075
SPRAYED COATINGS
Glass fibre reinforced, sprayed coating for sealing thermal insulation containing asbestos
[TDB-325] N80-11237
SQUID [DETECTORS]
Noise and optimization of the dc SQUID
[LBL-8510] N80-11345
STABILITY TESTS
Simulation tests of an attitude control system with staggered pulses on a satellite motion stimulator
[BMFT-FB-W-78-29] N80-11130
Whirling response and stability of flexibly mounted, ring-type flywheel systems
[SAND-78-7073] N80-11623
STAINLESS STEELS
Mechanical properties and oxidation and corrosion resistance of reduced-chromium 304 stainless steel alloys
[NASA-TP-1557] N80-11188
Acoustic emission from hydrogen saturated type 304L stainless steel
[DP-MS-78-50] N80-11208
Tensile and creep properties of type 316 stainless steel
[CONF-781219-3] N80-11212
Specimen size considerations in fatigue-crack growth rate testing
[HEDL-TME-78-99] N80-11521
STANDARDIZATION
U. S. Army metrication analysis and recommendations for DA implementation plan, volume 1
[AD-A069746] N80-11256
STANDARDS
SAMICS: Input data preparation --- Solar Array Manufacturing Industry Costing Standards
[NASA-CR-162421] N80-11570
STAR DISTRIBUTION
Spectrophotometry of cool stars in the near infrared. Results for a region in Cassiopeia
[ISBN-0-9025-5320-8] N80-11967
STATIC TESTS
Fatigue testing of precipitating steel 1745 [Custom 455] with machining as the final process
[FFA-TN-HU-1965] N80-11221
STATISTICAL ANALYSIS
Statistical diagnostics aircraft engines
N80-11006
Statistical energy analysis response prediction methods for structural systems
[NASA-CR-161334] N80-11506
Design study for the development and use of model output statistics in automated aviation weather forecasting
[AD-A072849] N80-11727
STATISTICAL DISTRIBUTIONS
Bathtub and related failure rate characterizations
[AD-A072626] N80-11490
On Berry-Essen rates for statistical functions, with application to L-estimates
[AD-A072131] N80-11854
STATISTICAL TESTS
Development of the statistical pattern recognition methodology and its application to quality control
[ENST-D-78023] N80-11500
Software and procedures for statistical quality control
[ENST-D-79006] N80-11501
STATORS
The effect of interblade phase angle and solidity on the time variant aerodynamic response of a compressor stator
[AD-A071878] N80-11092
Streakline flow visualization study of a horseshoe vortex in a large-scale, two-dimensional turbine stator cascade
[NASA-TM-79274] N80-11376
STEELS
Impact induced tensile failures in steel
[AD-A072477] N80-11191
The response of coated steels to cavitation in corrosive environments
[AD-A072841] N80-11200
Fracture and fatigue properties of 1Cr-Mo-V bainitic turbine rotor steels
[EPRI-NP-1023] N80-11201
Mechanical properties of modified 9 Cr-1 Mo steel --- charpy impact, tensile, and creep tests performed on steel
[CONF-781219-2] N80-11213
Behaviour of steel under cyclic loading --- conference
[ICAF-1090] N80-11503
STELLAR ENVELOPES
Space research in Belgium, 1978
N80-11997
STELLAR EVOLUTION
Photometric properties of G, K and M stars in relation to galatic structure and evolution
[PUBL-SER-B-FASC-5] N80-11969
STELLAR RADIATION
Space research in the Netherlands, 1978
N80-11996
STELLAR SPECTROPHOTOMETRY
Spectrophotometry of cool stars in the near infrared. Results for a region in Cassiopeia
[ISBN-0-9025-5320-8] N80-11967
The measurement of stellar radial velocity by optical correlation
[PUBL-SER-B-FASC-6] N80-11970
Space Research in the Netherlands, 1977
N80-11990
STOCHASTIC PROCESSES
RAVAGE: A subroutine library for computer generation of random numbers, random variables, random vectors and stochastic processes
[SMD-MITT-39] N80-11820
Optimal feedback control laws using random sampling of the observation
[CSIR-TWISK-63] N80-11827
On the achievable accuracy in stochastic control
[UPTEC-78-23-R] N80-11834
Aspects of a multi-criterion secretary problem
[CSIR-TWISK-42] N80-11835
STORAGE STABILITY
Characterization of low density rigid urethane foam
[BDX-613-1890-REV] N80-11232
STORAGE TANKS
PRSA hydrogen tank thermal acoustic oscillation study
[NASA-CR-152319] N80-11470
Reduction of air emissions from gasoline storage tanks
[PB-297976/3] N80-11659
STORMS [METEOROLOGY]
Major midwest snowstorms
[AD-A072746] N80-11723
A climatological study on the occurrence of easterly gales on the North Atlantic Ocean
[KNMI-WR-79-5] N80-11737
STRAIN ENERGY METHODS
Study by elastic theory of the clustering of solute atoms during the early stage of solid solution decomposition --- using strain energy method martensite
[LBL-7680] N80-11880
STRAIN RATE
Strain rate effects on ultimate strain of copper
[AD-A072175] N80-11192
Explosive technique for assymmetric expansion of cylinders at high strain rates
[SAND-78-2393] N80-11261
STRATOSPHERE
Scientific objective 2: Stratospheric and mesospheric chemistry and transport
N80-11417
Efficiency of aerosol collection on wires exposed in the stratosphere
[NASA-TM-81147] N80-11676
STREAK CAMERAS
Special session on streak camera dynamic range measurement definition
[UCRL-81704] N80-11408
STRESS [PHYSIOLOGY]
Hypothermia induced by chlorpromazine or L-tryptophan effects on treadmill performance in the heat
[AD-A069849] N80-11764
Altitude acclimatization. Citations from the International Aerospace Abstracts data base
[NTIS/PS-79/0857/7] N80-11770
STRESS ANALYSIS
Determination of loads and stress in composite material layers for a plate in the plane stress state
N80-11023
Development of a realistic stress analysis for fatigue analysis of notched composite laminates
[NASA-CR-159119] N80-11146
A multilayer traction-free edge, quadrilateral, warping element for the stress analysis of composite plates and shells
[AD-A071910] N80-11508
STRESS CONCENTRATION
Load-carrying ability of cylindrical shell loaded by concentrated force acting along the generator
N80-11017
Effect of weld penetration on the stress concentration factor for cruciform welded joints
N80-11522
Stress concentration factors for fillet welded joints during bending
N80-11523
STRESS CYCLES
Influence of environmental cycling on the mechanical properties of composite materials, part 2
[FFA-TN-HU-1853.1-PT-2] N80-11155
STRESS-STRAIN DIAGRAMS
Tensile and flexural strength of non-graphitic superhybrid composites. Predictions and comparisons
[NASA-TM-79276] N80-11144
STRESS-STRAIN RELATIONSHIPS
On solution of the plane problem of reinforced panels of variable stiffness
N80-11004
Numerical integration of equations of theory of thin-wall beams with deformable contour
N80-11018
Assessment of stress-strain data suitable for finite-element elastic-plastic analysis of shipping containers
[NUREG-CR-0481] N80-11520

STRINGERS
On solution of the plane problem of reinforced panels of variable stiffness
N80-11004
STRIP TRANSMISSION LINES
An analysis of the disk microstrip antenna, part 2
[AD-A070794] N80-11294
STRUCTURAL ANALYSIS
Design of the Spar-Wingskin Joint
[AD-A072426] N80-11072
Space Construction Automated Fabrication Experiment Definition Study. [SCAFEDS], part 3. Volume 1: Executive summary
[NASA-CR-160345] N80-11111
Analysis of beryllium parts for cosmos 954
[UCRL-52597] N80-11127
Analysis and synthesis of operational loads
[RAE-LIB-TRANS-2008] N80-11504
On-line structural response analysis: Using the extended Kalman estimator/identifier
[UCID-18175] N80-11516
MDSFP: A computer program for elastic solution of three dimensional structures by the finite element method [LWBR development program]
[WAPD-TM-1187] N80-11816
STRUCTURAL DESIGN
Design of the Spar-Wingskin Joint
[AD-A072426] N80-11072
The Building Loads Analysis System Thermodynamics [BLAST] program version 2.0 Input booklet — for predicting energy consumption based on structural size and meteorological data
[AD-A072435] N80-11259
Analysis of pavement systems
[PB-298098/5] N80-11268
Geometrics, hydraulics, and hydrology
[PB-298102/5] N80-11269
STRUCTURAL DESIGN CRITERIA
Methane recovery from sanitary landfills, gas recovery system installation and testing
[PB-296622/4] N80-11254
Executive summary: Mod-1 wind turbine generator analysis and design report
[NASA-CR-159497] N80-11558
STRUCTURAL ENGINEERING
Design and performance evaluation of supercritical airfoils for axial flow compressors
[AD-A071206] N80-11093
Failure criteria for reinforced concrete structures. Volume 1: Literature survey and proposed analytical models
[AD-A070643] N80-11510
Failure criteria for reinforced concrete structures. Volume 2: Analytical model and response data
[AD-A070644] N80-11511
Near-term electric vehicle program: Phase 2. Mid-term summary report
[SAN-1213-02] N80-11956
Report on Finnish technological activities
N80-11991
STRUCTURAL MEMBERS
Preliminary materials assessment in solar demonstration systems
[ANL/EES-CP-30] N80-11619
STRUCTURAL STRAIN
Influence of contour deformation in prebuckling state on bending stability of open cylindrical shells
N80-11025
STRUCTURAL VIBRATION
Statistical energy analysis response prediction methods for structural systems
[NASA-CR-161334] N80-11508
Higher order tapered beam finite elements for vibration analysis
[ISVR-TR-99] N80-11525
SUBMARINE CABLES
Electrical properties of solid insulators as a function of temperature and pressure — submarine telephone cables
[PUBL-364] N80-11364
SUBROUTINE LIBRARIES [COMPUTERS]
SENS: A package of FORTRAN subroutines for functional sensitivity analysis of systems of ordinary differential equations
[CSIR-SWISK-8] N80-11801
RAVAGE: A subroutine library for computer generation of random numbers, random variables, random vectors and stochastic processes
[SMD-MITT-39] N80-11820
SUBROUTINES
SENS: A package of FORTRAN subroutines for functional sensitivity analysis of systems of ordinary differential equations
[CSIR-SWISK-8] N80-11801
GRAFIT: A generalized graphics package
[AD-A072339] N80-11813
FORTRAN subroutines for M estimators in the linear model
[AD-A071744] N80-11815
SUBSONIC AIRCRAFT
A survey of the literature on surface roughness effects on the drag of subsonic aircraft
[FFA-AU-1224] N80-11049
SUBSONIC FLOW
Comparison of boundary layer calculation for a wing: The May 1978 Stockolm workshop test case — computerized simulation
[FFA-AE-1522] N80-11046
SUBSTRATES
Coating laminated substrates
[BDX-613-2062-REV] N80-11153
SUBURBAN AREAS
Institutional constraints on land management for water resource protection in urban and suburban watersheds
[PB-298271/8] N80-11549
SULFIDES
Structural study of high temperature metal-rich titanium sulfide phases
[IS-T-832] N80-11216
SULFONATES
Tertiary oil recovery processes research at the University of Texas
[BETC-0001-1] N80-11544
SULFUR OXIDES
Surface reactions of oxides of sulfur
[PB-297410/3] N80-11183
Air quality maintenance analysis for New Jersey-New York and mid-Hudson AQMA
[PB-297988/8] N80-11655
SULFURIC ACID
The influence on the fatigue properties of aluminum AZ 74 from process variants in sulphuric acid anodizing
[FFA-TN-HU-1943] N80-11220
SUN
Informal conference on Status and Future of Solar Neutrino Research: proceedings
[BNL-50879-VOL-2] N80-11890
SUNLIGHT
Solar access law. Protecting access to sunlight for solar energy systems
[PB-296532/5] N80-11633
SUPERCONDUCTING POWER TRANSMISSION
Some dc superconducting cables — for underground power transmission
[LA-UR-79-1057] N80-11348
SUPERCONDUCTIVITY
Magnetic anomaly in superconducting TmRu4B4
[LA-UR-78-2701] N80-11347
SUPERCONDUCTORS
Experimental feasibility study of the application of magnetic suspension techniques to large-scale aerodynamic test facilities — cryogenic tracnics wind tunnel
[NASA-CR-146761] N80-11102
Design of a tunable high-Q superconducting notch filter
[ANL-78-91] N80-11358
SUPERCRITICAL WINGS
Design and performance evaluation of supercritical airfoils for axial flow compressors
[AD-A071206] N80-11093
SUPERHIGH FREQUENCIES
Concepts for 18/30 GHz satellite communication system, volume 1
[NASA-CR-159625-VOL-1] N80-11277
Concepts for 18/30 GHz satellite communication system, volume 1A: Appendix
[NASA-CR-159625-VOL-1A] N80-11278
Concepts for 18/30 GHz satellite communication system study. Executive summary
[NASA-CR-159680] N80-11279
Solid-state X-band combiner study
[NASA-CR-162432] N80-11328
SUPERNOVA REMNANTS
An emission-line survey of the Milky Way
[NASA-SP-434] N80-11966
SUPERSONIC AIRCRAFT
Supersonic Cruise Research [SCR] program publications for fiscal year 1977 through fiscal year 1979: Preliminary bibliography — bibliographies
[NASA-TM-80184] N80-11029
SUPERSONIC FLOW
Supersonic flow measurements in the body vortex wake of an Ogive nose cylinder
[AD-A071337] N80-11039
Separated flow problems within the transonic and supersonic flow regimes
[AD-A071899] N80-11042
An experimental survey of a separated region on a conical afterbody in a supersonic free stream
[FFA-TN-AU-1187] N80-11047
Flow behind curved shock waves
[UTIAS-217] N80-11374
SUPERSONIC SPEEDS
Overall aerodynamic characteristics of caret and delta wings at supersonic speeds
N80-11022
SURFACE CRACKS
Corrosion fatigue of a marine aluminum alloy [5456-H343] in the presence of shallow cracks
[AD-A072562] N80-11195
SURFACE DEFECTS
Nonlinear dynamic buckling of spherical caps with initial imperfections
[AD-A071450] N80-11514
SURFACE ENERGY
Formulation of electromagnetic pulse external interaction above a lossy earth
[AD-A071327] N80-11298
SURFACE FINISHING
On the damping effect in surface plastic deformation — metal working techniques
N80-11021
Electrochemical deburring. Another sharp sword in the battle with burrs
[BDX-613-2132] N80-11262
Geometrics, hydraulics, and hydrology
[PB-298102/5] N80-11269
SURFACE LAYERS
Ellipsometry of surface layers on lead and lithium
[LBL-8375] N80-11926
SURFACE PROPERTIES
Spectrally selective surfaces with coatings comprised of ultrafine metal particles — solar collectors
[AED-CONF-78-212-004] N80-11620
Study of the electronic surface states of 3-V compounds — study of surface properties of gallium arsenides to understand metal oxide semiconductors
[AD-A073014] N80-11925
SURFACE REACTIONS
Surface reactions of oxides of sulfur
[PB-297410/3] N80-11183
Gas flow through porous barriers
[LBL-8283] N80-11388
Field test of the stabilization of supersized water droplets condensed on pyrotechnically generated hygroscopic nuclei
[AD-A073035] N80-11724
SURFACE ROUGHNESS EFFECTS
A survey of the literature on surface roughness effects on the drag of subsonic aircraft
[FFA-AU-1224] N80-11049
SURFACE WATER
The calculation of evapotranspiration using the Penman formula
[KNMI-WR-79-3] N80-11736
SURFACE WAVES
Propagation of Lg waves across eastern Europe and Asia
[UCRL-52494] N80-11312
SURVEILLANCE RADAR
Surveillance and communication systems using mobile media on the airport surface
[FUB-13-1978] N80-11110
SURVEYS
A survey of electric and hybrid vehicle simulation programs
[NASA-CR-162457] N80-11954
SURVIVAL
Life raft study, February 1978
[AD-A073055] N80-11056
SUSPENDING [HANGING]
Generation rate of turbulent patches in the laminar boundary layer of a submersible
[AD-A071796] N80-11380
SWEDEN
Swedish space activities during 1978
N80-11117
Space research in Sweden, 1978
N80-11993
SWEPTBACK WINGS
Measurements on a three-dimensional swept wing at low speeds. Part 1: The flow around the leading edge
[FFA-130-PT-1] N80-11044
Measurements on a three-dimensional swept wing at low speeds. Part 2: The flow in the boundary layer on the main wing
[FFA-131-PT-2] N80-11045
SWITCHING
Control procedures in packet switched computer networks: Part 2
[FUB-15-1978-PT-2] N80-11825
SWITCHING CIRCUITS
Nanosecond pulsers for MM wave tubes
[AD-A071414] N80-11333
SWITCHING THEORY
Analysis and synthesis problems in dimensioning packet-switched networks
[FUB-32-1978] N80-11826
SWITZERLAND
Space research in Switzerland, 1978
N80-11995
SYNCHRONIZERS
Digital sound: Sampling-rate synchronisation by variable delay
[BBC-RD-1979/17] N80-11271
SYNCHRONOUS SATELLITES
Technology assessment for future MILSATCOM systems. The EHF bands
[AD-A071886] N80-11290
SYNOPTIC METEOROLOGY
The application of measures of synoptic similarity to the evaluation and development of atmospheric prediction models: Task 1
[AD-A073098] N80-11725
Objective use of satellite data due to forecast change: in intensity of tropical disturbances
[PB-298915/0] N80-11744
SYNTHETIC FUELS
Research and development of rapid hydrogenation for coal conversion to synthetic motor fuels [riser cracking of coal]
[FE-2307-38] N80-11249
Methane recovery from sanitary landfills, gas recovery system installation and testing
[PB-296622/4] N80-11254
Department of Energy fossil energy equipment development programs
[CONF-790405-14] N80-11590
SYSTEMS ANALYSIS
Analytic design of complex systems, 1
N80-11014

Analytic design of regulators for variable-parameter systems
N80-11020
LIMS: Laser Inertial Measurement System
[AD-A072899] N80-11040
Systems analysis of arctic fuels dispensing equipment
[AD-A071815] N80-11106
Janus neodymium glass laser operation manual
[UCID-17952] N80-11453
Evaluation of turbomachinery for compressed air energy storage plants
[CONF-781046-6] N80-11625
The smeared concentration approximation method: A simplified air pollution dispersion methodology for regional analysis
[ITASA-RR-78-9] N80-11635
Seismic safety margins research program. Phase I, project 7: Systems analysis specifications of computational approach
[UCRL-13986-1] N80-11699
SENS: A package of FORTRAN subroutines for functional sensitivity analysis of systems of ordinary differential equations
[CSIR-SWISK-8] N80-11801
Scheduling parallel processes without a common scheduler — a systems analysis of computer programming and computer systems design for scheduling parallel processes
[AD-A072158] N80-11814
Near-term electric vehicle program. Phase 2: Mid-term summary report
[SAND-1213-02] N80-11956
SYSTEMS ENGINEERING
On the development of The RB 199
[DRIC-TRANS-5429] N80-11086
Design of a Multichannel FM/FM telemetry system for high G environment applications
[SAND-78-1042] N80-11133
Methane recovery from sanitary landfills; gas recovery system installation and testing
[PB-296622/4] N80-11254
Appendix C. Transmitting and receiving optics considerations
N80-11427
Executive summary: Mod-1 wind turbine generator analysis and design report
[NASA-CR-159497] N80-11558
Heat pump centered integrated community energy systems: Systems development, Dubin-Bloome Associates
[ANL/ICES-TM-29] N80-11572
Magnetic propulsion railguns: Their design and capabilities
[UCRL-82677] N80-11846

T

TABLES [DATA]
Revised table of earth satellites, volume 2: 1969 to 1973
[RAE-TR-79001] N80-11131
A creep data library for DTD 5070A aluminum alloys
[RAE-TR-76067] N80-11219
Space dosimetry. Volume 2: Technical appendices
[FRI-R646/3-VOL-2] N80-11413
TAKEOFF
A method for evaluating aircraft take-off performance
[REPT-1603] N80-11070
TANTALUM
Effect of periodic chemical variation on the mechanical properties of Ta foils
[LA-UR-78-1065] N80-11206
TARGET ACQUISITION
Documentation and user's manual for the Visual Detection Simulator [VDS]
[AD-A070487] N80-11107
A model for estimating radiowave acquisition receiving system intercept probability
[AD-A072503] N80-11304
TARGET RECOGNITION
Space-time signal processing of radar returns
[AD-A072751] N80-11310
Optical power spectrum analysis of processed imagery
[AD-A073083] N80-11335
Real-time video tracking concepts
[AD-A071792] N80-11893
TAYLOR SERIES
Relaxation of Z discharge between electrodes — using Taylor series to find final relaxation of zero pinch magnetohydrodynamic stability
[IPP2-614] N80-11905
TECHNOLOGICAL FORECASTING
Multirole cargo aircraft options and configurations — economic analysis
[NASA-TM-80177] N80-11053
Reliability prediction for mechanical systems
[AD-A071835] N80-11493
TECHNOLOGY ASSESSMENT
Preliminary investigations of design philosophies and features applicable to large magnetic suspension and balance systems
[NASA-CR-162433] N80-11104
Instrumentation developed by the Johns Hopkins University Applied Physics Laboratory for non-APL spacecraft — technology assessment of research and development of spacecraft instruments
[AD-A072438] N80-11135
Assessment of long term research needs for coal-gasification technologies
[PB-297853/4] N80-11255
Nuclear pumped electronic transition laser studies
[LA-UR-78-3015] N80-11447
Earth resources data and information service
[GPO-49-538] N80-11530
Bell Creek residual oil saturation technology test
[BETC-2180-4] N80-11546
An evaluation of the NASA Tech House, including live-in test results, volume 1
[NASA-TP-1564] N80-11559
Cost-effective technology advancement directions for electric propulsion transportation systems in earth-orbital missions
[NASA-TM-79289] N80-11950
Small transport aircraft technology. A report for the committee on commerce, science, and transportation, United States Senate
[NASA-TM-80815] N80-11953
Southeastern forum on appropriate technology
[PB-298796/4] N80-11965
TECHNOLOGY TRANSFER
SEASAT demonstration experiments with the offshore oil, gas and mining industries
[NASA-CR-162423] N80-11532
Transfer of energy conservation technology to industry. A preliminary survey of existing mechanisms
[ANL/EES-TM-28] N80-11576
Proceedings: Solar Thermal Power User Review Panel Meeting
[SERI/TP-69-221] N80-11598
TECHNOLOGY UTILIZATION
An economic analysis of five selected LANDSAT assisted information systems in Oregon
[NASA-CR-162434] N80-11533
TELECOMMUNICATION
A loop for tracking the frequency of a pulsed sinusoid
[AD-A072750] N80-11340
Telecommunications in medicine. A bibliography with abstracts
[NTIS/PS-79/0796/8] N80-11769
TELEMETRY
Design of a Multichannel FM/FM telemetry system for high G environment applications
[SAND-78-1042] N80-11133
TELEVISION RECEIVERS
Parabolic antenna for home receivers of the Broadcasting Satellite System
[BMFT-FB-W-78-11] N80-11314
TELEVISION SYSTEMS
Real-time video tracking concepts
[AD-A071792] N80-11893
TELEVISION TRANSMISSION
Raster-scan display photometric noise measurement
[AD-A073036] N80-11308
TELLURIUM
Investigation of the structure of Te-Se solid solutions obtained in different gravity conditions onboard the Salyut-4 station and in the centrifuge
[D-266] N80-11934
TEMPERATURE COMPENSATION
A method for temperature stabilization of current generators and zenerdiodes
[UPTEC-79-76-R] N80-11366
TEMPERATURE DISTRIBUTION
Effect of vertical scale distortion on the temperature field of a thermal-hydraulic model
[PB-297274/2] N80-11551
Limitations to the use of two-dimensional thermal modeling of a nuclear waste repository
[UCID-18101] N80-11888
TEMPERATURE EFFECTS
Hygrothermal effects on the mechanical response of Kelvar 49/epoxy laminates
[SAND-78-1362C] N80-11154
Electrical properties of solid insulators as a function of temperature and pressure — submarine telephone cables
[PUBL-366] N80-11364
Use of internal sensitivity factors in the analysis of nickel and iron based alloys: Study of the decalibration of sheathed Chromel/Alumel thermocouples
[CONF-781076-1] N80-11406
The 5-thio-d-glucose thermoregulatory effects in mice at various temperatures
[AD-A069511] N80-11757
Experimental enthalpies for a mixture of 80 mole percent isobutane in isopentane
[EPRI-ER-1034] N80-11935
Thermodynamics of high temperature brines
[LBL-8973] N80-11936
TEMPERATURE GRADIENTS
Transient hydrothermal stresses in composites: Coupling of moisture and heat with temperature varying diffusivity — graphite-epoxy composite materials
[AD-A072613] N80-11149
Determination of physical and chemical states of lubricants in concentrated contacts, part 1
[NASA-CR-3206] N80-11225
TEMPERATURE PROFILES
Pitot pressure and total temperature profile measurements in a hypersonic, turbulent boundary layer at M = 9
[IC-AERO-79-01] N80-11048
Measurements of electron density and temperature profiles in a gas blanket experiment
[TRITA-PFU-79-03] N80-11915
TENSILE CREEP
A creep data library for DTD 5070A aluminum alloys
[RAE-TR-76067] N80-11219
TENSILE PROPERTIES
Mechanical properties and oxidation and corrosion resistance of reduced-chromium 304 stainless steel alloys
[NASA-TP-1557] N80-11188
Tensile and creep properties of type 316 stainless steel
[CONF-781219-3] N80-11212
TENSILE STRENGTH
Tensile and flexural strength of non-graphitic superhybrid composites: Predictions and comparisons
[NASA-TM-79276] N80-11144
Impact induced tensile failures in steel
[AD-A072477] N80-11191
TENSILE TESTS
Acoustic emission from hydrogen saturated type 304L stainless steel
[DP-MS-78-50] N80-11208
Mechanical properties of modified 9 Cr-1 Mo steel — charpy impact, tensile, and creep tests performed on steel
[CONF-781219-2] N80-11213
Fatigue testing of precipitating steel 1745 [Custom 455] with machining as the final process
[FFA-TN-HU-1965] N80-11221
TERMINAL BALLISTICS
Approximate methods for the analysis of earth penetration
[SAND-78-1748C] N80-11697
TERNARY SYSTEMS
Low temperature heat capacity studies on hydrogen absorbing intermetallic compounds
[IS-M-210] N80-11203
TERRESTRIAL RADIATION
Feasibility study for the Spacelab User Program. Measurement of terrestrial noise, radio control
[BMFT-FB-W-78-14] N80-11115
Comparison of extraterrestrial and earth-based solar spectral irradiance results
[CSIR-RR-342] N80-11980
Space research in Belgium, 1978
N80-11997
TEST CHAMBERS
Smog chamber validation using Lagrangian atmospheric data
[PB-297480/6] N80-11662
TEST FACILITIES
The RSRE satellite communications test facility
[RSRE-78008] N80-11119
Midtemperature Solar Systems Test Facility [MSSTF] project test results: Phase 4A MSSTF system operation
[SAND-78-1088] N80-11613
TESTS
Test procedure for C-band noncoherent radar transponder
[AD-A072069] N80-11286
TEXAS
Environmental studies of the south Texas outer continental shelf, 1977. Ichthyoplankton/Mackerel Eggs and larvae
[PB-296647/1] N80-11753
Environmental studies of the South Texas continental shelf, 1976 - 1977. Historical zooplankton
[PB-296646/3] N80-11754
Environmental studies of the south Texas continental shelf. Seapper/Grouper
[PB-296645/5] N80-11755
TEXTURES
Activities report of the Image Laboratory
[ENST-D-79005] N80-11901
THALLIUM COMPOUNDS
Chemical vapor deposition of TiB2 on graphite
[SAND-78-1794C] N80-11173
THEORETICAL PHYSICS
Collective states and crossing symmetry
[CSIR-TWISK-58] N80-11840
Theoretical and high energy physics
[COO-1764-342] N80-11912
THERMAL ABSORPTION
An experimental apparatus for measuring the thermal absorption of GaSe sub 1-x sub x components
[ISS-T-78/17] N80-11930
THERMAL DIFFUSIVITY
Transient hydrothermal stresses in composites: Coupling of moisture and heat with temperature varying diffusivity — graphite-epoxy composite materials
[AD-A072613] N80-11149
THERMAL EXPANSION
Thermal expansion of glasses at low temperatures — fused silica and polymethyl methacrylate
[IS-T-829] N80-11234
THERMAL PROTECTION
Design and fabrication of elevon cove thermal protection systems for aerospace vehicles
[NASA-CR-159055] N80-11134

Corrosion resistant thermal barrier coating --- protecting gas turbines and other heat engine parts
[NASA-CASE-LEW-13088-1] N80-11142
THERMAL STABILITY
Experimental study of shell stability under heating and loading
N80-11003
Toxicity and thermal properties of polyphosphazenes
[AD-A072120] N80-11228
Behavior of lightly confined high explosives in a jet-fuel fire
[UCRL-52659] N80-11247
Use of indexed sensitivity factors in the analysis of nickel and iron based alloys: Study of the decalibration of sheathed Chromel/Alumel thermocouples
[CONF-781076-1] N80-11406
The C-13 study of the potential influence of thermal aging on the molecular integrity of FEFO
[MHSMP-78-32] N80-11881
THERMAL STRESSES
Transient hydrothermal stresses in composites: Coupling of moisture and heat with temperature varying diffusivity --- graphite-epoxy composite materials
[AD-A072613] N80-11149
Limitations to the use of two-dimensional thermal modeling of a nuclear waste repository
[UCID-18101] N80-11888
THERMOCHEMICAL PROPERTIES
Experimental enthalpies for a mixture of 80 mole percent isobutane in isopentane
[EPRI-ER-1034] N80-11935
THERMOCLINES
Numerical case studies for oceanic thermal anomalies with a dynamic model
[AD-A072587] N80-11748
THERMOCOUPLES
Use of indexed sensitivity factors in the analysis of nickel and iron based alloys: Study of the decalibration of sheathed Chromel/Alumel thermocouples
[CONF-781076-1] N80-11406
THERMODYNAMIC COUPLING
COUPLEFLO: A computer code for coupled creeping viscous flow and conductive-convective heat transfer. Part 1: Theoretical background
[SAND-78-1046-PT-1] N80-11390
THERMODYNAMIC EFFICIENCY
Heat loss reduction techniques for annular solar receiver designs
[SAND-78-1769] N80-11581
Design considerations for a proposed passive vacuum solar annular receiver
[SAND-78-0982] N80-11582
Thermodynamic assessment of OTEC open-cycle power systems
[CONF-790459-2] N80-11938
THERMODYNAMIC PROPERTIES
Micromechanics of intraply hybrid composites: Elastic and thermal properties
[NASA-TM-79253] N80-11143
Investigations of intermetallic alloy hydriding mechanism
[ORO-5246-3] N80-11202
Construction of the equation of state for chemical compounds
[UCRL-TRANS-11474] N80-11937
THERMODYNAMICS
Environmental effects of heat and moisture release from atmospheric spray cooling systems
[CONF-780520-7] N80-11642
Thermodynamics of high temperature brines
[LBL-8973] N80-11936
THERMOELECTRIC GENERATORS
General-purpose heat source project space nuclear safety program and radioisotopic terrestrial safety program --- plutonium oxide
[LA-7519-PR] N80-11889
THERMOGRAVIMETRY
A thermogravimetric system for investigating gas-metal reactions at elevated temperatures
[MRL-R-726] N80-11187
THERMOLUMINESCENCE
A combined TLD/emulsion method of sampling dosimetry applied to Apollo missions
[NASA-CR-160367] N80-11985
THERMOPLASTIC RESINS
Induction heating gun
[NASA-CASE-LAR-12540-1] N80-11468
One step dual purpose joining technique
[NASA-CASE-LAR-12595-1] N80-11469
THERMOREGULATION
The 5-thio-d-glucose thermoregulatory effects in mice at various temperatures
[AD-A069511] N80-11757
THERMOSETTING RESINS
A generalized time-temperature-transformation phase diagram for thermosetting systems
[AD-A073007] N80-11163
THERMOSPHERE
Scientific objective 6: Thermospheric chemistry and transport
N80-11421
THICKNESS RATIO
Mixed inverse problem for profile with given velocity distribution on one side and known thickness law
N80-11026
THIN FILMS
Shelf life determination of epoxy prepregs and film adhesives
[BDX-613-2033-REV] N80-11233
Automated monitoring of thin film capacitors for electrical breakdown
[BDX-613-2076-REV] N80-11359
THIN PLATES
Determination of loads and stress in composite material layers for a plate in the plane stress state
N80-11023
Classical analyses of laminated bimodulus composite-material plates
[AD-A072276] N80-11147
THIN WALLED SHELLS
Numerical integration of equations of theory of thin-wall beams with deformable contour
N80-11018
THREE DIMENSIONAL BOUNDARY LAYER
Comparison of boundary layer calculation for a wing: The May 1978 Stocholm workshop test case --- computerized simulation
[FFA-AE-1522] N80-11046
THREE DIMENSIONAL FLOW
A computational model for three-dimensional incompressible wall jets with large cross flow
[AD-A071689] N80-11495
THRESHOLDS
Interstimulus interval as it affects temporary threshold shift in serial presentations of loud tones
[AD-A072006] N80-11762
THULIUM COMPOUNDS
Magnetic anomaly in superconducting TmRa4B4
[LA-UR-78-2701] N80-11347
THUNDERSTORMS
The usefulness of data from mountaintop fire lookout stations in determining atmospheric stability --- determining atmospheric turbulence indexes to forecast thunderstorms
[PB-298899/6] N80-11743
THYRISTORS
Unconventional circuits for static voltage transformers
[BMFT-FB-T-78-26] N80-11368
TIMBER INVENTORY
Land cover classification from Landsat data: Phase 3 of a joint DOE/NASA demonstration
[AD-A071723] N80-11535
TIME DIVISION MULTIPLEXING
A loop for tracking the frequency of a pulsed sinusoid
[AD-A072750] N80-11340
TIME OF FLIGHT SPECTROMETERS
A spectrometer for detecting charged particles of medium energies: Experiment KED-ISEE
[BMFT-FB-W-78-19] N80-11410
TIME OPTIMAL CONTROL
Control strategies for complex systems for use in aerospace avionics
[AD-A072540] N80-11081
On the achievable accuracy in stochastic control
[UPTEC-78-23-R] N80-11834
TIME SERIES ANALYSIS
What will your time series analysis computer package do? Computer packages
[CONF-7805149-2] N80-11795
Inference under order and smoothness restrictions with applications in time series analysis
[AD-A072594] N80-11858
TIRES
Ranking tires using a transient speed-time cycle
[PB-297756/9] N80-11487
Computer simulation of tire slip on a clayton twin roll dynamometer
[PB-297764/3] N80-11488
TITANIUM
Titanium combustion research program and user's manual for deck CCD 1152-0.0
[AD-A072529] N80-11161
TITANIUM ALLOYS
Titanium combustion research program and user's manual for deck CCD 1152-0.0
[AD-A072529] N80-11161
Evaluation of yttriated titanium 6 Al-4 V plates and forgings
[AD-A072439] N80-11196
Fatigue testing of forged titanium
[FFA-HU-1997] N80-11224
TITANIUM COMPOUNDS
Structural study of high temperature metal-rich titanium sulfide phases
[IS-T-832] N80-11216
TOKAMAK DEVICES
Energy storage for Tokamak reactor cycles
[PPPL-1511] N80-11569
Ballooning beta limit of a non-circular small-aspect-ratio Tokamak
[IPPJ-413] N80-11902
Long pulse technology Tokamak
[CONF-780966] N80-11911
Progress in RINGBOOK 2, TORTUR 2 and SPICA 2 for 1978
N80-11920
TOPOLOGY
Observability with conic observation set
[CSIR-TWISK-59] N80-11838
TOROIDAL PLASMAS
Direct comparison between circularly and linearly polarized RF field in ICRF heating of a toroidal plasma
[IPPJ-416] N80-11905
Continuous double adiabatic spectrum in a plasma confined in a poloidal magnetic field
[TRITA-PFU-79-02] N80-11914
Resonance and cut-off surfaces in the ion cyclotron frequency range in toroidal geometry
[TRITA-PFU-79-04] N80-11916
TOROIDAL SHELLS
On the limit state of a toroidal shell of revolution under axisymmetric deformation
N80-11015
TOUCHDOWN
Application of modified profile analysis to function testing of simulated CTOL transport touchdown-performance data
[NASA-TP-1541] N80-11069
TOXICITY
Toxicity and thermal properties of polyphosphazenes
[AD-A072120] N80-11228
TOXICOLOGY
National environmental/energy workforce assessment, phase 3. Pesticides and toxicology programs --- post-secondary educational directory
[PB-298582/8] N80-11664
TRACE CONTAMINANTS
Effect of surface contamination of solid phase welding: An overview
[SAND-78-0223C] N80-11478
TRACE ELEMENTS
Trace elements from coal combustion: Atmospheric emissions
[ICTIS/TR-05] N80-11180
Trace metals and marine production processes --- conference proceedings
[PB-298333/6] N80-11654
TRACKING [POSITION]
Avionics master plan data base mechanization architecture
[AD-A071545] N80-11083
A loop for tracking the frequency of a pulsed sinusoid
[AD-A072750] N80-11340
Head aiming/tracking accuracy in a helicopter environment
[AD-A071359] N80-11788
TRAFFIC
Hybrid optimization in urban traffic networks
[PB-297146/3] N80-11960
TRAFFIC CONTROL
Hybrid optimization in urban traffic networks
[PB-297146/3] N80-11960
TRAILING-EDGE FLAPS
On a smooth approximation method and its application to mathematical description of wing aerodynamic characteristics
N80-11011
Influence of wing deformation on trailing-edge flap deflections
N80-11012
TRAJECTORY ANALYSIS
Physical and chemical properties of aerosols under varying European influence
[AC-48] N80-11705
TRANSDUCERS
The equivalent circuit in the mobility analogy of a magnetostrictive transducer in the presence of eddy currents
[AD-A072879] N80-11336
TRANSFORMATIONS [MATHEMATICS]
Testing transformations to achieve approximate normality
[AD-A072596] N80-11846
Differential difference evolution equations. Part 2: Darboux transformation for the Toda lattice
[PM/79/11] N80-11932
TRANSFORMERS
Production Engineering Measure [PEM] manufacturing methods and technology for piezoelectric transformers
[AD-A072674] N80-11343
Development of a 3 MV pulse transformer
[SAND-79-0813] N80-11344
TRANSISTORS
Reliability of packaged beam-lead transistors built with different pre-seal assembly techniques
[BDX-613-1952-REV] N80-11349
TRANSITION METALS
Catalysis by transition metal compounds --- cobalt oxide
[COO-1198-1234] N80-11217
TRANSITION TEMPERATURE
A generalized time-temperature-transformation phase diagram for thermosetting systems
[AD-A073007] N80-11163
TRANSLATIONAL MOTION
Lateral and tilt whirl modes of flexibly mounted flywheel systems --- for energy storage
[SAND-78-7070] N80-11622
TRANSMISSION LINES
Development of a 3 MV pulse transformer
[SAND-79-0813] N80-11344
Preliminary dielectric studies. Spir-o-line cable for application at power frequencies
[HCP/T5054-01] N80-11351

Injection laser diodes for fiber optic communications
[AD-A072504] N80-11431
Control procedures in packet switched computer networks: Part 2
[FUB-15-1978-PT-2] N80-11825
TRANSMITTER RECEIVERS
Appendix C: Transmitting and receiving optics considerations
N80-11427
TRANSONIC COMPRESSORS
Experimental study of low aspect ratio compressor blading
[NASA-TM-79280] N80-11037
TRANSONIC FLOW
Separated flow problems within the transonic and supersonic flow regimes
[AD-A071899] N80-11042
Kinetic heating of high speed missiles
[PREPRINT-1975-5] N80-11128
TRANSONIC SPEED
Evaluation of an ejector powered engine simulator at transonic Mach numbers
[AD-A071607] N80-11094
TRANSONIC WIND TUNNELS
Experimental feasibility study of the application of magnetic suspension techniques to large-scale aerodynamic test facilities — cryogenic tranonics wind tunnel
[NASA-CR-146761] N80-11102
TRANSPIRATION
Optimum shape for transpiration-cooled nosetip of a reentry vehicle
[AD-A072296] N80-11118
TRANSPONDERS
Evaluation of transponder antenna coverage/ATCRBS during simulated flights of aircraft
[AD-A073547] N80-11275
Test procedure for C-band noncoherent radar transponder
[AD-A072069] N80-11286
TRANSPORT AIRCRAFT
Evaluation of dais technology applied to the integrated navigation system of a tactical transport
[AD-A073068] N80-11061
TRANSPORT PROPERTIES
Transport properties for ablation products: An illustration using the He-C2h interaction — jovian atmosphere
N80-11373
Scientific objective 2: Stratospheric and mesospheric chemistry and transport
N80-11417
Scientific objective 6: Thermospheric chemistry and transport
N80-11421
Space charge limited transport and bunching of non K-V beams
[AD-A072417] N80-11877
TRANSPORTATION
Disaggregating PIES fuel forecasts, validating PIES transportation model data base, and other technical services
[TID-29000] N80-11612
Development of an emergency response program for transportation of hazardous waste
[PB-297438/4] N80-11962
TRAPPED PARTICLES
Phase space coordinates of long lifetime trapped radiation from Stoermer Mapping
[AD-A072995] N80-11694
TRAVEL
Directions to improve urban travel demand forecasting: Conference summary and white papers
[PB-297409/5] N80-11959
TRAVELING WAVE AMPLIFIERS
Analysis and Design of a phase linearization system for traveling wave tube amplifiers
[CNES-NT-86] N80-11362
TRAVELING WAVE TUBES
Feasibility demonstration of a high power wideband TWT with low AM/PM distortion
[AD-A072932] N80-11342
TRENDS
Will an increasing number of companies start making their own LSI-components? An evaluation of development trends in the electronics industry
[ECR-82] N80-11360
Trend-free block designs: Existence and construction results
[AD-A072138] N80-11863
TROPICAL REGIONS
Materiel testing in the tropics
[AD-A072434] N80-11489
The dynamics of equatorial mass-flow adjustment
[PB-297992/0] N80-11740
TROPICAL STORMS
Objective use of satellite data due to forecast changes in intensity of tropical disturbances
[PB-298915/0] N80-11744
TROPOSPHERE
Analysis of tropospheric effects at low elevation angles
[AD-A073089] N80-11691
Convection induced temperature change in GATE
[PB-298130/6] N80-11712
TURBINE ENGINES
The use of the Maurer factor for estimating the cost of a turbine engine in the early stages of development
[AD-A073018] N80-11095
TURBINES
Off-design performance prediction of radial inflow turbines, volume 2
N80-11479
Executive summary: Mod-1 wind turbine generator analysis and design report
[NASA-CR-159497] N80-11558
TURBOCOMPRESSORS
Experimental study of low aspect ratio compressor blading
[NASA-TM-79280] N80-11037
Design and performance evaluation of supercritical airfoils for axial flow compressors
[AD-A071206] N80-11093
On the off-design performance of small radial turbines
N80-11485
TURBOJET ENGINES
Evaluation of an ejector powered engine simulator at transonic Mach numbers
[AD-A071607] N80-11094
TURBOMACHINERY
Fracture and fatigue properties of 1Cr-Mo-V bainitic turbine rotor steels
[EPRI-NP-1023] N80-11201
Evaluation of turbomachinery for compressed air energy storage plants
[CONF-781046-6] N80-11625
TURBOPROP AIRCRAFT
Feasibility tests of use of the tri turbo-3 aircraft for arctic AXBT drops
[AD-A073159] N80-11074
TURBULENCE
Local turbulence properties in flames from time-averaged Raman spectroscopy measurements
[SAND-78-1263C] N80-11171
Generation rate of turbulent patches in the laminar boundary layer of a submersible
[AD-A071796] N80-11380
TURBULENCE EFFECTS
The effect of pressure gradient and external turbulence on heat transfer to a cold flat plate
[VKI-TN-128] N80-11396
TURBULENT BOUNDARY LAYER
Pitot pressure and total temperature profile measurements in a hypersonic, turbulent boundary layer at M = 9
[IC-AERO-79-01] N80-11048
The effect of short regions of high surface curvature on turbulent boundary layers — in a low speed wing tunnel
[IC-AERO-78-02] N80-11393
The response of a turbulent boundary layer to lateral divergence
[IC-AERO-78-03] N80-11394
Turbulent boundary layers on surfaces of mild longitudinal curvature — in a low speed wind tunnel
[IC-AERO-78-04] N80-11395
TURBULENT DIFFUSION
Parameterization of vertical diffusion in a diurnally varying boundary layer
[DM-27] N80-11706
The atmosphere boundary layer
[WMO-523] N80-11707
TURBULENT FLOW
Measurements of turbulence parameters in a rocket engine exhaust using a laser crossed beam correlation technique
[AASU-340] N80-11140
Mixing and combustion in high speed air flows
[AD-A072642] N80-11159
Numerical solution of turbulent flow problems in general geometry
[KAPL-4116] N80-11382
The effect of short regions of high surface curvature on turbulent boundary layers — in a low speed wing tunnel
[IC-AERO-78-02] N80-11393
The response of a turbulent boundary layer to lateral divergence
[IC-AERO-78-03] N80-11394
Turbulent boundary layers on surfaces of mild longitudinal curvature — in a low speed wind tunnel
[IC-AERO-78-04] N80-11395
A study of coherent structures in axisymmetric jets using an optical technique
[AASU-341] N80-11399
TURBULENT HEAT TRANSFER
The effect of pressure gradient and external turbulence on heat transfer to a cold flat plate
[VKI-TN-128] N80-11396
TURBULENT JETS
A method for the measurement of mixing properties in a turbulent jet flow
[VKI-TN-130] N80-11398
TWO PHASE FLOW
Application of implicit numerical methods to problems in two-phase flow
[NUREG-CR-0763] N80-11383
Comparisons of RETRAN and two-velocity two-phase flow models with experimental data
[EPRI-NP-928] N80-11392
Current capabilities of transient two-phase flow instruments
[CONF-790505-9] N80-11402

U

UH-1 HELICOPTER
A compilation and analysis of helicopter handling qualities data. Volume 1: Data compilation
[NASA-CR-3144] N80-11097
Rotary wing proficiency-based Aviator Selection System [PASS]
[AD-A069838] N80-11774
ULTRAHIGH FREQUENCIES
Radio-wave propagation investigations on a digital radio link at 2.2 GHz
[FOA-A-30020-E2] N80-11325
ULTRASONIC TESTS
Exploratory development of adhesive band flaw detection
[AD-A072724] N80-11496
ULTRAVIOLET LASERS
Ultraviolet lasers. Citations from the international aerospace abstracts data base
[NTIS/PS-79/0861/9] N80-11462
ULTRAVIOLET SPECTROSCOPY
Numerical deconvolution of photoelectron spectra of liquids
[AD-A073087] N80-11164
UNDERGROUND STORAGE
Underground pumped hydro storage: An overview
[CONF-781046-1] N80-11624
UNDERGROUND TRANSMISSION LINES
Some dc superconducting cables — for underground power transmission
[LA-UR-79-1057] N80-11348
UNDERWATER ACOUSTICS
Acoustic phase fluctuations caused by Garrett-Munk internal waves
[AD-A071354] N80-11872
Fiber optic detection of low frequency underwater sound
[AD-A072829] N80-11898
UNDERWATER RESOURCES
SEASAT demonstration experiments with the offshore oil, gas and mining industries
[NASA-CR-162423] N80-11532
Preliminary assessment of industrial needs for an advanced ocean technology
[NASA-CR-162435] N80-11747
UNDERWATER TESTS
Evaluation of commercially available submersible pressure gauges
[AD-A071481] N80-11401
UNDERWATER VEHICLES
Generation rate of turbulent patches in the laminar boundary layer of a submersible
[AD-A071796] N80-11380
UNITED KINGDOM
Satellite broadcasting: Results of a preliminary coverage survey in the UK
[BBC-RD-1979/18] N80-11270
UNITED STATES OF AMERICA
Geothermal exploration methods and results: Inland states
[LA-UR-79-665] N80-11543
United States/Canada electricity exchanges
[DOE/ERA-0053] N80-11583
Physical regionalization of coastal ecosystems of the United States and its territories
[PB-297143/0] N80-11661
Synthesis of regional ground motion from western US earthquakes
[AD-A069727] N80-11682
Southeastern forum on appropriate technology
[PB-298796/4] N80-11965
UNIVERSITIES
National environmental/energy workforce assessment, phase 3. Pesticides and toxicology programs — post-secondary educational directory
[PB-298582/8] N80-11664
National environmental/energy workforce assessment, phase 3. Composite: Environmental science/health — post-secondary educational directory
[PB-298590/1] N80-11668
National environmental/energy workforce assessment, phase 3. Air programs — bibliography
[PB-298580/2] N80-11670
UNSTEADY FLOW
A comparison of five methods for calculating the exhaust flow from internal combustion engines
N80-11482
UPPER ATMOSPHERE
Scientific objective 5: Upper atmospheric waves
N80-11420
Geophysics, astronomy and space, no. 450
[JPRS-73946] N80-11527
Comparison of spectroscopic and radiometric measurements of upper atmosphere water vapor
[PB-299072/9] N80-11713
Space research in the United Kingdom
N80-11998
URANIUM FLUORIDES
Argon/UF6 plasma exhaust gas reconstitution experiments using preheated fluorine and on-line diagnostics — fissioning uranium plasma core reactor design
[NASA-CR-159158] N80-11906
URBAN DEVELOPMENT
Report on Finnish technological activities
N80-11991

URBAN PLANNING
Study in remote sensing for land use
[AD-A071802] N80-11537
URBAN TRANSPORTATION
Directions to improve urban travel demand forecasting: Conference summary and white papers
[PB-297409/5] N80-11959
Hybrid optimization in urban traffic networks
[PB-297146/3] N80-11960
URETHANES
Characterization of low density rigid urethane foam
[BDX-613-1890-REV] N80-11232
USER MANUALS [COMPUTER PROGRAMS]
Manned engineering flight simulation validation, part 2: Software user's guide
[AD-A071395] N80-11105
The Building Loads Analysis and System Thermodynamics [BLAST] program, version 2.0: Users manual, volume 1
[AD-A072272] N80-11258
A users guide for the Advanced Scientific Computer [ASC]
[AD-A072405] N80-11791
GRAFIT: A generalized graphics package
[AD-A072339] N80-11813
User's manual for the computer program TODEP — two dimensional wave propagation
[FOA-C-20308-D4] N80-11822
Zero base budget software
[PB-298732/9] N80-11942
USER REQUIREMENTS
Proceedings: Solar Thermal Power User Review Panel Meeting
[SERI/TP-69-221] N80-11598
UTILITIES
Regional reference energy systems: Electric utility applications
[BNL-50962] N80-11585
Demand management demonstration project. Stage 1: Development of residential load characteristics. Stage 4: Demonstration of residential incremental cost pricing implemented by time-of-day metering
[HCP/B8072-01] N80-11941

V

V/STOL AIRCRAFT
Height of spray produced by vertical takeoff and landing [VTOL] aircraft
[AD-A073099] N80-11075
Inequalities and approximation with applications to VSTOL aircraft — using control theory for optimal control approximations
[AD-A071807] N80-11099
VACUUM DEPOSITION
Effect of periodic chemical variation on the mechanical properties of Ta foils
[LA-UR-78-3065] N80-11206
VACUUM FURNACES
Zone crystallization under zero gravity
[BMFT-FB-W-77-12] N80-11929
VANADIUM
Partial molar volumes of hydrogen and deuterium in niobium and vanadium
[IS-T-839] N80-11172
Annealing of neutron-irradiated vanadium containing oxygen
[IS-T-816] N80-11215
VANADIUM ALLOYS
Evaluation of yttriated titanium 6 Al-4 V plates and forgings
[AD-A072439] N80-11196
VAPOR DEPOSITION
Chemical vapor deposition of TiB2 on graphite
[SAND-78-1794C] N80-11173
VAPOR PHASES
Resonance Raman spectra of metal halide vapor complexes
[CONF-780941-8] N80-11175
VAPORS
Photo ion mass spectrometry and photoelectron spectroscopy of high temperature vapors
[CONF-780941-4] N80-11174
VARIABILITY
Digital sound: Sampling-rate synchronisation by variable delay
[BBC-RD-1979/17] N80-11271
Comparison of some instrumental variable methods: Consistency and accuracy aspects
[UPTEC-78-88-R] N80-11499
VARIABLE PITCH PROPELLERS
Aircraft control by propeller cyclic blades
[NASA-CR-3212] N80-11031
VECTOR SPACES
Remainder term estimates in one and many-dimensional renewal theory
N80-11861
VECTORS [MATHEMATICS]
RAVAGE: A subroutine library for computer generation of random numbers, random variables, random vectors and stochastic processes
[SMD-MITT-39] N80-11820
VEGETATION
The calculation of evapotranspiration using the Penman formula
[KNMI-WR-79-3] N80-11736
VELOCITY DISTRIBUTION
Mixed inverse problem for profile with given velocity distribution on one side and known thickness law
N80-11026
A method for predicting the noise levels of connular jets with inverted velocity profiles
[NASA-CR-3176] N80-11868
VELOCITY MEASUREMENT
Development of critical fluidic components — study of fluidic angular velocity sensors
[AD-A071650] N80-11379
VERTICAL AIR CURRENTS
Parameterization of vertical diffusion in a diurnally varying boundary layer
[DM-27] N80-11706
VERTICAL TAKEOFF AIRCRAFT
Fuel minimal take-off path of jet lift VTOL aircraft, log no. C3558
N80-11066
Performance, physiological, and oculometer evaluation of VTOL landing displays
[NASA-CR-3171] N80-11771
VESTIBULAR TESTS
Perception and performance in flight simulators: The contribution of vestibular, visual, and auditory information
[NASA-CR-162129] N80-11103
VIBRATION
The effect of interblade phase angle and solidity on the time variant aerodynamic response of a compressor stator
[AD-A071878] N80-11092
VIBRATION DAMPING
On the damping effect in surface plastic deformation — metal working techniques
N80-11021
VIRGINIA
Land cover classification from Landsat data: Phase 3 of a joint DOE/NASA demonstration
[AD-A071723] N80-11535
VISCOUS FLOW
Effects of precursor heating on radiative and chemically reacting viscous flow around a Jovian entry body
[NASA-CR-3186] N80-11375
COUPLEFLO: A computer program for coupled creeping viscous flow and conductive-convective heat transfer. Part 2: user's manual
[SAND-78-1407] N80-11385
COUPLEFLO: A computer code for coupled creeping viscous flow and conductive-convective heat transfer. Part 1: Theoretical background
[SAND-78-1046-PT-1] N80-11390
VISIBILITY
A report on atmospheric obstructions to visibility. Volume 1: Study results
[AD-A071741] N80-11717
VISION
Spatio-temporal intergration in the visual system
[AD-A069558] N80-11780
VISORS
Integrated helmet-mounted sight/display program: Coating technology
[AD-A072060] N80-11782
VISUAL DISCRIMINATION
Helmet-mounted displays: An experimental investigation of display luminance and contrast
[AD-A072059] N80-11783
Helmet-mounted sight/display program: Cessna 310 flight test
[AD-A072058] N80-11786
VISUAL PERCEPTION
Perception and performance in flight simulators: The contribution of vestibular, visual, and auditory information
[NASA-CR-162129] N80-11103
Spatio-temporal intergration in the visual system
[AD-A069558] N80-11780
Helmet-mounted displays: A computer-assisted analysis of day-night visual requirements
[AD-A072061] N80-11784
The role of the upper field of view in selected HMS/D visual tasks
[AD-A072064] N80-11785
VOCODERS
Development of a voice funnel system
[AD-A072424] N80-11295
Development of a voice funnel system
[AD-A072423] N80-11296
Reduction of quantization noise in PCM speech coding
[AD-A072203] N80-11300
VOICE COMMUNICATION
Integrated Autodin System [IAS]: Generation of viable far-term architectures for IAS
[AD-A072165] N80-11288
Development of a voice funnel system
[AD-A072424] N80-11295
A proposal for a nonlinear method of representation of voice signals
[FUB-33-1978] N80-11323
VOICE DATA PROCESSING
Voice data entry in air traffic control
[AD-A073670] N80-11273
Development of a voice funnel system
[AD-A072423] N80-11296
Enhancement and bandwidth compression of noisy speech
[AD-A073139] N80-11305
VOLTAGE CONVERTERS [DC TO DC]
Unconventional circuits for static voltage transformers
[BMFT-FB-T-78-26] N80-11368
VORTICES
Leading edge vortex-flap experiments on a 74 deg delta wing
[NASA-CR-159161] N80-11038
Supersonic flow measurements in the body vortex wake of an Ogive nose cylinder
[AD-A071337] N80-11039
The role of the asymmetric terms of the divergence and vorticity equations in the zero Laplacian vortex
[AD-A072452] N80-11850

W

WAFERS
Silicon solar cell process development, fabrication and analysis, phase 1
[NASA-CR-162427] N80-11561
WAKES
Characteristics of lightly loaded fan rotor blade wakes
[NASA-CR-3188] N80-11034
Supersonic flow measurements in the body vortex wake of an Ogive nose cylinder
[AD-A071337] N80-11039
WALL FLOW
Nonisenthalpic interaction of a planar premixed laminar flame with a parallel end wall
[AD-A071658] N80-11160
WALLS
Mach 130 air shock attenuation studies — outlet pipes
[UCRL-82012] N80-11043
WALSH FUNCTION
Theory and applications of generalized Walsh functions in digital systems
[AD-A072511] N80-11864
WARNING SYSTEMS
F-4 radar altimeter aural warning
[AD-A072870] N80-11085
Microcomputer-based video motion detection system
[Y/DA-7996] N80-11797
WASHINGTON
Study in remote sensing for land use
[AD-A071802] N80-11537
WASTE DISPOSAL
Limitations to the use of two-dimensional thermal modeling of a nuclear waste repository
[UCID-18101] N80-11888
Development of an emergency response program for transportation of hazardous waste
[PB-297438/4] N80-11962
WASTE ENERGY UTILIZATION
High COP heat pump system, phase 1, results
[HCP/M5056-01] N80-11573
Heat pump centered integrated community energy systems: System development
[ANL-ICES-TM-28] N80-11574
WASTE TREATMENT
Advanced methods for the treatment of domestic sewage — at highway rest stops
[CONF-7810108-1] N80-11955
Removal of lagoon effluent suspended solids by a slow-rock filter
[PB-297454/1] N80-11957
Economics of disposal of lime/limestone scrubbing wastes: Sludge/flyash blending and gypsum systems
[PB-297946/6] N80-11961
WASTE UTILIZATION
Water reuse and recycling. Volume 1: Evaluating
[PB-297283/4] N80-11958
WASTE WATER
An evaluation of the NASA Tech House, including live-in test results, volume 1
[NASA-TP-1564] N80-11559
National environmental/energy workforce assessment, phase 3. Water/wastewater programs — directory of courses available
[PB-298588/5] N80-11666
National environmental/energy workforce assessment, phase 3. Wastewater programs — indexes to waste water education programs
[PB-298584/4] N80-11672
Water reuse and recycling. Volume 1: Evaluating
[PB-297283/4] N80-11958
WATER
Underground pumped hydro storage: An overview
[CONF-781046-1] N80-11624
WATER COOLED REACTORS
Response of a double tube sheet structure to hydraulic pressure transients
[DP-MS-78-73] N80-11519
WATER HEATING
Solar energy system installed at the North Georgia APDC office building
[NASA-CR-161273] N80-11555
Solar heating and cooling systems design and development
[NASA-CR-150873] N80-11560
Investigation of the applicability of technical systems utilizing solar energy for the heat supply of buildings
[BMFT-FB-T-78-48] N80-11630

WATER MODERATED REACTORS
Application of implicit numerical methods to problems in two-phase flow
[NUREG-CR-0763] N80-11383
WATER POLLUTION
Determinations of hydrologic parameters for glacial tills in Connecticut
[PB-297578/7] N80-11548
Institutional constraints on land management for water resource protection in urban and suburban watersheds
[PB-298271/8] N80-11549
Reconnaissance survey of the distribution and abundance of benthic organisms in the New York Bight Apex 5-14 June 1973
[PB-297333/7] N80-11552
A field study of the relationship between heavy metal concentrations in stream water and selected benthic macroinvertebrate species
[PB-297284/2] N80-11651
All the water on earth is all the water there is --- ocean pollution
[PB-298340/1] N80-11653
Trace metals and marine production processes --- conference proceedings
[PB-298333/6] N80-11654
Biochemical studies of the Potomac estuary, summer 1978
[PB-297394/9] N80-11752
Sampling and analysis of the aquatic environment in POTW's and their vicinity
[PB-297606/6] N80-11963
A history of land application as a treatment alternative
[PB-298227/0] N80-11964
WATER QUALITY
Energy development vs water quality in the upper Colorado and upper Missouri River Basins
[LA-7497-MS] N80-11641
Sampling and analysis of the aquatic environment in POTW's and their vicinity
[PB-297606/6] N80-11963
WATER RECLAMATION
High flux PBI reverse osmosis membranes for desalination and water reuse
[PB-297285/9] N80-11184
Water reuse and recycling. Volume 1: Evaluating
[PB-297283/4] N80-11958
WATER RESOURCES
Interactive water resources planning using computer graphics
[PB-297994/6] N80-11550
Remote sensing applied to hydrology. A bibliography with abstracts
[NTIS/PS-79/0845/2] N80-11553
All the water on earth is all the water there is --- ocean pollution
[PB-298340/1] N80-11653
WATER TABLES
Effects of pumping on ground-water levels near, Taylorsville, Bartholomew County, Indiana
[PB-298244/5] N80-11710
WATER TEMPERATURE
Improvements in apparatus for pH measurement of water
[TDB-320] N80-11412
OTEC thermal resource report for western coast Mexico --- climate and oceanographic parameters
[HCP/T2898] N80-11600
WATER VAPOR
Measurements of important minor constituents in the middle atmosphere --- microwave radiometer to measure water vapor in the middle atmosphere
[AD-A071845] N80-11679
Method of calculating H2O transmission between 333 and 633 cm-1
[AD-A072850] N80-11683
Comparison of spectroscopic and radiometric measurements of upper atmosphere water vapor
[PB-299072/9] N80-11713
Infrared absorption by water clusters
[AD-A071455] N80-11895
WATER WAVES
Long wave coupling of the mid and south Atlantic bights forced by the atmosphere
[AD-A072282] N80-11749
WATERPROOFING
Evaluation of commercially available submersible pressure gauges
[AD-A071481] N80-11401
WATERSHEDS
Institutional constraints on land management for water resource protection in urban and suburban watersheds
[PB-298271/8] N80-11549
WAVE ATTENUATION
Electric and magnetic fields of an intense pulse of relativistic electrons propagating through air
[AD-A071621] N80-11332
WAVE DISPERSION
Scientific objective 5: Upper atmospheric waves
N80-11420
WAVE EXCITATION
Scientific objective 5: Upper atmospheric waves
N80-11420
WAVE FUNCTIONS
Spheroidal functions. Theoretical studies and computational techniques
[CNES-NT-88] N80-11819
WAVE PROPAGATION
Propagation of Lg waves across eastern Europe and Asia
[UCRL-52494] N80-11312
Radio communications at extremely high frequencies: The use of meteorological data
[FUB-27-1978] N80-11320
Test plan for intermediate range airblast propagation measurements
[SAND-78-1703] N80-11389
Scientific objective 5: Upper atmospheric waves
N80-11420
Measurement of fluorescence decay times of laser dyes, 1. Behavior of rigid and mobile media with respect to signal extraction and signal propagation, 2
[UCRL-81568] N80-11451
User's manual for the computer program TODEP --- two dimensional wave propagation
[FOA-C-20308-D4] N80-11822
Direct comparison between circularly and linearly polarized RF field in ICRF heating of a toroidal plasma
[IPPJ-416] N80-11905
WAVEGUIDES
Multihole couplers between different waveguides. Theory and experiments
[FUB-30-1978] N80-11367
Electromagnetic boundary-valve problems based upon a modification of residue calculus and function theoretic techniques
[PB-297305/5] N80-11867
WAVES
Scientific objective 5: Upper atmospheric waves
N80-11420
WEAPON SYSTEMS
Ten point six micron laser target designator
[AD-A071912] N80-11429
WEAR
Metallic wear particles: A short review
[UPTEC-78-11-R] N80-11480
Studies of abrasive wear in a modified impact testing machine --- on low carbon steels
[UPTEC-78-79-R] N80-11481
WEATHER
Scientific objective 7: Magnetospheric sun and weather relationships
N80-11422
Mariners weather log, volume 23, number 3
[PB-298738/6] N80-11741
WEATHER FORECASTING
The application of measures of synoptic similarity to the evaluation and development of atmospheric prediction models: Task 1
[AD-A073098] N80-11725
Shortrange forecasting through extrapolation of satellite imagery patterns. Part 1: Motion vector techniques
[AD-A073081] N80-11726
Design study for the development and use of model output statistics in automated aviation weather forecasting
[AD-A072849] N80-11727
Fog prediction. A bibliography with abstracts
[NTIS/PS-79/0820/5] N80-11739
The usefulness of data from mountaintop fire lookout stations in determining atmospheric stability --- determining atmospheric turbulence indexes to forecast thunderstorms
[PB-298899/6] N80-11743
Objective use of satellite data due to forecast changes in intensity of tropical disturbances
[PB-298915/0] N80-11744
The nested grid model
[PB-299046/3] N80-11745
WEATHER STATIONS
First session of the WAMEX scientific and management regional committee
[GARP-SPEC-REPT-31] N80-11731
The usefulness of data from mountaintop fire lookout stations in determining atmospheric stability --- determining atmospheric turbulence indexes to forecast thunderstorms
[PB-298899/6] N80-11743
WEIGHT [MASS]
Avionic system architecture investigation [AVSAR II]
[AD-A071743] N80-11080
WEIGHTLESSNESS
Analysis of the influence of space conditions upon reactions between liquid as well as gaseous corrosive agents and metals
[BMFT-FB-W-77-10] N80-11222
Zone crystallization under zero gravity
[BMFT-FB-W-77-12] N80-11929
Investigation of the structure of Te-Se solid solutions obtained in different gravity conditions onboard the Salyut-6 station and in the centrifuge
[D-269] N80-11934
WELD TESTS
Experimental electro-thermal method for nondestructively testing welds in stainless steel pipes
[HEDL-SA-1705] N80-11497
WELDABILITY
Effects of impurities on the weldability of electroformed nickel
[NASA-CR-162455] N80-11214
Effect of surface contamination of solid phase welding: An overview
[SAND-78-0223C] N80-11478
WELDED JOINTS
Development of laser welding techniques for joining armor
[AD-A072537] N80-11472
Development of laser welding techniques for joining armor
[AD-A072536] N80-11473
Explosive forming of butt welded pipe reducers
[AD-A072430] N80-11475
Effect of weld penetration on the stress concentration factor for cruciform welded joints
N80-11522
Stress concentration factors for fillet welded joints during bending
N80-11523
WELDING
Effect of surface contamination of solid phase welding: An overview
[SAND-78-0223C] N80-11478
WELLS
Bell Creek residual oil saturation technology test
[BETC-2180-4] N80-11546
WEST VIRGINIA
Oil recovery by carbon dioxide injection --- West Virginia
[ORO-5301-34] N80-11545
WHEELS
Hobbing ratchet wheels for miniature mechanisms
[BDX-613-1927-REV] N80-11476
WHITE NOISE
Spectral estimates of band-limited signals
[AD-A072776] N80-11306
Some methods for identification of linear systems with noisy input output data
[UPTEC-78-73-R] N80-11315
WIDE ANGLE LENSES
Wide angle optical systems --- multispectral scanner
[NASA-CASE-MSC-18373-1] N80-11892
WIENER FILTERING
Study to development gradiometer techniques --- filtering of gravity-gradiometer readings onboard
[AD-A072821] N80-11688
WIND [METEOROLOGY]
Comparison of the finite element and finite difference methods in a diagnostic regional wind field model
[UCRL-52789] N80-11728
WIND EFFECTS
Exploratory development of aircrew windblast protection concepts
[AD-A072013] N80-11055
WIND PRESSURE
Exploratory development of aircrew windblast protection concepts
[AD-A072013] N80-11055
Wind loads on flat plate photovoltaic array fields
[NASA-CR-162424] N80-11563
WIND SHEAR
Wind shear hazard definition for a wide body jet --- low level wind shear and control simulation
[FAA-RD-79-90] N80-11715
WIND TUNNEL APPARATUS
Evaluation of an ejector powered engine simulator at transonic Mach numbers
[AD-A071607] N80-11094
Experimental feasibility study of the application of magnetic suspension techniques to large-scale aerodynamic test facilities --- cryogenic traonics wind tunnel
[NASA-CR-146761] N80-11102
WIND TUNNEL TESTS
Evaluation of a wind-tunnel gust response technique including correlations with analytical and flight test results
[NASA-TP-1501] N80-11028
Aerodynamic interactions from reaction controls for lateral control of the M2-F2 lifting-body entry configuration at transonic and supersonic and supersonic Mach numbers --- wind tunnel tests
[NASA-TM-78534] N80-11033
Wind-tunnel/flight correlation study of aerodynamic characteristics of a large flexible supersonic cruise airplane CXB-70-1]. 1: Wind-tunnel tests of a 0.03-scale model at Mach numbers from 0.6 to 2.53
[NASA-TP-1514] N80-11068
WIND TUNNEL WALLS
The measurement of film cooling effectiveness in short duration wind tunnels
[VKI-TN-127] N80-11108
WIND VELOCITY MEASUREMENT
Aeronomical sounding rocket program. Results of the foil cloud experiment flown on the payload B1 of the National Aeronomy Program Winter Anomaly and Trace Constituents at El Aernosillo, Spain, December 1975 to February 1976
[BMFT-FB-W-78-16] N80-11703
WINDMILLS [WINDPOWERED MACHINES]
Interaction in limited arrays of windmills: Review of earlier results from a simple model and a presentation of the capabilities of a dynamic PBL model
[DM-26] N80-11631
WINDPOWER UTILIZATION
Wind energy systems: Program summary
[DOE/ET-0093] N80-11578
Status of information for consumers of small wind energy systems
[SERI/TP-51-158] N80-11602

WINDPOWERED GENERATORS
Executive summary: Mod-1 wind turbine generator analysis and design report
[NASA-CR-159497] N80-11558
WING FLOW METHOD TESTS
Harmonic oscillations of annular wing in steady ideal fluid flow
N80-11019
WING OSCILLATIONS
A comparison of the pitching and plunging response of an oscillating airfoil
[NASA-CR-3172] N80-11030
WING PANELS
On solution of the plane problem of reinforced panels of variable stiffness
N80-11004
Flight simulation fatigue crack propagation evaluation of candidate lower wing skin materials with particular consideration of spectrum truncation
[NLR-TR-77092-U] N80-11524
WING PROFILES
Analytic formulas for wing profile aerodynamic characteristics in incompressible flow
N80-11010
Solution of the inverse aerodynamics problem by the random search method
N80-11013
Harmonic oscillations of annular wing in steady ideal fluid flow
N80-11019
Comparison of boundary layer calculation for a wing: The May 1978 Stocholm workshop test case --- computerized simulation
[FFA-AE-1522] N80-11046
Design of the Spar-Wingskin Joint
[AD-A072426] N80-11072
WINGS
On a smooth approximation method and its application to mathematical description of wing aerodynamic characteristics
N80-11011
Influence of wing deformation on trailing-edge flap deflections
N80-11012
WIRING
True-integrating environmental noise monitor and sound exposure level meter. Volume 2: Wiring and parts lists, parts layouts, and schematics
[AD-A072002] N80-11871
WORDS [LANGUAGE]
The rhymed words method of measuring the intelligibility index in audiometric work. The influence of open and closed vowels
[FUB-1-1979] N80-11324
WORKING FLUIDS
Composition stability and degradation products of selected materials for solar heating and cooling
[SAND-78-0681] N80-11591
WORKLOADS [PSYCHOPHYSIOLOGY]
Performance, physiological, and oculometer evaluation of VTOL landing displays
[NASA-CR-3171] N80-11771
WORLD DATA CENTERS
World Weather Watch: Consolidated report on the Voluntary Assistance Programme including projects approved for circulation in 1978
[WMO-525] N80-11732
Report of activities on world meteorological research, applications and water resources development
[WMO-529] N80-11733
WORLD METEOROLOGICAL ORGANIZATION
World Weather Watch: Consolidated report on the Voluntary Assistance Programme including projects approved for circulation in 1978
[WMO-525] N80-11732
Report of activities on world meteorological research, applications and water resources development
[WMO-529] N80-11733

X

X RAY ANALYSIS
X-ray excited optical luminescence of polynuclear aromatic hydrocarbons
[IS-T-856] N80-11165
X RAY DIFFRACTION
Influence of multiaxial stress states, stress gradients and elastic anisotropy on the evaluation of residual stresses by X-rays
[AD-A067909] N80-11190
X RAY SOURCES
Low latitude atmospheric X-rays observed by HEAO-1
[AD-A072722] N80-11684

Y

YAG LASERS
Neodymium YAG lasers. Citations from the international aerospace abstracts data base
[NTIS/PS-79/0862/7] N80-11461
Neodymium YAG lasers. A bibliography with abstracts
[NTIS/PS-79/0883/3] N80-11466
YIELD STRENGTH
On the influence of nickle on toughness and ductile-brittle transition in low-carbon lath martensite steels
[UPTEC-78-53-R] N80-11223
YTTRIUM OXIDES
Evaluation of yttriated titanium 6 Al-4 V plates and forgings
[AD-A072439] N80-11196

Z

ZEOLITES
Surface reactions of oxides of sulfur
[PB-297410/3] N80-11183
ZETA PINCH
Relaxation of Z discharge between electrodes --- using Taylor series to find final relaxation of zeta pinch magnetohydrodynamic stability
[IPPJ-414] N80-11903
ZINC
A field study of the relationship between heavy metal concentrations in stream water and selected benthic macroinvertebrate species
[PB-297284/2] N80-11651
ZONE MELTING
Zone crystallization under zero gravity
[BMFT-FB-W-77-12] N80-11929

PERSONAL AUTHOR INDEX

Typical Personal Author Index Listing

PERSONAL AUTHOR

AARON, W. S. N80-10690

NASA ACCESSION NUMBER

Listings in this Index are arranged alphabetically by personal author. The NASA accession number denotes the number by which the citation is identified.

CORPORATE SOURCE INDEX

Typical Corporate Source Index Listing

Listings in this index are arranged alphabetically by corporate source. The title of the document provides the user with a brief description of the subject matter. The report number helps to indicate the type of document cited (e.g., NASA report, translation, NASA contractor report). The NASA accession number denotes the number by which the citation is identified. The titles are arranged under each corporate source in ascending accession number order.

A

ACADEMY OF SCIENCES [USSR], MOSCOW.
The effect of the magnetosphere processes on the ionosphere during the magnetic storm of December 1, 1977 based on the Cosmos-900 data
[D-277] N80-11709
Crystal growth from the vapor phase with an inert component present
[D-269] N80-11933
Investigation of the structure of Te-Se solid solutions obtained in different gravity conditions onboard the Salyut-6 station and in the centrifuge
[D-269] N80-11934
Polarization and anisotropy of the relict radiation in an anisotropic universe
[PR-486] N80-11971

ACUREX CORP., MOUNTAIN VIEW, CALIF.
Extended tests of Saffil aluminum filter media
[PB-297567/0] N80-11652
Technical assessment of thermal DeNOx process
[PB-297947/4] N80-11656

ADAPTRONICS, INC., MCLEAN, VA.
Exploratory development of adhesive bond flaw detection
[AD-A072724] N80-11496

ADDIS TRANSLATIONS INTERNATIONAL, PORTOLA VALLEY, CALIF.
Conversion of radiant energy into chemical energy
[UCRL-TRANS-11427] N80-11609
Construction of the equation of state for chemical compounds
[UCRL-TRANS-11474] N80-11937

AEG-TELEFUNKEN, BERLIN [WEST GERMANY].
Unconventional circuits for static voltage transformers
[BMFT-FB-T-79-26] N80-11368

AERONAUTICAL RESEARCH INST. OF SWEDEN, STOCKHOLM.
Measurements on a three-dimensional swept wing at low speeds. Part 1: The flow around the leading edge
[FFA-130-PT-1] N80-11044
Measurements on a three-dimensional swept wing at low speeds. Part 2: The flow in the boundary layer on the main wing
[FFA-131-PT-2] N80-11045
Comparison of boundary layer calculation for a wing. The May 1978 Stockholm workshop test case
[FFA-AE-1522] N80-11046
An experimental survey of a separated region on a conical afterbody in a supersonic free stream
[FFA-TN-AU-1187] N80-11047
A survey of the literature on surface roughness effects on the drag of subsonic aircraft
[FFA-AU-1224] N80-11049
Influence of environmental cycling on the mechanical properties of composite materials, part 2
[FFA-TN-HU-1653-1-PT-2] N80-11155
The influence on the fatigue properties of aluminum AZ 74 from process variants in sulphuric acid anodizing
[FFA-TN-HU-1963] N80-11220
Fatigue testing of precipitating steel 1745 [Custom 455] with machining as the final process
[FFA-TN-HU-1967] N80-11221
Fatigue testing of forged titanium
[FFA-HU-1997] N80-11224

AERONAUTICAL RESEARCH LABS., MELBOURNE [AUSTRALIA].
Prediction of helicopter rotor downwash in hover and vertical flight
[ARL-AERO-REPT-150] N80-11032

AEROSPACE CORP., EL SEGUNDO, CALIF.
Global lightning distribution at dawn and dusk for August-December 1977 as observed by the DMSD lightning detector
[AD-A071896] N80-11678
Low latitude atmospheric X-rays observed by HEAO-1
[AD-A072722] N80-11684
Is the sun constant?
[ATR-79(9552)-4] N80-11981

AIR FORCE ACADEMY, COLO.
FALCONSPIR. A multi-modal approach to fix computation
[AD-A072527] N80-11059

AIR FORCE AERO PROPULSION LAB., WRIGHT-PATTERSON AFB, OHIO.
A FORTRAN algorithm for plotting contours over a triangular mesh
[AD-A072527] N80-11811

AIR FORCE FLIGHT DYNAMICS LAB., WRIGHT-PATTERSON AFB, OHIO.
Optimum shape for transpiration-cooled nosetip of a reentry vehicle
[AD-A072296] N80-11118

AIR FORCE GEOPHYSICS LAB., HANSCOM AFB, MASS.
Report on Peru scintillation tests, March 1978
[AD-A072996] N80-11685
Correlation studies of protonospheric electron content over the US continent
[AD-A073080] N80-11686
A case study of S3-2 observations in the late evening auroral oval
[AD-A072986] N80-11692
Study of the equatorward edge of the auroral oval from satellite observations
[AD-A072997] N80-11693
Phase space coordinates of long lifetime trapped radiation from Stormer Mapping
[AD-A072995] N80-11694
A dynamical model for the onset of magnetospheric substorms
[AD-A072987] N80-11695
Shortrange forecasting through extrapolation of satellite imagery patterns. Part 1: Motion vector techniques
[AD-A073081] N80-11726
Design study for the development and use of model output statistics in automated aviation weather forecasting
[AD-A072849] N80-11727

AIR FORCE INST. OF TECH., WRIGHT-PATTERSON AFB, OHIO.
The use of the Maurer factor for estimating the cost of a turbine engine in the early stages of development
[AD-A073018] N80-11095
Electric and magnetic fields of an intense pulse of relativistic electrons propagating through air
[AD-A071621] N80-11332

AIR FORCE LOGISTICS COMMAND, WRIGHT-PATTERSON AFB, OHIO.
Opportunistic Maintenance Engine Simulation model: OMENS 2
[AD-A072516] N80-11088

AIR FORCE MATERIALS LAB., WRIGHT-PATTERSON AFB, OHIO.
Potential chemical systems for intramolecular cycloaddition cures
[AD-A072526] N80-11152
Evaluation of vitreated titanium 6 Al-4 V plates and forgings
[AD-A072439] N80-11196

AIR FORCE WEAPONS LAB., KIRTLAND AFB, N. MEX.
Modeling studies of the mixing and chemistry of the NF radicals on the wintream nozzle
[AD-A071317] N80-11440

AIR POLLUTION TECHNOLOGY, INC., SAN DIEGO, CALIF.
Mobile bed flux force/condensation scrubbers
[PB-297198/4] N80-11657

AIRESEARCH MFG. CO., TORRANCE, CALIF.
Near-term electric vehicle program: Phase 2: Mid-term summary report
[SAN-1213-02] N80-11956

ALASKA UNIV., FAIRBANKS.
Non-neutral field-aligned current sheet and auroral electric field
[AD-A072852] N80-11687

ALLERTON PRESS, INC., NEW YORK, N. Y.
Soviet Aeronautics, volume 21, no. 2
N80-11002
Experimental study of shell stability under heating and loading
N80-11003
On solution of the plane problem of reinforced panels of variable stiffness
N80-11004
Surface-effect components of aerodynamic characteristics of air-cushion vehicle with ram pressurization
N80-11005
Statistical diagnostics aircraft engines
N80-11006
Optimal thermogasdynamic design of gas turbine engines using element prototypes, 1
N80-11007
Aerodynamic heating of blunt wedges
N80-11008
Selection of geometric parameters and location of nose flap on swept wing root profile from tunnel test data, 1
N80-11009
Analytic formulas for wing profile aerodynamic characteristics in incompressible flow
N80-11010
On a smooth approximation method and its application to mathematical description of wing aerodynamic characteristics
N80-11011
Influence of wing deformation on trailing-edge flap deflections
N80-11012
Solution of the inverse aerodynamics problem by the random search method
N80-11013
Analytic design of complex systems, 1
N80-11014
On the limit state of a toroidal shell of revolution under axisymmetric deformation
N80-11015
Optimal object control with worst random parameter distribution
N80-11016
Load-carrying ability of cylindrical shell loaded by concentrated force acting along the generator
N80-11017
Numerical integration of equations of theory of thin-wall beams with deformable contour
N80-11018
Harmonic oscillations of annular wing in steady ideal fluid flow
N80-11019
Analytic design of regulators for variable-parameter systems
N80-11020
On the damping effect in surface plastic deformation
N80-11021
Overall aerodynamic characteristics of caret and delta wings at supersonic speeds
N80-11022
Determination of loads and stress in composite material layers for a plate in the plane stress state
N80-11023
Selecting the passenger airplane fuselage
N80-11024
Influence of contour deformation in prebuckling state on bending stability of open cylindrical shells
N80-11025
Mixed inverse problem for profile with given velocity distribution on one side and known thickness law
N80-11026
On free periodic parachute system oscillations in the axial plane
N80-11027

AMES LAB., IOWA.
X-ray excited optical luminescence of polynuclear aromatic hydrocarbons
[IS-T-856] N80-11165

SOURCE

Analysis of backmixing and mass transfer in solvent extraction columns
[IS-T-851] N80-11166
Chromatography of metal ions with a triazine chelating resin
[IS-T-855] N80-11167
Partial molar volumes of hydrogen and deuterium in niobium and vanadium
[IS-T-839] N80-11172
Inductively coupled plasma-atomic emission spectroscopy: An evaluation of the use of nitrogen-argon admixtures as plasma discharge atmospheres
N80-11177
Annealing of neutron-irradiated vanadium containing oxygen
[IS-T-816] N80-11215
Structural study of high temperature metal-rich titanium sulfide phases
[IS-T-832] N80-11216
Thermal expansion of glasses at low temperatures
[IS-T-829] N80-11234

ANTHROPOLOGY RESEARCH PROJECT, YELLOW SPRINGS, OHIO.
Height/weight sizing programs for womens protective garments
[AD-A072376] N80-11781

APPLIED PHYSICS LAB., JOHNS HOPKINS UNIV., LAUREL, MD.
Instrumentation developed by the Johns Hopkins University Applied Physics Laboratory for non-APL spacecraft
[AD-A072438] N80-11135

ARGONNE NATIONAL LAB., ILL.
Photo ion mass spectrometry and photoelectron spectroscopy of high temperature vapors
[CONF-780941-4] N80-11174
Resonance Raman spectra of metal halide vapor complexes
[CONF-780941-8] N80-11175
High precision metal stable isotope ratio measurements using volatile metal chelates
[CONF-780501-7] N80-11211
Design of a tunable high-Q superconducting notch filter
[ANL-78-91] N80-11358
Heat pump centered integrated community energy systems; System development
[ANL-ICES-TM-28] N80-11574
Transfer of energy conservation technology to industry. A preliminary survey of existing mechanisms
[ANL/EES-TM-28] N80-11576
Implementing energy conservation strategies in energy materials transport: U. S. Department of Energy and other government agency policy-making decisions
[ANL/EES-TM-32] N80-11577
DOE heat pump centered integrated community energy systems project
[CONF-790362-1] N80-11586
World Energy Data System [WENDS]
[CONF-790461-2] N80-11587
Chemical engineering division basic energy sciences research
[ANL-78-42] N80-11610
Preliminary materials assessment in solar demonstration systems
[ANL/EES-CP-30] N80-11619
Underground pumped hydro storage: An overview
[CONF-781046-1] N80-11624
Evaluation of turbomachinery for compressed air energy storage plants
[CONF-781046-6] N80-11625
Design optimization of aquifer reservoir-based compressed air storage systems
[CONF-781046-5] N80-11628

ARINC RESEARCH CORP., ANNAPOLIS, MD.
Avionics master plan data base mechanization architecture
[AD-A071545] N80-11083

ARMY AEROMEDICAL RESEARCH LAB., FORT RUCKER, ALA.
In-flight performance evaluation of experimental information
[AD-A071701] N80-11084
A porcine bioassay method for analysis of thermally protective fabrics: A clinical grading system
[AD-A069202] N80-11766
Head aiming/tracking accuracy in a helicopter environment
[AD-A071359] N80-11788

ARMY ARMAMENT RESEARCH AND DEVELOPMENT COMMAND, ABERDEEN PROVING GROUND, MD.
Infrared absorption by water clusters
[AD-A071455] N80-11895

ARMY AVIATION RESEARCH AND DEVELOPMENT COMMAND, ST. LOUIS, MO.
SCHEDULE. Managerial tool for project/product managers
[AD-A072140] N80-11257

ARMY COLD REGIONS RESEARCH AND ENGINEERING LAB., HANOVER, N. H.
Detection of arctic water supplies with geophysical techniques
[AD-A072157] N80-11538

ARMY CONSTRUCTION ENGINEERING RESEARCH LAB., CHAMPAIGN, ILL.
The Building Loads Analysis and System Thermodynamics [BLAST] program, version 2.0. Users manual, volume 1
[AD-A072272] N80-11258
The Building Loads Analysis System Thermodynamics [BLAST] program version 2.0 Input booklet
[AD-A072435] N80-11259
True-integrating environmental noise monitor and sound exposure level meter. Volume 2: Wiring and parts lists, parts layouts, and schematics
[AD-A072002] N80-11871

ARMY ELECTRONICS RESEARCH AND DEVELOPMENT COMMAND, FORT MONMOUTH, N. J.
Resonators for acceleration environments
[AD-A072741] N80-11924

ARMY ELECTRONICS RESEARCH AND DEVELOPMENT COMMAND, WHITE SANDS MISSILE RANGE, N. MEX.
The 19305A GSRS missile number 1025, round number V-33
[AD-A071894] N80-11718
The 19305A GSRS missile number 1055 round number V-31
[AD-A071880] N80-11719

ARMY ENGINEER TOPOGRAPHIC LABS., FORT BELVOIR, VA.
Land cover classification from Landsat data: Phase 3 of a joint DOE/NASA demonstration
[AD-A071723] N80-11535

ARMY MATERIALS AND MECHANICS RESEARCH CENTER, WATERTOWN, MASS.
HPLC monitoring of graphite-epoxy prepreg aging
[AD-A072294] N80-11150

ARMY MATERIEL DEVELOPMENT AND READINESS COMMAND, ALEXANDRIA, VA.
Engineering design handbook. Joining of advanced composites
[AD-A072362] N80-11148

ARMY MISSILE RESEARCH AND DEVELOPMENT COMMAND, REDSTONE ARSENAL, ALA.
Tri-FAST hardware-in-the-loop simulation. Volume 1: Tri-FAST hardware-in-the-loop simulation at advanced simulation center
[AD-A072919] N80-11063
Distributed source generation for RF environmental modeling for hardware-in-the-loop missile guidance simulation
[AD-A072927] N80-11126
Compilation of data relevant to nuclear pumped lasers, volume 1
[AD-A071360] N80-11437
Laser induced luminescence of military targets
[AD-A073200] N80-11441

ARMY RESEARCH INST. OF ENVIRONMENTAL MEDICINE, NATICK, MASS.
The 5-thio-d-glucose thermoregulatory effects in mice at various temperatures
[AD-A069511] N80-11757
Hypothermia induced by chlorpromazine or L-tryptophan effects on treadmill performance in the heat
[AD-A069849] N80-11764
Cold air inhalation, esophageal temperature lung function in exercising humans
[AD-A069510] N80-11765

ARMY TROPIC TEST CENTER APO, MIAMI 34004.
Materiel testing in the tropics
[AD-A072434] N80-11489

ARO, INC., ARNOLD AIR FORCE STATION, TENN.
Evaluation of an ejector powered engine simulator at transonic Mach numbers
[AD-A071607] N80-11094
Infrared optical properties of bipropellant cryocontaminants
[AD-A073186] N80-11242

ATMOSPHERIC SCIENCES LAB., WHITE SANDS MISSILE RANGE, N. MEX.
Accuracy validation of the modified Nike Hercules radar
[AD-A071720] N80-11291

AUSTRIAN SOLAR AND SPACE AGENCY, VIENNA.
Solar energy with latent heat storage: Fundamentals and applications
[ASSA-10/1978] N80-11632

B

BALA, CUPERTINO, CALIF.
Design of an experimental program for evaluation of LBR systems
[AD-A071526] N80-11433

BALLISTIC RESEARCH LABS., ABERDEEN PROVING GROUND, MD.
Workshop report: Fundamental reactions in solid propellant combustion
[AD-A072162] N80-11239

BARI UNIV. [ITALY].
Off-design performance prediction of radial inflow turbines, volume 2
N80-11479
A comparison of five methods for calculating the exhaust flow from internal combustion engines
N80-11482
Exhaust flow simulation fo a one cylinder engine with a divergent exhaust pipe
N80-11483
Structural analysis of a 15,000 tons 'O' press
N80-11484
On the off-design performance of small radial turbines
N80-11485
Effect of weld penetration on the stress concentration factor for cruciform welded joints
N80-11522
Stress concentration factors for fillet welded joints during bending
N80-11523
On the numerical solution of Cauchy integrals
N80-11853

BARNES ENGINEERING CO., STAMFORD, CONN.
Wide angle optical systems
[NASA-CASE-MSC-18373-1] N80-11892

BATTELLE COLUMBUS LABS., OHIO.
Evaluation criteria for commercially oriented materials processing in space proposals
[NASA-CR-162437] N80-11112
SEASAT demonstration experiments with the offshore oil, gas and mining industries
[NASA-CR-162423] N80-11532
An economic analysis of five selected LANDSAT assisted information systems in Oregon
[NASA-CR-162434] N80-11533
Preliminary assessment of industrial needs for an advanced ocean technology
[NASA-CR-162435] N80-11747

BATTELLE INST., FRANKFURT AM MAIN [WEST GERMANY].
Development of starting points for a selective support program for civil avionics technologies
[BMFT-FB-W-78-21] N80-11086

BATTELLE PACIFIC NORTHWEST LABS., RICHLAND, WASH.
User manual for GEOCITY: A computer model for geothermal district heating cost analysis
[PNL-2742] N80-11605

BEECH AIRCRAFT CORP., BOULDER, COLO.
PRSA hydrogen tank thermal acoustic oscillation study
[NASA-CR-152319] N80-11470

BENDIX CORP., KANSAS CITY, MO.
Coating laminated substrates
[BDX-613-2062-REV] N80-11153
Pulse plating of hard gold electrodeposits
[BDX-613-2165] N80-11207
Characterization of low density rigid urethane foam
[BDX-613-1890-REV] N80-11232
Shelf life determination of epoxy prepregs and film adhesives
[BDX-613-2033-REV] N80-11233
Electrochemical deburring: Another sharp sword in the battle with burrs
[BDX-613-2132] N80-11262
Reliability of packaged beam-lead transistors built with different pre-seal assembly techniques
[BDX-613-1952-REV] N80-11349
Hermetic sealing of hybrid microcircuits: Initial capability development
[BDX-613-1930-REV] N80-11350
Electrical compensation system for plated-through-hole tester: Milestone Report
[BDX-613-1943-REV] N80-11354
Static elimination work stations
[BDX-613-1953-REV] N80-11355
Laser welding of electrical interconnections
[BDX-613-2022-REV] N80-11356
Effects of gas plasma on printed circuit board materials
[BDX-613-2030-REV] N80-11357
Automated monitoring of thin film capacitors for electrical breakdown
[BDX-613-2076-REV] N80-11359
Cooling aluminum molds using heat pipes
[BDX-613-2039-REV] N80-11384
Laser-beam profiler and detector-surface scanner
[BDX-613-1841-REV] N80-11448
Characteristics of laser cutting Kevlar laminates
[BDX-613-2075-REV] N80-11456
Hobbing ratchet wheels for miniature mechanisms
[BDX-613-1927-REV] N80-11476

BETTIS ATOMIC POWER LAB., WEST MIFFLIN, PA.
MDSFP: A computer program for elastic solution of three dimensional structures by the finite element method [LWBR development program]
[WAPD-TM-1187] N80-11816

BIONETICS CORP., HAMPTON, VA.
Small conductive particle sensor
[NASA-CASE-LAR-12552-1] N80-11400

BITUMINOUS COAL RESEARCH, INC., MONROEVILLE, PA.
Gas generator research and development: BI-GAS process
[FE-1207-49] N80-11588

BOEING AEROSPACE CO., HOUSTON, TEX.
STARPAHC space-oriented medical evaluation
[NASA-CR-160360] N80-11763

BOEING AEROSPACE CO., SEATTLE, WASH.
Evaluation of dais technology applied to the integrated navigation system of a tactical transport
[AD-A073068] N80-11061

Solar power satellite system definition study, phase 2.
[NASA-CR-160377] N80-11121
Solar power satellite system definition study, phase 2. Part 1: Midterm briefing
[NASA-CR-160378] N80-11122
Solar power satellite system definition study
[NASA-CR-160368] N80-11123
Optical power spectrum analysis of processed imagery
[AD-A073083] N80-11335

BOEING COMMERCIAL AIRPLANE CO., SEATTLE, WASH.
Linear systems analysis program. L224[QR]. Volume 2: Supplemental system design and maintenance document
[NASA-CR-2862] N80-11098

BOEING ENGINEERING AND CONSTRUCTION, SEATTLE, WASH.
Wind loads on flat plate photovoltaic array fields
[NASA-CR-162424] N80-11563

BOLT, BERANEK, AND NEWMAN, INC., CAMBRIDGE, MASS.
Development of a voice funnel system
[AD-A072424] N80-11295
Development of a voice funnel system
[AD-A072423] N80-11296

BOOZ-ALLEN AND HAMILTON, INC., BETHESDA, MD.
Categorization and specification requirements for a common family of AUTODIN terminals
[AD-A072164] N80-11287
Integrated Autodin System [IAS]: Generation of viable far-term architectures for IAS
[AD-A072165] N80-11288

BRAUN [C. F.] AND CO., ALHAMBRA, CALIF.
Experimental enthalpies for a mixture of 80 mole percent isobutane in isopentane
[EPRI-ER-1034] N80-11935

BRITISH AEROSPACE DYNAMICS [SPACE], STEVENAGE [ENGLAND].
Pallet-only configuration improvement study: Technical summary report
[RAE-TP-7717] N80-11132

BRITISH BROADCASTING CORP., KINGSWOOD [ENGLAND].
Satellite broadcasting: Results of a preliminary coverage survey in the UK
[BBC-RD-1979/18] N80-11270
Digital sound: Sampling-rate synchronisation by variable delay
[BBC-RD-1979/17] N80-11271

BROOKHAVEN NATIONAL LAB., UPTON, N. Y.
Free electron laser and its possible developments
[BNL-25857] N80-11445
Case study of the Brownell low energy requirement house, thermal storage analysis
[BNL-25832] N80-11584
Regional reference energy systems: Electric utility applications
[BNL-50962] N80-11585
Environmental control technology for carbon dioxide
[BNL-24999] N80-11639
Blackouts and brownouts and their effect on computer operations
[BNL-24960] N80-11798
Informal conference on Status and Future of Solar Neutrino Research; proceedings
[BNL-50879-VOL-2] N80-11890

BROOKLYN UNION GAS CO., N. Y.
Methane recovery from sanitary landfills; gas recovery system installation and testing
[PB-296622/4] N80-11254

BROWN UNIV., PROVIDENCE, R. I.
Control of nonlinear systems
[AD-A072635] N80-11829
Measure-valued processes in the control of partially-observable Stochastic systems
[AD-A072070] N80-11830
Unitarity restrictions on semi-classical approximations to certain functional integrals
[COO-3137A-343] N80-11852
Structural related research
[AD-A071416] N80-11988

BRUNSWICK CORP., DELAND, FLA.
Development of improved abradable compressor gas path seal
[AD-A072171] N80-11474

BUNDESMINISTERIUM FUER FORSCHUNG UND TECHNOLOGIE, BONN [WEST GERMANY].
Planning synthesis for Spacelab projects in communication and navigation
[BMFT-FB-W-78-30] N80-11116

BUREAU OF MINES, RENO, NEV.
Platinum-substitute materials as electrocatalysts for oxygen reduction
[PB-297261/0] N80-11186

C

CALIFORNIA INST. OF TECH., PASADENA.
Similarities and differences between electron and proton transfers at electrodes and in solution
[AD-A073001] N80-11162
Discontinuous deformation gradients in the finite twisting of an incompressible elastic tube
[AD-A071728] N80-11507

CALIFORNIA UNIV., BERKELEY.
Adsorption of oxygen on Pt [111] and its reactivity to hydrogen and carbon monoxide
[AD-A072710] N80-11198
Gas flow through porous barriers
[LBL-8283] N80-11388
The scope, limits, and training implications of three models of aircraft pilot emergency response behavior
[AD-A071320] N80-11773

CALIFORNIA UNIV., BERKELEY. LAWRENCE BERKELEY LAB.
Deep level transient spectroscopy of high purity germanium diodes/detectors
[LBL-8140] N80-11176
Noise and optimization of the dc SQUID
[LBL-8510] N80-11345
One shots and alternatives in synchronous digital system design
[LBL-8722] N80-11353
On-line tests of organic additives for the inhibition of the precipitation of silica from hypersaline geothermal brine. 2: Tests of nitrogen-containing compounds, silanes, and additional ethoxylated compounds
[UCID-18195] N80-11567
Geothermal energy for industrial application
[LBL-8919] N80-11579
Energy conservation: Policy issues and end-use scenarios of savings potential. Part 3: Policy barriers and investment decisions in industry
[LBL-7896-PT-3] N80-11614
Computer mapping software at the Lawrence Berkeley Laboratory
[LBL-7938] N80-11818
Study by elastic theory of the clustering of solute atoms during the early stage of solid solution decomposition
[LBL-7680] N80-11880
Ellipsometry of surface layers on lead and lithium
[LBL-8375] N80-11926
Ellipsometry of anodic film growth
[LBL-8082] N80-11927
The effect of crystal growth direction on the energy resolution of high-purity germanium detectors
[LBL-8133] N80-11928
Thermodynamics of high temperature brines
[LBL-8973] N80-11936
A manual for cataloging and indexing documents
[LBL-4432-REV-1] N80-11946

CALIFORNIA UNIV., DAVIS.
Bathtub and related failure rate characterizations
[AD-A072626] N80-11490
Interaction of low levels of ozone and relative humidity on leafy vegetables
[PB-297062/2] N80-11658

CALIFORNIA UNIV., LIVERMORE. LAWRENCE LIVERMORE LAB.
Mach 130 air shock attenuation studies
[UCRL-82012] N80-11043
Analysis of beryllium parts for cosmos 954
[UCRL-52597] N80-11127
Calculation of chemical equilibrium between aqueous solution and minerals: The EQ3/6 software package
[UCRL-52658] N80-11169
Laboratory coal gasifier facility
[UCRL-82602] N80-11245
Behavior of lightly confined high explosives in a jet-fuel fire
[UCRL-52659] N80-11247
Propagation of Lg waves across eastern Europe and Asia
[UCRL-52494] N80-11312
Two-dimensional transient dispersion and adsorption in porous media
[UCRL-81970] N80-11386
Special session on streak camera dynamic range measurement definition
[UCRL-81704] N80-11408
Advanced lasers for fusion applications
[UCRL-81940] N80-11442
Flourescence diagnostics in two-step laser excitation of high J atoms
[UCRL-81746] N80-11449
Measurement of fluorescence decay times of laser dyes, 1. Behavior of rigid and mobile media with respect to signal extraction and signal propagation, 2
[UCRL-81568] N80-11451
Effects of longitudinal electric self-field on the acceptable energy spread in a free electron laser
[UCID-17985] N80-11452
Janus neodymium glass laser operations manual
[UCID-17952] N80-11453
Laser induced fluorescence extension to non-fluorescent materials
[UCRL-81837] N80-11454
Laser induced damage in fluoride glasses: A status report
[UCRL-81358] N80-11455
Stress-rupture life of Kevlar/epoxy spherical pressure vessels
[UCID-17755-PT-3] N80-11515
On-line structural response analysis: Using the extended Kalman estimator/identifier
[UCID-18175] N80-11516
Materials program for fiber composite flywheels
[UCRL-81724] N80-11618
Seismic safety margins research program overview
[UCRL-81884] N80-11696
Predicting solar energy fluxes in polluted urban areas
[UCRL-82080] N80-11698
Comparison of the finite element and finite difference methods in a diagnostic regional wind field model
[UCRL-52789] N80-11728
Future trends in data base software
[UCRL-82619] N80-11817
Magnetic propulsion railguns: Their design and capabilities
[UCRL-82677] N80-11866
Limitations to the use of two-dimensional thermal modeling of a nuclear waste repository
[UCID-18101] N80-11888
Fresnel zone correction plates for the electron microscope
[UCRL-TRANS-11440] N80-11900
Magnetic mirror fusion research at the Lawrence Livermore Laboratory
[UCRL-82318] N80-11908

CALIFORNIA UNIV., LOS ANGELES.
Entrophy analysis of feedback flight dynamic control systems
[AD-A072259] N80-11100

CALIFORNIA UNIV., RIVERSIDE.
Seismic refraction investigation of the Salton Sea geothermal area, Imperial Valley, California
[PB-296547/3] N80-11711

CAMBRIDGE SYSTEMATICS, INC., MASS.
Directions to improve urban travel demand forecasting: Conference summary and white papers
[PB-297409/5] N80-11959

CAMBRIDGE UNIV. [ENGLAND].
Celestial observation and related work
N80-11968

CANYON RESEARCH GROUP, INC., WESTLAKE VILLAGE, CALIF.
Development of unit training and evaluation techniques for combat-ready helicopter pilots. Task 2: Assessment of ARTEP and ATM training objectives and requirements for maintaining operational readiness
[AD-A069224] N80-11776
Development of unit training and evaluation techniques for combat-ready helicopter pilots. Task 1: Development of an instruction program for individual and unit training with combat-ready pilots
[AD-A069242] N80-11777

CAPITAL SYSTEMS GROUP, ROCKVILLE, MD.
Development of a planning guide to innovation in the dissemination of scientific information
[PB-296537/4] N80-11949

CARNEGIE-MELLON UNIV., PITTSBURGH, PA.
Further measurements of the specific heats at low temperatures in metallic glasses
[UCRL-13908] N80-11231
An experiment in distributed interpretation
[AD-A072558] N80-11792

CELANESE RESEARCH CO., SUMMIT, N.J.
High flux PBI reverse osmosis membranes for desalination and water reuse
[PB-297285/9] N80-11184

CENTER FOR ASTROPHYSICS, CAMBRIDGE, MASS.
Comets, carbonaceous chondrites, and interstellar clouds: Condensation of carbon
N80-11976

CENTRAL ELECTRICITY GENERATING BOARD, BERKELEY [ENGLAND].
An abrading system for the measurement of oxide thickness
[TDB-319] N80-11411

CENTRAL ELECTRICITY GENERATING BOARD, BRISTOL [ENGLAND].
Glass fibre reinforced, sprayed coating for sealing thermal insulation containing asbestos
[TDB-325] N80-11237

CENTRAL ELECTRICITY GENERATING BOARD, HEYSHAM [ENGLAND].
Improvements in apparatus for pH measurement of water
[TDB-320] N80-11412
Laser scanning camera
[TDB-324] N80-11457

CENTRE DE RECHERCHES EN PHYSIQUE DE L'ENVIRONNEMENT TERRESTRE ET PLANETAIRE, ORLEANS [FRANCE].
On the boundary layer between a flowing plasma and a magnetic field. Part 1. The conditions for equilibrium
[CRPE-NT-63-PT-1] N80-11921

CENTRE NATIONAL D'ETUDES SPATIALES, TOULOUSE [FRANCE].
Analysis and Design of a phase linearization system for traveling wave tube amplifiers
[CNES-NT-86] N80-11362
On the use of a semi-automated test system for measuring the characteristics and/or the 'S' parameters of a quadrupolar network
[CNES-NT-87] N80-11363
The dynamic response of solar cells
[CNES-NT-85] N80-11629

Spheroidal functions. Theoretical studies and computational techniques
[CNES-NT-88] N80-11819
CENTRE NATIONAL DE RECHERCHES DE L'ESPACE, BRUSSELS [BELGIUM].
Space research in Belgium, 1978
N80-11997
CHALMERS UNIV. OF TECHNOLOGY, GOTEBORG [SWEDEN].
Spectrally selective surfaces with coatings comprised of ultrafine metal particles
[AED-CONF-78-212-004] N80-11620
On the lengths of the pieces of a stick broken at random
[CTH-MATH-1979-13] N80-11860
CHARLES RIVER ASSOCIATES, INC., BOSTON, MASS.
Development of a model of the demand for scientific and technical information services
[PB-297826/0] N80-11940
CIVIL AEROMEDICAL INST., OKLAHOMA CITY, OKLA.
Interstimulus interval as it affects temporary threshold shift in serial presentations of loud tones
[AD-A072006] N80-11762
COAST GUARD, WASHINGTON, D.C.
Life raft study, February 1978
[AD-A073055] N80-11056
COLORADO STATE UNIV., FORT COLLINS.
Convection induced temperature change in GATE
[PB-298130/6] N80-11712
Satellite support to HIPLEX. Summary of results, 1976 - 1978
[PB-297839/3] N80-11729
Interannual variability of the ocean atmosphere system
[NASA-CR-162456] N80-11730
The dynamics of equatorial mass-flow adjustment
[PB-297992/0] N80-11740
COLORADO UNIV. AT BOULDER.
Optical and discharge studies of novel electronic transition laser species
[AD-A071853] N80-11439
Quantitative synthesis of multiple loop feedback systems with large plant uncertainty
[AD-A072644] N80-11833
COMMITTEE ON COMMERCE, SCIENCE, AND TRANSPORTATION [U. S. SENATE].

[AD-A072632] N80-11793
TEXAS UNIV., AUSTIN.
Tertiary oil recovery processes research at the University of Texas
[BETC-0001-1] N80-11544
TEXAS UNIV. AT AUSTIN.
Supersonic flow measurements in the body vortex wake of an Ogive nose cylinder
[AD-A071337] N80-11039
Development and evaluation of an experimental parametric acoustic receiving array [PARRAY]
[AD-A072307] N80-11873
Electronics research at the University of Texas at Austin
[AD-A072436] N80-11987
TEXAS UNIV. AT EL PASO.
On the determination of arrival times for sound ranging. 1: Effects of finite amplitude propagation, vertical meteorological gradients, and system transient response
[AD-A072600] N80-11874
TEXTILE RESEARCH INST., PRINCETON, N. J.
Studies of dust cake formation and structure in fabric filtration: Second year
[PB-297581/1] N80-11650
TOLEDO UNIV., OHIO.
Scientific returns from a program of space missions to comets
N80-11977
TORONTO UNIV., DOWNSVIEW [ONTARIO].
Flow behind curved shock waves
[UTIAS-217] N80-11374
Linear state feedback control of rigid-link manipulators
[UTIAS-TN-214] N80-11779
TOULOUSE UNIV. [FRANCE].
Detonation of explosives using semiconducting layers
[PUBL-368] N80-11252
Electrical properties of solid insulators as a function of temperature and pressure
[PUBL-364] N80-11364
TRANSPORT AND ROAD RESEARCH LAB., CROWTHORNE [ENGLAND].
Directions to improve urban travel demand forecasting: Conference summary and white papers
[PB-297409/5] N80-11959
TRANSPORTATION AND ECONOMIC RESEARCH ASSOCIATES, INC., ARLINGTON, VA.
Disaggregating PIES fuel forecasts, validating PIES transportation model data base, and other technical services
[TID-29000] N80-11612
TRANSPORTATION RESEARCH BOARD, WASHINGTON, D. C.
Analysis of pavement systems
[PB-298098/5] N80-11268
Geometrics, hydraulics, and hydrology
[PB-298102/5] N80-11269
TRITEC, INC., COLUMBIA, MD.
Development of critical fluidic components
[AD-A071650] N80-11379
TRW DEFENSE AND SPACE SYSTEMS GROUP, REDONDO BEACH, CALIF.
Specific spacecraft evaluation: Special report
[NASA-CR-159420] N80-11137
Nonisenthalpic interaction of a planar premixed laminar flame with a parallel end wall
[AD-A071858] N80-11160
Advanced laser concepts. Addendum: Production of excited states
[AD-A071393] N80-11436
Fiber optic detection of low frequency underwater sound
[AD-A072829] N80-11898
Connections between comets and plasmas in space
N80-11974
TRW ENVIRONMENTAL SERVICES, VIENNA, VA.
Summary report on motor vehicle emissions inspection and maintenance programs for non-attainment areas in Louisiana
[PB-294979/0] N80-11648
TRW, INC., MCLEAN, VA.
International coal technology summary document
[DOE/PE-0010] N80-11621
TRW, INC., REDONDO BEACH, CALIF.
Solar power satellite system definition study
[NASA-CR-160368] N80-11123

U

UNDERGROUND SYSTEMS, INC., ARMONK, N. Y.
Preliminary dielectric studies. Spir-o-line cable for application at power frequencies
[HCP/T5054-01] N80-11351
UNILEVER RESEARCH, VLAARDINGEN [NETHERLANDS].
Rheology of concentrated suspensions
N80-11178
UNION CARBIDE CORP., TONAWANDA, N.Y.
Economic of hydrogen production and liquefaction updated to 1980
[NASA-CR-159163] N80-11238
UNITED TECHNOLOGIES CORP., SUNNYVALE, CALIF.
The 84-inch propellant grains
[AD-A071961] N80-11240
UNITED TECHNOLOGIES RESEARCH CENTER, EAST HARTFORD, CONN.
A comparison of the pitching and plunging response of an oscillating airfoil
[NASA-CR-3172] N80-11030
Noise of a model helicopter rotor due to ingestion of turbulence
[NASA-CR-3213] N80-11067
Argon/UF6 plasma exhaust gas reconstitution experiments using preheated fluorine and on-line diagnostics
[NASA-CR-159158] N80-11906
UNIVERSITY OF SOUTHERN CALIFORNIA, LOS ANGELES.
Waveguide studies for fiber optic sources
[AD-A071446] N80-11897
UNIVERSITY OF SOUTHERN CALIFORNIA, MARINA DEL REY.
An experiment in distributed interpretation
[AD-A072558] N80-11792
UNIVERSITY OF WEST FLORIDA, PENSACOLA.
A combined TLD/emulsion method of sampling dosimetry applied to Apollo missions
[NASA-CR-160367] N80-11985
UPPSALA UNIV. [SWEDEN].
On the influence of nickle on toughness and ductile-brittle transition in low-carbon lath martensite steels
[UPTEC-78-53-R] N80-11223
Desorption heat capacity of 3He adsorbed on solid argon
[UPTEC-78-16-R] N80-11264
Desorption heat capacity of 4He adsorbed on solid neon
[UPTEC-78-17-R] N80-11265
Description of experimental techniques used in heat capacity measurements of adsorbed helium
[UPTEC-78-18-R] N80-11266
Heat capacity of submonolayers of 3He adsorbed on solid neon
[UPTEC-78-31-R] N80-11267
Some methods for identification of linear systems with noisy input output data
[UPTEC-78-73-R] N80-11315
A method for temperature stabilization of current generators and zenerdiodes
[UPTEC-78-76-R] N80-11366
Metallic wear particles: A short review
[UPTEC-78-11-R] N80-11480
Studies of abrasive wear in a modified impact testing machine
[UPTEC-78-79-R] N80-11481
Comparison of some instrumental variable methods: Consistency and accuracy aspects
[UPTEC-78-88-R] N80-11499
An interactive framework for design automation
[UPTEC-78-47-R] N80-11821
On the achievable accuracy in stochastic control
[UPTEC-78-23-R] N80-11834
On the existence and stability of trapped Langmuir modes in a double layer
[UPTEC-78-89-R] N80-11918
Activities of the Department of Solid State Physics
[UPTEC-78-08-R] N80-11931
URBAN INST., WASHINGTON, D.C.
Directions to improve urban travel demand forecasting: Conference summary and white papers
[PB-297409/5] N80-11959
UTAH STATE UNIV., LOGAN.
Elimination of the effect of surface microtopography in an improved soil skin moisture determinator
[AD-A072614] N80-11680
Studies of atmospheric infrared emissions
[AD-A072831] N80-11689

V

VERLAG STAHLEISEN M.B.H., DUESSELDORF [WEST GERMANY].
Behaviour of steel under cyclic loading
[ICAF-1090] N80-11503
VERSAR, INC., SPRINGFIELD, VA.
Sampling and analysis of the aquatic environment in POTW's and their vicinity
[PB-297606/6] N80-11963
VIRGINIA POLYTECHNIC INST. AND STATE UNIV., BLACKSBURG.
Raster-scan display photometric noise measurement
[AD-A073024] N80-11308
Spatio-temporal intergration in the visual system
[AD-A069558] N80-11780
VIRGINIA UNIV., CHARLOTTESVILLE.
Experimental feasibility study of the application of magnetic suspension techniques to large-scale aerodynamic test facilities
[NASA-CR-146761] N80-11102
VON KARMAN INST. FOR FLUID DYNAMICS, RHODE-SAINT-GENESE [BELGIUM].
The measurement of film cooling effectiveness in short duration wind tunnels
[VKI-TN-127] N80-11108
Kinetic heating of high speed missiles
[PREPRINT-1975-5] N80-11128
The effect of pressure gradient and external turbulence on heat transfer to a cold flat plate
[VKI-TN-128] N80-11396
A method for the measurement of mixing properties in a turbulent jet flow
[VKI-TN-130] N80-11398
One dimensional design of centrifugal compressors taking into account flow separation in the impeller
[VKI-TN-129] N80-11486

W

WASHINGTON UNIV., SEATTLE.
Study in remote sensing for land use
[AD-A071802] N80-11537
Airborne measurements of cloud forming nuclei and aerosol particles at Kennedy Space Center, Florida
[NASA-CR-160359] N80-11716
Intelligence as an information processing concept
[AD-A069953] N80-11775
High temperature gas energy transfer
[AD-A072727] N80-11884
WATKINS-JOHNSON CO., PALO ALTO, CALIF.
High average power broadband electron-bombarded semiconductor EBS amplifier
[AD-A072533] N80-11331
WEATHER WING [3RD], OFFUTT AFB, NEBR.
Major midwest snowstorms
[AD-A072746] N80-11723
WEGMAN CO., INC., BUFFALO, N. Y.
Methane recovery from sanitary landfills; gas recovery system installation and testing
[PB-296622/4] N80-11254
WEST VIRGINIA UNIV., MORGANTOWN.
Effect of vertical scale distortion on the temperature field of a thermal-hydraulic model
[PB-297274/3] N80-11551

WESTINGHOUSE DEFENSE AND ELECTRONIC SYSTEMS CENTER, BALTIMORE, MD.
Architecture for higher level digital image processing
[AD-A071599] N80-11832
MNOS boram manufacturing methods and technology project
[AD-A071413] N80-11922

WESTINGHOUSE ELECTRIC CORP., PITTSBURGH, PA.
A phenomenological mechanism for the occurrence of the extrusion central burst defe
[AD-A072476] N80-11197

WIGGINS [J. H.] CO., REDONDO BEACH, CALIF.
Seismic safety margins research program. Phase I, project 7: Systems analysis specifications of computational approach
[UCRL-13986-1] N80-11699

WILLIAMS [O. G.] AND SKAGGS [R. L.], LAS VEGAS, NEV.
Solar parabolic trough forming process
[ALO-4158-1] N80-11626

WORLD METEOROLOGICAL ORGANIZATION, GENEVA [SWITZERLAND].
Meteorology and the human environment
[WMO-577] N80-11643
Implementation plan for the determination of the atmospheric contribution of petroleum hydrocarbons to the oceans.
[WMO-504] N80-11644
The atmosphere boundary layer
[WMO-523] N80-11707
First session of the WAMEX scientific and management regional committee
[GARP-SPEC-REPT-31] N80-11731
World Weather Watch: Consolidated report on the Voluntary Assistance Programme including projects approved for circulation in 1978
[WMO-525] N80-11732

YALE UNIV., NEW HAVEN, CONN.
Report of activities on world meteorological research, applications and water resources development
[WMO-529] N80-11733
Report of the fifteenth session of the Joint Organizing Committee
N80-11734

Y

YALE UNIV., NEW HAVEN, CONN.
Scheduling parallel processes without a common scheduler
[AD-A072158] N80-11814

CONTRACT NUMBER INDEX

Typical Contract Number Index Listing

Listings in this index are arranged alphanumerically by contract number. Under each contract number, the NASA accession numbers denoting documents that have been produced as a result of research done under that contract are arranged in ascending order. The NASA accession number denotes the number by which the citation is identified.

REPORT/ACCESSION NUMBER INDEX

Typical Report/Accession Number Index Listing

Listings in this index are arranged alphanumerically by report number. The NASA accession number denotes the number by which the citation is identified. An asterisk (*) indicates that the item is a NASA report. A pound sign (#) indicates that the item is available on microfiche.

PUBLIC COLLECTIONS OF NASA DOCUMENTS

DOMESTIC

NASA distributes its technical documents and bibliographic tools to eleven special libraries located in the organizations listed below. Each library is prepared to furnish the public such services as reference assistance, interlibrary loans, photocopy service, and assistance in obtaining copies of NASA documents for retention.

CALIFORNIA
University of California, Berkeley

COLORADO
University of Colorado, Boulder

An extensive collection of NASA and NASA-sponsored documents and aerospace publications available to the public for reference purposes is maintained by the American Institute of Aeronautics and Astronautics, Technical Information Service, 555 West 57th Street, 12th Floor, New York, New York 10019.

EUROPEAN

An extensive collection of NASA and NASA-sponsored publications is maintained by the British Library Lending Division, Boston Spa, Wetherby, Yorkshire, England. By virtue of arrangements other than with NASA, the British Library Lending Division also has available many of the non-NASA publications cited in *STAR*. European requesters may purchase facsimile copy of microfiche of NASA and NASA-sponsored documents, those identified by both the symbols "#" and "*", from: ESA - Information Retrieval Service, European Space Agency, 8-10 rue Mario-Nikis, 75738 Paris CEDEX 15, France.

NAS 1.9/4.

WHAT YOU CAN DO FOR *STAR*

All users of this abstract service are urged to forward reports to be considered for announcement in *STAR*. This will aid NASA in its efforts to provide the fullest possible coverage of all scientific and technical publications that might support aeronautics and space research and development. If you have prepared relevant reports (other than those that you will transmit to NASA, DoD, or DOE through the usual contract- or grant-reporting channels), please send them for consideration to the NASA Scientific and Technical Information Facility, P. O. Box 8757, B. W. I. Airport, Maryland 21240.

Reprints of journal articles, book chapters, and conference papers are also welcome. These will be considered for announcement in *STAR's* companion journal, *International Aerospace Abstracts*.

You may specify a particular source to be included in a report announcement if you wish; otherwise the report will be placed on public sale at the National Technical Information Service. Copyrighted publications will be announced but not distributed or sold.

PURCHASE OF *STAR*

The semimonthly issues and the cumulative index issues are available postpaid on subscription and in single copy from the Superintendent of Documents, United States Government Printing Office, Washington, D.C., 20402, United States of America.

Semimonthly issues...

Annual subscription rates: $60.00 domestic; $75.00 foreign. Price per single copy: $2.50 domestic; $3.15 foreign.

Cumulative index issues, semiannual and annual...

Annual subscription rates for both: $25.00 domestic; $31.25 foreign. Price per single copy: semiannual $9.50 domestic, $11.90 foreign; annual $16.00 domestic, $20.00 foreign.

Domestic subscription rates...

Apply to the United States, Canada, Mexico, and all Central and South American countries, except as noted below.

Foreign subscription rates...

Apply to Argentina, Brazil, French Guiana, Guyana, Surinam, Belize, and all other countries throughout the world.

Payment should be by check, money order, or document coupons, and must accompany order. Remittances from foreign countries should be made by international money order or draft on an American bank, payable to the Superintendent of Documents, or by UNESCO book coupons.

PUBLISHED BY:

UNITED STATES GOVERNMENT
NATIONAL AERONAUTICS AND SPACE ADMINISTRATION
SCIENTIFIC AND TECHNICAL INFORMATION BRANCH

Scientific and Technical Aerospace Reports, Volume 18, is prepared by the NASA Scientific and Technical Information Facility operated for the National Aeronautics and Space Administration by Informatics Information Systems Company.

The Administrator of the National Aeronautics and Space Administration has determined that the publication of this periodical is necessary in the transaction of the public business required by law of this Agency. Use of funds for printing this periodical has been approved by the Director of the Office of Management and Budget through June 30, 1981.

US ISSN 0036-8741

INTRODUCTION

Scientific and Technical Aerospace Reports (STAR) is a major component of a comprehensive National Aeronautics and Space Administration information system covering aeronautics, space, and supporting disciplines. *STAR* is issued on the 8th and 23rd of each month and announces current publications of the following types:

- NASA, NASA contractor, and NASA grantee reports
- Reports issued by other U.S. Government agencies, domestic and foreign institutions, universities, and private firms
- Translations in report form
- NASA-owned patents and patent applications
- Dissertations and theses

Cumulative index volumes are published semiannually and annually.

Journal, book, and conference literature, cover-to-cover journal translations, and certain foreign dissertations are announced in a companion journal, *International Aerospace Abstracts (IAA)*, available on subscription from the American Institute of Aeronautics and Astronautics, Technical Information Service, 555 West 57th Street, 12th Floor, New York, New York 10019.

ON-GOING RESEARCH PROJECTS

By arrangement between NASA and the Smithsonian Science Information Exchange (SSIE), a separate section of information on aerospace-related *On-Going Research Projects* is inserted into each issue of *STAR*. The insert presents titles of active NASA grants and university contracts, summary portions of recently updated *NASA Research and Technology Objectives and Plans (RTOPs)*, and notices of non-NASA research projects that were funded in the most recent or current fiscal year. The latter are selected by SSIE. The project announcements in the insert are arranged by *STAR* divisions but are otherwise entirely separate from *STAR*. They are not indexed nor machine-searchable by NASA. Current and retrospective searches are available from SSIE, 1730 M Street, N.W., Washington, D.C. 20036.

SUBJECT SCOPE

Subject scope of *STAR*, *IAA*, and *On-Going Research Projects* includes all aspects of aeronautics and space research and development, supporting basic and applied research, and applications. Aerospace aspects of earth resources, energy development, conservation, oceanography, environmental protection, urban transportation, and other topics of high national priority are also covered.

OTHER NASA PUBLICATIONS

Other NASA publications and information services are described in the publication, *The NASA Scientific and Technical Information System ... and How to Use It*, available without charge from the NASA Scientific and Technical Information Facility, P. O. Box 8757, B. W. I. Airport, Maryland 21240.

HOW TO USE STAR SUBJECT CATEGORIES

STAR is categorized by 10 major subject divisions divided into 74 specific subject categories and one general category/division. The major subject divisions are listed in the Table of Contents, together with a note for each that defines its scope and provides any cross-references. For example:

AERONAUTICS

Includes aeronautics (general); aerodynamics; air transportation and safety; aircraft communications and navigation; aircraft design, testing and performance; aircraft instrumentation; aircraft propulsion and power; aircraft stability and control; and research and support facilities (air).

For related information see also *Astronautics*.

Each major division is further divided into as many as nine specific categories, which are identified by category numbers.

Abstracts in *STAR* are grouped by specific category, the categories appearing in sequential order. Category breaks in the abstract section are identified by the category number and title, and a scope note. Cross-references to other categories are provided as appropriate. For example:

02 AERODYNAMICS

Includes aerodynamics of bodies, combinations, wings, rotors, and control surfaces; and internal flow in ducts and turbomachinery.

For related information see also *34 Fluid Mechanics and Heat Transfer*.

CROSS-REFERENCES

Individual *STAR* abstracts are not ordinarily cross-referenced, except for certain conference reports or book translations that have had separate abstracts written for their component papers or chapters. Citations and abstracts of the components follow immediately after those of the parent document. When the subject content of a component differs sufficiently from the general content of the parent, a cross-reference citation also is printed at the end of the category to which it normally would have been assigned if it were independent.

DOCUMENTS ON MICROFICHE

Documents on microfiche[1] are designated by a pound sign (#) following the accession number. The pound sign is used without regard to the source or quality of the microfiche.

AVAILABILITIES

One or more sources from which a document announced in *STAR* is available to the public is given in each citation. The most commonly indicated sources and their acronyms or abbreviations are listed below. If the publication is available from a source other than those listed, the publisher and his address will be displayed on the availability line or in combination with the corporate source line.

(1) A microfiche is a transparent sheet of film, 105 by 148 mm in size, containing as many as 60 to 98 pages of information reduced to micro images (not to exceed 26:1 reduction).

Avail: NTIS. Sold by the National Technical Information Service. Prices for hard copy (HC) and microfiche (MF) are indicated by a price code following the letters HC or MF in the *STAR* citation. Current values for the price codes are given in the tables on page vii.

Initially distributed microfiche under the NTIS SRIM (Selected Research in Microfiche) is available at greatly reduced unit prices. For this service and for information concerning subscription to NASA printed reports, consult the NTIS Subscription Section, Springfield, Va. 22161.

NOTE ON ORDERING DOCUMENTS: When ordering NASA publications (those followed by the * symbol), use the N accession number. NASA patent applications (only the specifications are offered) should be ordered by the US-Patent-Appl-SN number. Non-NASA publications (no asterisk) should be ordered by the AD, PB, or other *report* number shown on the last line of the citation, not by the N accession number. It is also advisable to cite the title and other bibliographic identification.

Avail: SOD (or GPO). Sold by the Superintendent of Documents, U.S. Government Printing Office, in hard copy. The current price and order number are given following the availability line. (NTIS will fill microfiche requests, at the standard $3.00 price, for those documents identified by a # symbol.)

Avail: NASA Public Document Rooms. Documents so indicated may be examined at or purchased from the National Aeronautics and Space Administration, Public Documents Room (Room 126), 600 Independence Ave., S.W., Washington, D.C. 20546, or public document rooms located at each of the NASA research centers, the NASA Space Technology Laboratories, and the NASA Pasadena Office at the Jet Propulsion Laboratory.

Avail: DOE Depository Libraries. Organizations in U.S. cities and abroad that maintain collections of Department of Energy reports, usually in microfiche form, are listed in *Energy Research Abstracts*. Services available from the DOE and its depositories are described in a booklet, *DOE Technical Information Center - Its Functions and Services* (TID-4660), which may be obtained without charge from the DOE Technical Information Center.

Avail: Univ. Microfilms. Documents so indicated are dissertations selected from *Dissertation Abstracts* and are sold by University Microfilms as xerographic copy (HC) and microfilm. All requests should cite the author and the Order Number as they appear in the citation.

Avail: USGS. Originals of many reports from the U.S. Geological Survey, which may contain color illustrations, or otherwise may not have the quality of illustrations preserved in the microfiche or facsimile reproduction, may be examined by the public at the libraries of the USGS field offices whose addresses are listed in this Introduction. The libraries may be queried concerning the availability of specific documents and the possible utilization of local copying services, such as color reproduction.

Avail: HMSO. Publications of Her Majesty's Stationery Office are sold in the U.S. by Pendragon House, Inc. (PHI), Redwood City, California. The U.S. price (including a service and mailing charge) is given, or a conversion table may be obtained from PHI.

Avail: BLL (formerly NLL): British Library Lending Division, Boston Spa, Wetherby, Yorkshire, England. Photocopies available from this organization at the price shown. (If none is given, inquiry should be addressed to the BLL.)

Avail: Fachinformationszentrum, Karlsruhe. Sold by the Fachinformationszentrum Energie, Physik, Mathematik GMBH, Eggenstein Leopoldshafen, Federal Republic of Germany, at the price shown in deutschmarks (DM).

Avail: Issuing Activity, or Corporate Author, or no indication of availability. Inquiries as to the availability of these documents should be addressed to the organization shown in the citation as the corporate author of the document.

Avail: U.S. Patent and Trademark Office. Sold by Commissioner of Patents and Trademarks, U.S. Patent and Trademark Office, at the standard price of 50 cents each, postage free. (See discussion of patents and patent applications below.)

NASA PATENTS AND PATENT APPLICATIONS

Patents and patent applications owned by NASA are announced in *STAR* under appropriate subject categories and are referenced in the *STAR* indexes. In the Report/Accession Number Index, patents are indexed by the NASA Case Number (which appears in lieu of the report number in other indexes), the U.S. Patent Number, the U.S. Patent Application Serial Number, and the U.S. Patent Class. Patent applications for which patents have not yet been issued are indexed by the NASA Case Number and the U.S. Patent Application Serial Number.

NASA *patent application specifications* are sold in paper copy by the National Technical Information Service at price code A02 ($4.00 domestic, $8.00 foreign). Microfiche are sold at price code A01 ($3.00 domestic; $4.50 foreign). The US-Patent-Appl-SN- number should be used in ordering either paper copy or microfiche from NTIS. Printed copies of *patents* (which are not microfiched) are available for purchase at 50 cents per copy from:

Commissioner of Patents and Trademarks
U.S. Patent and Trademark Office
Washington, D.C. 20231

When ordering patents, the U.S. Patent Number should be used, and payment must be remitted in advance, preferably by money order or check payable to the Commissioner of Patents and Trademarks. Prepaid purchase coupons for ordering are also available from the Patent and Trademark Office. The patents and patent applications announced in *STAR* are owned by NASA and are available for royalty-free licensing. Requests for licensing terms and further information should be addressed to:

Assistant General Counsel for Patent Matters/Code GP-1
National Aeronautics and Space Administration
Washington, D.C. 20546

ELIGIBILITY AND REGISTRATION FOR NASA INFORMATION PRODUCTS AND SERVICES

A variety of services, in addition to the distribution of NASA scientific and technical reports and of *STAR* and its cumulative indexes, is available to organizations of the following types that have registered with NASA to receive specific services or products:

1. NASA offices, research centers, contractors, subcontractors, grantees, and consultants;

2. Other U.S. Government agencies and their contractors;
3. Libraries in the United States that have arrangements with NASA to maintain collections of NASA documents for public reference;
4. Other organizations in the United States having a need for NASA documents in work related to aeronautics and space research;
5. Organizations abroad that have established reciprocal document exchange arrangements with NASA.

Only the central service points or central points of document acquisition and control within qualified organizations are eligible to register for NASA products and services. Domestic organizations that may be eligible to receive various classes of NASA publications and services should address their requests for registration or for further information to:

NASA Scientific and Technical Information Facility
Attn.: Registration Activity
P.O. Box 8757
B.W.I. Airport, Maryland 21240

Organizations abroad should direct requests to the same address, but to the attention of: International Exchange Program.

AVAILABILITY OF STAR ABSTRACTS ON MICROFICHE

Microfiche of the abstract sections of this issue ahd other issues of *STAR* are available on annual subscription from NTIS, Attn: Subscriptions, 5285 Port Royal Road, Springfield, Virginia 22161. Annual subscription rates are $45.00 North America; $90.00 foreign. Abstract sections for previous years retroactive to 1964 are available at the current rates. Microfiche for individual *STAR* issue abstract sections are not available.

VOLUME 18 NUMBER 3/FEBRUARY 8, 1980

TABLE OF CONTENTS

AERONAUTICS

Includes aeronautics (general); aerodynamics; air transportation and safety; aircraft communications and navigation; aircraft design, testing and performance; aircraft instrumentation; aircraft propulsion and power; aircraft stability and control; and research and support facilities (air).

For related information see also *Astronautics*.

01 AERONAUTICS (GENERAL) 275

02 AERODYNAMICS 282

Includes aerodynamics of bodies, combinations, wings, rotors, and control surfaces; and internal flow in ducts and turbomachinery.

For related information see also *34 Fluid Mechanics and Heat Transfer*.

03 AIR TRANSPORTATION AND SAFETY 287

Includes passenger and cargo air transport operations; and aircraft accidents.

For related information see also *16 Space Transportation* and *85 Urban Technology and Transportation*.

04 AIRCRAFT COMMUNICATIONS AND NAVIGATION 288

Includes digital and voice communication with aircraft; air navigation systems (satellite and ground based); and air traffic control.

For related information see also *17 Spacecraft Communications, Command and Tracking* and *32 Communications*.

05 AIRCRAFT DESIGN, TESTING AND PERFORMANCE 288

Includes aircraft simulation technology.

For related information see also *18 Spacecraft Design, Testing and Performance* and *39 Structural Mechanics*.

06 AIRCRAFT INSTRUMENTATION N.A.

Includes cockpit and cabin display devices; and flight instruments.

For related information see also *19 Spacecraft Instrumentation* and *35 Instrumentation and Photography*.

07 AIRCRAFT PROPULSION AND POWER 290

Includes prime propulsion systems and systems components, e.g., gas turbine engines and compressors; and on-board auxiliary power plants for aircraft.

For related information see also *20 Spacecraft Propulsion and Power, 28 Propellants and Fuels*, and *44 Energy Production and Conversion*.

08 AIRCRAFT STABILITY AND CONTROL 291

Includes aircraft handling qualities; piloting; flight controls; and autopilots.

09 RESEARCH AND SUPPORT FACILITIES (AIR) 292

Includes airports, hangars and runways; aircraft repair and overhaul facilities; wind tunnels; shock tube facilities; and engine test blocks.

For related information see also *14 Ground Support Systems and Facilities (Space)*.

ASTRONAUTICS

Includes astronautics (general); astrodynamics; ground support systems and facilities (space); launch vehicles and space vehicles; space transportation; spacecraft communications, command and tracking; spacecraft design, testing and performance; spacecraft instrumentation; and spacecraft propulsion and power.

For related information see also *Aeronautics*.

12 ASTRONAUTICS (GENERAL) N.A.

For extraterrestrial exploration see *91 Lunar and Planetary Exploration*.

13 ASTRODYNAMICS 292

Includes powered and free-flight trajectories; and orbit and launching dynamics.

14 GROUND SUPPORT SYSTEMS AND FACILITIES (SPACE) N.A.

Includes launch complexes, research and production facilities; ground support equipment, e.g., mobile transporters; and simulators.

For related information see also *09 Research and Support Facilities (Air)*.

15 LAUNCH VEHICLES AND SPACE VEHICLES 293

Includes boosters; manned orbital laboratories; reusable vehicles; and space stations.

16 SPACE TRANSPORTATION N.A.

Includes passenger and cargo space transportation, e.g., shuttle operations; and rescue techniques.

For related information see also *03 Air Transportation and Safety* and *85 Urban Technology and Transportation*.

17 SPACECRAFT COMMUNICATIONS, COMMAND AND TRACKING N.A.

Includes telemetry; space communications networks; astronavigation; and radio blackout.

For related information see also *04 Aircraft Communications and Navigation* and *32 Communications*.

18 SPACECRAFT DESIGN, TESTING AND PERFORMANCE N.A.

Includes spacecraft thermal and environmental control; and attitude control.

For life support systems see *54 Man/System Technology and Life Support*. For related information see also *05 Aircraft Design, Testing and Performance* and *39 Structural Mechanics*.

19 SPACECRAFT INSTRUMENTATION **N.A.**

For related information see also *06 Aircraft Instrumentation* and *35 Instrumentation and Photography*.

20 SPACECRAFT PROPULSION AND POWER **294**

Includes main propulsion systems and components, e.g., rocket engines; and spacecraft auxiliary power sources.

For related information see also *07 Aircraft Propulsion and Power, 28 Propellants and Fuels,* and *44 Energy Production and Conversion*.

CHEMISTRY AND MATERIALS

Includes chemistry and materials (general); composite materials; inorganic and physical chemistry; metallic materials; nonmetallic materials; and propellants and fuels.

23 CHEMISTRY AND MATERIALS (GENERAL) **294**

Includes biochemistry and organic chemistry.

24 COMPOSITE MATERIALS **295**

Includes laminates.

25 INORGANIC AND PHYSICAL CHEMISTRY **296**

Includes chemical analysis, e.g., chromatography; combustion theory; electrochemistry; and photochemistry.

For related information see also *77 Thermodynamics and Statistical Physics*.

26 METALLIC MATERIALS **300**

Includes physical, chemical, and mechanical properties of metals, e.g., corrosion; and metallurgy.

27 NONMETALLIC MATERIALS **302**

Includes physical, chemical, and mechanical properties of plastics, elastomers, lubricants, polymers, textiles, adhesives, and ceramic materials.

28 PROPELLANTS AND FUELS **304**

Includes rocket propellants, igniters, and oxidizers; storage and handling; and aircraft fuels.

For related information see also *07 Aircraft Propulsion and Power, 20 Spacecraft Propulsion and Power,* and *44 Energy Production and Conversion*.

ENGINEERING

Includes engineering (general); communications; electronics and electrical engineering; fluid mechanics and heat transfer; instrumentation and photography; lasers and masers; mechanical engineering; quality assurance and reliability; and structural mechanics.

For related information see also *Physics*.

31 ENGINEERING (GENERAL) **307**

Includes vacuum technology; control engineering; display engineering; and cryogenics.

32 COMMUNICATIONS **313**

Includes land and global communications; communications theory; and optical communications.

For related information see also *04 Aircraft Communications and Navigation* and *17 Spacecraft Communications, Command and Tracking*.

33 ELECTRONICS AND ELECTRICAL ENGINEERING **318**

Includes test equipment and maintainability; components, e.g., tunnel diodes and transistors; microminiaturization; and integrated circuitry.

For related information see also *60 Computer Operations and Hardware* and *76 Solid-State Physics*.

34 FLUID MECHANICS AND HEAT TRANSFER **321**

Includes boundary layers; hydrodynamics; fluidics; mass transfer; and ablation cooling.

For related information see also *02 Aerodynamics* and *77 Thermodynamics and Statistical Physics*.

35 INSTRUMENTATION AND PHOTOGRAPHY **330**

Includes remote sensors; measuring instruments and gages; detectors; cameras and photographic supplies; and holography.

For aerial photography see *43 Earth Resources*. For related information see also *06 Aircraft Instrumentation* and *19 Spacecraft Instrumentation*.

36 LASERS AND MASERS **332**

Includes parametric amplifiers.

37 MECHANICAL ENGINEERING **334**

Includes auxiliary systems (non-power); machine elements and processes; and mechanical equipment.

38 QUALITY ASSURANCE AND RELIABILITY **335**

Includes product sampling procedures and techniques; and quality control.

39 STRUCTURAL MECHANICS **336**

Includes structural element design and weight analysis; fatigue; and thermal stress.

For applications see *05 Aircraft Design, Testing and Performance* and *18 Spacecraft Design, Testing and Performance*.

GEOSCIENCES

Includes geosciences (general); earth resources; energy production and conversion; environment pollution; geophysics; meteorology and climatology; and oceanography.

For related information see also *Space Sciences*.

42 GEOSCIENCES (GENERAL) **N.A.**

43 EARTH RESOURCES 340
Includes remote sensing of earth resources by aircraft and spacecraft; photogrammetry; and aerial photography.
For instrumentation see *35 Instrumentation and Photography*.

44 ENERGY PRODUCTION AND CONVERSION 352
Includes specific energy conversion systems, e.g., fuel cells and batteries; global sources of energy; fossil fuels; geophysical conversion; hydroelectric power; and wind power.
For related information see also *07 Aircraft Propulsion and Power, 20 Spacecraft Propulsion and Power, 28 Propellants and Fuels,* and *85 Urban Technology and Transportation*.

45 ENVIRONMENT POLLUTION 361
Includes air, noise, thermal and water pollution; environment monitoring; and contamination control.

46 GEOPHYSICS 364
Includes aeronomy; upper and lower atmosphere studies; ionospheric and magnetospheric physics; and geomagnetism.
For space radiation see *93 Space Radiation*.

47 METEOROLOGY AND CLIMATOLOGY 367
Includes weather forecasting and modification.

48 OCEANOGRAPHY 374
Includes biological, dynamic and physical oceanography; and marine resources.

LIFE SCIENCES

Includes life sciences (general); aerospace medicine; behavioral sciences; man/system technology and life support; and planetary biology.

51 LIFE SCIENCES (GENERAL) N.A.
Includes genetics.

52 AEROSPACE MEDICINE 375
Includes physiological factors; biological effects of radiation; and weightlessness.

53 BEHAVIORAL SCIENCES 376
Includes psychological factors; individual and group behavior; crew training and evaluation; and psychiatric research.

54 MAN/SYSTEM TECHNOLOGY AND LIFE SUPPORT 376
Includes human engineering; biotechnology; and space suits and protective clothing.

55 PLANETARY BIOLOGY N.A.
Includes exobiology; and extraterrestrial life.

MATHEMATICAL AND COMPUTER SCIENCES

Includes mathematical and computer sciences (general); computer operations and hardware; computer programming and software; computer systems; cybernetics; numerical analysis; statistics and probability; systems analysis; and theoretical mathematics.

59 MATHEMATICAL AND COMPUTER SCIENCES (GENERAL) 377

60 COMPUTER OPERATIONS AND HARDWARE 377

CSCL 01C ← COSATI CODE

The aspects of flight testing an aeroelastically tailored forward swept research wing on a BQM-34F drone vehicle are examined. The geometry of a forward swept wing, which is incorporated into the BQM-34F to maintain satisfactory flight performance, stability, and control is defined. A preliminary design of the aeroelastically tailored forward swept wing is presented.

1.0001, MINI-RPV (REMOTELY PILOTED VEHICLE) ENGINE DEMONSTRATOR PROGRAM

A.G. Bennett, Aerotech Co., *543 Auburn Dr., Auburn, Alabama* 36830 (DA0D4101; DAAJ02-77-C-0014)

Develop a lightweight multicylinder, two-stroke demonstrator engine to provide the technology base and source for future Army RPV engines for mini-RPV's. Address and solve the current engine problems of high vibration, high weight, high fuel consumption, short life and high cost.

Design, fabricate and test a 20 hp engine and deliver five engines o the government for evaluation. Design utilizes, to the maximum extent possible, high production rate components (cylinders, pistons, etc). Modify components as necessary to achieve program goals of 1.2 lb/hp, 0.8 lb/hp-hr sfc, 12,000 ft. altitude and 150 hour life.

SUPPORTED BY U.S. Dept. of Defense, Aviation Research & Development Command, Applied Technology Lab.

1.0002, SUPPLIES TO BE FURNISHED

G. Leffler, Signal Co. Inc., Airesearch Manufacturing, *402 S. 36th St., Phoenix, Arizona* 85034 (FA78NA-5050; FA161450 (TRAIS NO.))

The contractor is charged with furnishing and delivering the government a Gas Turbine Engine P/N372980-100, Model 085-91C, S/N P9563. This unit is to be overhauled and put in certified condition according to the specification of the manufacturer. It should also be certified as serviceable by the Federal Aviation Administration (FAA).

SUPPORTED BY U.S. Dept. of Transportation, Federal Aviation Admin.

1.0003, FLUIDIC FLEX VALVE FOR RAMJET FUEL CONTROL

D.J. Schaffer, Signal Co. Inc., Airesearch Mfg Co, *402 S. 36th St., Phoenix, Arizona* 85034 (DN881345; N62269-77-C-0352)

The basic objectives of this effort are to develop the analytical design criteria for flex duct valves for high fluid flow applications in general, and to conduct a practical demonstration on a flex duct valve for a 10,000 pound per hour range ramjet fuel control. This contract supports work unit ZA601, Agency Accession No. DN681080.

Analysis associated with a 500 pound per hour fuel metering valve indicated that the receiver rather than the nozzle should be the flexible member in the valve. This analysis will be reviewed again to determine the suitability of this approach for general application. In addition, the following parameters affecting valve design will be studied: duct aspect ratio, recovery nozzle design, flow forces, and leakage.

SUPPORTED BY U.S. Dept. of Defense, Naval Air Development Center, Aircraft & Crew Systems Tech Directorate

1.0004, INTERACTIVE COMPOSITE JOINT DESIGN

M.K. Smith, McDonnell Douglas Astronautics Co., *Long Beach, California* (DF136140; F33615-76-C-3058)

Working in an interactive mode with digital computers has been shown to drastically reduce elapsed time for iterative type solutions and reduce human errors. The design of composite joints is normally an interactive problem, where it is necessary to review geometrics, materials, and internal load and stresses of candidate designs to optimize design details. The objective of this program is to improve the design capability for joints and stress concentrations in composite aircraft structures by exploiting the interactive communication with digital computers. The most critical design problem in composite aircraft structures is that of the stress concentrations at joints and cutouts.

An in-depth investigation will be made of the use of interactive computer operation and computer graphics to facilitate the design of composite structures at stress concentrations. Double-lap, single-lap, scarf and stepped-lap bonded and bolted joints will be considered.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Flight Dynamics Lab.

1.0005, IN-HOUSE LABORATORY INDEPENDENT RESEARCH PROGRAM (ILIR) - ROTOR ACOUSTIC RESEARCH

I.C. Statler, U.S. National Aeronautics & Space Admin., Office of Aeronautics & Space Technology, Ames Research Center, *Moffett Field, California* 94035 (DA0C5003)

The objective is to make maximum utilization of the information inherent in the radiated aerodynamically generated noise signature of rotors obtained by the newly developed in-flight noise measurement technique. These measurements provide noise pressure signals undistorted by reverberation, Doppler shift and other normally prevalent signal distortion mechanisms. These research efforts should provide the understanding of the noise generation mechanisms necessary to develop relatively simple mathematical analysis which can be used for rotor noise source and radiation pattern prediction.

A combined experimental theoretical effort will be followed utilizing tools developed to separate the noise generation mechanisms and allow concentrated effort to solve the complex problems in a step-by-step fashion. The first effort will be to define the impulsive noise generation mechanism and provide theoretical prediction capability. The second phase will concentrate on the blade vortex interaction noise and determine influence of rotor blade geometric parameters on rotor noise. Model rotor experimental efforts will utilize the laser velocimeter and other techniques such as schlieren and shadowgraph to verify flow field disturbance patterns.

SUPPORTED BY U.S. Dept. of Defense, Aviation Systems Command, Ames Research Center

1.0006, STUDY FOR SYSTEM ANALYSIS TO DEVELOP FUTURE CIVIL AIRCRAFT NOISE REDUCTION ALTERNATIVES

Unknown, Wyle Lab., *123 Maryland St., El Segundo, California* 90245 (FA77WA-3990; FA160340 (TRAIS NO.))

The contractor shall develop civil aircraft classification specifications which consider the details of aircraft design, noise

characteristics and performance to provide separately identifiable classes for noise regulations. For administrative and regulatory practicability reasons, the key result of this shall be the identification of the minimum practical number of classes which meets all requirements.

SUPPORTED BY U.S. Dept. of Transportation, Federal Aviation Admin.

1.0007, THUNDERSTORM TURBULENCE HAZARD DETECTION AND DEPICTION FOR CONTROLLERS
Unknown, U.S. Dept. of the Interior, Bureau of Reclamation, *Bldg. 67, Denver Federal Center, Denver, Colorado* 80225 (FA77WAI-806; FA161235 (TRAIS NO.))

The acquisition of information on the location and severity of turbulence in severe convection storm situations is of vital importance to safety of flight and efficient management of the nation's airspace. Thunderstorm turbulence and gust front and low-level clear air wind shear detection and tracking have become feasible with the development of pulsed Doppler radar systems. The program requirements are for the development and testing of the detection, tracking and extrapolation of movement, and presentation of severe weather areas for use in the NAS.

SUPPORTED BY U.S. Dept. of Transportation, Federal Aviation Admin.

1.0008, ENGINE/AIRFRAME/DRIVE TRAIN DYNAMIC INTERFACE DOCUMENTATION
W.G. Flannelly, Kaman Aerospace Corp., *Old Windsor Rd., Bloomfield, Connecticut* 06002 (DA0E3772; DAAJ02-77-C-0039)

The coupled interaction between two or more helicopter dynamic subsystems has often been the source of vibration problems. This is particularly true when considering the helicopter as a dynamic system in which excitations can be generated by any or all of the propulsion system, the airframe or the drive system. The problems of vibration related interface compatibility in engine/drive system installations are usually complicated by the inherent coupling of the three (3) major multi-degree-of-freedom systems, i.e., engine, airframe and drive train. All background data and documentation of past experience lies in the hands of the airframe/engine industry, primarily the former. The technical objective of this contractual effort is to document industry experience to the degree required to permit plans/programs to be formulated as part of an overall government effort to accumulate data which will eventually lead to a solution of generic problems of this type.

Award sole source contracts to the major manufacturers of gas turbine powered US military helicopters, to review existing files, compile reports, memoranda, analytical design efforts, etc., and coordinate with appropriate engine manufacturers.

SUPPORTED BY U.S. Dept. of Defense, Aviation Research & Development Command, Research & Technology Lab.

1.0009, ADVANCED STRUCTURES CONCEPTS R&M/COST ASSESSMENTS
T.N. Cook, United Technologies Corp., Sikorsky Aircraft Division, *N. Main St., Stratford, Connecticut* 06602 (DA0E3788; DAAJ02-77-C-0061)

Establish R&M and life-cycle cost characteristics of advanced structures concepts as applied to Army helicopters.

(a) Perform a failure mode and effects analysis of existing advanced structures design concepts to evaluate the effectiveness of these concepts for minimizing Army aircraft structures field problems and repair costs. (b) Fabricate representative samples of the most promising structural design concepts and conduct laboratory testing to evaluate R&M characteristics. (c) Perform a maintenance evaluation of the most promising structural design concepts. (d) Prepare a R&M design considerations document. (e) Perform a cost analysis.

SUPPORTED BY U.S. Dept. of Defense, Aviation Research & Development Command, Research & Technology Lab.

1.0010, THREE-DIMENSIONAL TRANSONIC DATA ACQUISITION AND EVALUATION
B.L. Hinson, Lockheed Georgia Co., *86 S. Cobb Dr., Marietta, Georgia* 30060 (DF052310; F49620-78-C-0068)

AF function - advanced aerospace vehicles. Deficiency - a lack of reliable experimental data for isolated wings in transonic flow that is suitable for use in developing and evaluating computational methodologies. Objective - to obtain a set of high quality experimental data for isolated wings suitable for evaluating new and future theoretical subsonic and transonic aerodynamic methods, to determine the influence of simple fuselage simulations on the wing aerodynamics, and to evaluate the level of accuracy and computational efficiency of representative versions of the new three-dimensional transonic computer codes. How work contributes - the acquisition of a reliable set of transonic wing data will provide a means for comparison of the various new and developing three-dimensional transonic codes which can differ in problem formulation, grid arrangement, finite difference schemes, and solution algorithms. With the availability of a good data base, methods can be assessed. Ultimately, the active use of these computer codes in aircraft design will depend to a large degree on the confidence developed through comparisons with good quality data.

Two supercritical wings, one of high and one of low aspect ratio, designed to produce well-behaved flows, will be tested in a high Reynolds number wind tunnel incorporating tunnel wall, boundary layer removal allowing simulation of true isolated wing conditions. The half span wings will be tested with and without a fuselage representation for a range of Mach numbers and angles of attack at which no extensive shock or pressure gradient induced boundary layer separation occurs. Both surface pressure (approximately 160 pressure orifices in each wing) and force balance readings will be taken. Also, a set of computational results will be generated and comparisons made for these test wings using the Bailey-Ballhaus small disturbance code, the Jameson full potential equation code, and the Jameson finite volume code.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Office of Scientific Research

1.0011, OVERPRESSURE/GUST STRUCTURE RESPONSE
G.M. Campbell, Boeing Co., *Wichita, Kansas* (DF191400; F29601-75-A-1017)

The objective is to determine experimentally the effect of internal pressurization on the response of the KC-135A fuselage upper lobe frames and to correlate the resulting data with data obtained analytically using the AFWL NOVA-2 computer code.

A 10-foot long section of fuselage will be modified, instrumented and installed in the 19-foot diameter thunderpipe shock tube at Sandia Laboratories, Albuquerque, New Mexico. A typical upper lobe frame in the fuselage section will be analyzed using the AFWL NOVA-2 computer code to predict the response of the frame to various levels of blast overpressure for several levels of internal pressurization. Using these predicted levels of response as a guide, a series of tests will be conducted on the fuselage section in the shock tube, varying the levels of pressurization and blast overpressure parametrically. Results from these tests will provide an experimental data base for use in developing methods for generalized predictions for this type of structure. Specifically, pressure-time history test data will be used with the NOVA-2 code to correlate predicted and measured strains and displacements.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Weapons Lab.

1.0012, OBSERVER RESPONSE TO HELICOPTER TYPE NOISE BELOW 100 HZ
S. Fidell, Bolt Beranek & Newman Inc., *50 Moulton St., Cambridge, Massachusetts* 02138 (DA0E3840; DAAK51 78 C 0013)

Examine the low frequency helicopter noise region to determine the applicability of the critical bandwidth concept on detectability; investigate infrasonic cueing effects; and incorporate the results in an existing helicopter detection computer program.

Conduct subjective tests in the laboratory using noise masking and noise signal inputs. Primary emphasis will be on frequen-

cies below 100 Hz to determine detectability effects of rotor fundamental frequency and several harmonics. Mathematical modeling will be developed describing the results.

SUPPORTED BY U.S. Dept. of Defense, Aviation Research & Development Command, Applied Technology Lab.

1.0013, WAKE STUDIES RELATED TO WAVERIDER AERODYNAMIC SHAPES

M. Finston, Massachusetts Inst. of Technology, School of Engineering, Dept. of Aeronautics & Astronautics, *77 Massachusetts Ave., Cambridge, Massachusetts* 02139 (DF042900; F44620-76-C-0049)

AF function - advanced aerospace vehicles. Opportunity - obtain preliminary aerodynamic information about a possible new class of aerodynamically configured vehicles and reentry bodies. Objective - map the near wake pressure and temperature characteristics and obtain lift to drag data of aerodynamically configured shapes to enable designers and developers to predict possible uses for these new shapes. How work contributes - will provide basic aerodynamic data to enable flight vehicle designers to evaluate possible uses for these new shapes.

An experimental effort at Mach 4.3 and 6.3 is planned using the magnetic suspension of an aerodynamically configured pyramid shape to investigate the lift to drag and near wake characteristics and their dependence on Reynolds number. Prior year experiments indicated that magnetic suspension is the only viable suspension method; string or wire suspension methods produce an acceptable blockage and disturbance.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Office of Scientific Research

1.0014, DIGITAL FLIGHT CONTROL SYSTEM ADVANCED TECHNIQUES EVALUATION

D.G. Bailey, Honeywell Inc., *2600 Ridgeway Parkway N.E., Minneapolis, Minnesota* 55413 (DF140040; F33615-77-C-2070)

Advanced high performance aircraft will be dependent on sophisticated flight controls integrated with other avionics for mission success. Improved survivability of the flight controls against combat damage, equipment failure, and electrical hazards will be required. Advanced digital techniques have the potential for satisfying these requirements but lack the necessary flight test verification that flight control system quality and integrity will not be impacted. The objective of this effort is to flight test demonstrate the feasibility of refinements to multimode control laws, analytic redundancy, area multiplexing, and fiber optic data links. This effort will reduce the technical risk and increase the confidence that these advanced digital techniques do not compromise flight control system performance and safety. It will also demonstrate the improved target tracking achieved through software refinements.

Existing multimode control laws in YA-7D (67-14583) will be refined through software reprogramming to optimize flight path performance during turning maneuvers. Software coding will be developed for fault tolerance through analytical redundancy and tested on the aircraft. A dais type area multiplexing data bus per MIL-STD-1553 will be developed to be compatible with the existing dual HDC-301 computers and flight tested for suitability of performing the flight stabilization and control functions. An optically coupled data bus will be investigated by exchanging the twisted shielded pair transmission lines with a fiber optic cable including optical line drivers and receivers and flight tested. A test program will be conducted to evaluate the potential susceptibility of the multiplexed data bus flight control system to lightning induced voltages. Using the multiplexed data bus, an improved dynamic gun sight will be added to further investigate target tracking capabilities of the multimode control laws.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Flight Dynamics Lab.

1.0015, AIRCRAFT TRAFFIC LOADING ANALYSIS AND MODEL

W.J. Horn, U.S. Dept. of Defense, Army, Corps of Engineers, Waterways Experiment Station, *P.O. Box 631, Vicksburg, Mississippi* 39180 (DA0S8187)

To obtain aircraft traffic distribution and aircraft loading data essential to the development of the improved method of pavement design for both rigid and flexible pavements and to develop computer aids for considering traffic in pavement design.

The results of current studies associated with aircraft dynamic wheel loads, aircraft traffic distribution at civil airports, as well as earlier studies of aircraft traffic distribution at military airfields will be extended and supplemented if necessary to obtain the desired traffic distribution and loading information. Data in the form of aircraft type, load distribution, operational speeds, lateral traffic distribution, longitudinal traffic distribution and pavement temperatures will be obtained from these studies and supplied in a usable form to those elements having the responsibility of developing pavement design procedures.

SUPPORTED BY U.S. Dept. of Defense, Corps of Engineers, Waterways Experiment Station

1.0016, IMPROVED AIRCRAFT/EXTERNAL STORE FLUTTER PREDICTION

M.A. Ferman, McDonnell Douglas Astronautics Co., *E. 411 St., St. Louis, Missouri* 63166 (DF140420; F33615-77-C-3087)

This work unit supports the area of aircraft/external store flutter prediction. Establishing flight flutter safety for military aircraft carrying large numbers and different combinations of external stores is presently costly and time consuming. The objective of this effort is to reduce the time and cost for aircraft/external store flutter prediction. This reduction is expected to reduce the time and cost required for establishing flight flutter safety of military aircraft carrying external stores.

Add the capability to include empennage flexibilities in vibration and flutter analyses using the FACES (flutter of aircraft carrying external stores) computer program of AFFDL-TR-75-101. Also, provide program maintenance as required.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Flight Dynamics Lab.

1.0017, FEASIBILITY DEMONSTRATION OF A RAFT SYSTEM

D. Meisner, Air Cruisers Co., *P.O. Box 180, Belmar, New Jersey* 07719 (DN781462; N62269-76-C-0273)

Demonstrate the feasibility of a helicopter installed system designed to provide deceleration during free fall, and subsequent flotation, of a high value cargo that has been intentionally jettisoned or inadvertently dropped during vertical replenishment operations over water. Automatic deployment of the system is planned to prevent specified levels of damage to the cargo upon impact with the water, to avert sinking and to facilitate recovery by surface ship or helicopter. This contract supports work unit PH104, Agency Accession No. DN681034.

It is planned to conceive, analyze, and design a raft system including its method of attachment, which is capable of meeting the objectives specified in statement of work SOW 3041-21; to fabricate feasibility test hardware, and to support NavAirDevCen personnel in subsequent flight tests.

SUPPORTED BY U.S. Dept. of Defense, Naval Air Development Center, Aircraft & Crew Systems Tech Directorate

1.0018, DESIGN AND FABRICATION OF RAFT/H46 INTERFACE FITTINGS

D. Meisner, Air Cruisers Co., *P.O. Box 180, Belmar, New Jersey* 07719 (DN881487; N62269-78-M-2229)

The objective of this task is to design and fabricate the H46 helicopter attachment fittings required to interface with the raft system. The fittings are internal to the airframe and are required to structurally transmit the mass and aerodynamic forces to the aircraft frame. This contract supports work unit PH104, Agency Accession No. DN 681034.

The approach is to determine the location of the major aircraft frame stations immediately aft of the cargo hatch. Structural bulkheads will be added as required to insure adequate load capability. Fabrication of structural bridges between major frames may be necessary. Emergency release shear pins will be included in the design.

SUPPORTED BY U.S. Dept. of Defense, Naval Air Development Center, Aircraft & Crew Systems Tech Directorate

1.0019, TACTICAL LANDING SYSTEM GUIDANCE TECHNIQUES (TLSGT)
A. Ploski, U.S. Dept. of Defense, Army, Aviation Research & Development Command, Avionics Research & Development Activity, *Fort Monmouth, Red Bank, New Jersey* 07703 (DA0B3400)

To develop a tactical landing system (TLS) that has (a) high potential for providing satisfactory performance in the Army's severe tactical enviroment, and (b) sufficient versatility to permit determination of guidance system parameters necessary for safe helicopter instrument approaches under tactical operational conditions.

A flexible scanning beam landing system (A-SCAN) subsequently called TLS was developed which provides selectable glide slope angles, multiple localizers, variable horizontal and vertical course widths, optional DME, course softening, split or colocated siting, and altitude above touchdown. An in-house flight research program was conducted to evaluate scanning beam guidance techniques. This led to the initiation of the development of a lightweight (under 50 pounds) KU-band equipment to show contrasts among the microwave landing system, the marine remote area approach and landing system and the Army tactical landing system philosophies.

SUPPORTED BY U.S. Dept. of Defense, Aviation Research & Development Command, Avionics Research & Development Activity

1.0020, WEIGHT AND COST IMPACT OF DAMAGE TOLERANCE CRITERIA ON NAVY AIRCRAFT
P. Bell, Grumman Corp., *S. Oyster Bay Rd., Bethpage, New York* 11714 (DN881382; N62269-77-C-0174)

To make an analytical assessment of the weight and cost impact of damage tolerance criteria, specifically those of A.F. specification MIL A 83444, on a Navy fighter aircraft. This contract will support work unit ZA 601, 'Aircraft Technology', Agency Accession DN 681080.

The specification MIL A 83444, 'Airplane Damage Tolerance Requirements' will be analytically applied to the Navy F 14 aircraft. This aircraft was not designed to this specification so hypothetical redesign required to meet the specification can be quantitatively translated into weight and cost. The impact of this specification on the structural reliability, weight and cost of Navy aircraft can then be assessed.

SUPPORTED BY U.S. Dept. of Defense, Naval Air Development Center, Aircraft & Crew Systems Tech Directorate

1.0021, DISPERSED AND RECONFIGURABLE DIGITAL FLIGHT CONTROL SYSTEM STUDY
J. Boudreau, Grumman Corp., *S. Oyster Bay Rd., Bethpage, New York* 11714 (DF139720; F33615-77-C-3041)

This work unit supports advanced aerospace vehicles. The advantage gained by the work unit is the increased survivability of flight control systems due to hostile fire. The objective of the work is to develop strategies to increase aircraft survivability by dispersing and/or reconfiguring the flight control system. The development of these strategies should reduce the total number of components required to perform the flight control function, reduce the logistics cost in maintaining flight control systems, and significantly increase the survivability of military aircraft.

Analyze the dispersion of sensors about the airframe with appropriate structural filtering. Compare the use of multiple control surfaces to perform the flight control functions with the use of multiple actuators on single surfaces. Analyze the advantages of dispersing micro-processors about the airframe. Compare the use of a central processing computer with dispersed and non-dispersed micro-processors for synchronization, monitoring of failures, and size required. Develop reconfiguration strategies for detectable sensor failures, surface failures, and computer failures. Determine how to isolate where the failure occurred and what mode of reconfiguration to use, i.e., switch the bad unit out, switch to a redundant unit, approximate the function using other non-redundant units, or switch to a back-up mode.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Flight Dynamics Lab.

1.0022, PARALLEL COMPUTATION FOR DEVELOPING NONLINEAR CONTROL PROCEDURES
H. Kaufman, Rensselaer Polytechnic Inst., School of Engineering, Dept. of Systems Engineering, *110 8th St., Troy, New York* 12181 (DF140850; AFOSR-77-3418)

This work unit supports the enhancement of advanced aerospace vehicles. This work unit is developing techniques to allow the use of parallel processing elements for flight control laws. The objective of this work unit is to determine a parallel microprocessor computer system which will allow the on-line processing of non-linear equations. On-line non-linear computation would permit USAF aircraft to hand-tailor flight control laws which would improve their performance.

Using a Van der Pol system the control vector will be found using the variation of extremals method. The above algorithms will be modified so as to update the initial costate matrix by a parallel optimization procedure, and then by the parallel shooting algorithm. Using a representative high order flight control system, design and evaluate optimal controllers. Evaluate improvement in performance using nonlinear rather than linear equations of motion. Consider an adaptive system which is adjusted on-line.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Flight Dynamics Lab.

1.0023, ADVANCED FUEL DELIVERY SYSTEM
R. Anderson, General Electric Co., Aircraft Engine Group, *1 Jimson Rd., Cincinnati, Ohio* 45215 (DN889779; N00140-78-C-0059)

The overall objective is to design, develop and demonstrate a lightweight, compact, contaminant resistant, fuel delivery system for use on advanced augmented gas turbine engines. This contract will supplement developments reported under DN596806 and DN796803.

The contractor will obtain a fuel contaminant hardened vane pump/motor element to replace the gear-type element currently integrated into the unitized pump being developed and tested under contract N00140-75-C-0040. The element will be integrated into the unitized pump and will be bench tested to confirm satisfactory performance. Tests will then be run to confirm the capability of the pump to operate with unfiltered contaminated fuel.

SUPPORTED BY U.S. Dept. of Defense, Navy, Naval Air Propulsion Test Center

1.0024, H. E. PROJECTILE PROTECTION DESIGN CRITERIA VALIDATION
G.W. Ducker, U.S. Dept. of Defense, Air Force, Flight Dynamics Lab., *Wright Patterson A.F.B., Dayton, Ohio* 45433 (DF141800)

Most of the source material used in the development of the general specification and design guide of contract F33615-76-C-3006 is unverified or derivative information. This work unit will provide direct verification of the contents of these documents, or the basis for their revision. This will insure that the documents are both effective and sufficient for their intended use. The objective of this work unit is to evaluate the design guidance developed under this contract, validate the requirements and design procedures delineated in the documents and define any necessary modifications. The result of this work effort will be assurance that the standardization documents are adequate for procurement and design, and that the protection requirements are sufficient.

A test plan will be prepared which will reflect the requirements established in the system specification. Test specimens will be prepared in accordance with the design guide. Ballistic tests will be performed in the aircraft survivability research facility, with threats up to and including 57mm HE-T rounds. The results will be analyzed and appropriate modifications made, as necessary, to the specification and design guide developed under the referenced contract.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Flight Dynamics Lab.

1.0025, MULTI-MICROPROCESSOR CONTROL ELEMENTS

J.E. Houtz, U.S. Dept. of Defense, Air Force, Flight Dynamics Lab., *Wright Patterson A.F.B., Dayton, Ohio* 45433 (DF142560)

This program seeks to apply multiple microprocessors to aircraft digital flight control systems. State-of-the-art digital flight control systems are tailored to a general purpose digital computer architecture. This program will apply multiple microprocessors to mechanize a flight control system specifically tailored to flight control requirements. It is anticipated that this program will improve reliability of flight critical control systems and reduce control system hardware and software costs.

Evaluation modules will be breadboarded and candidate microprocessors and supporting hardware will be evaluated in the AFFDL/FGL development laboratory. A candidate microprocessor type will be selected as the basic unit for a flight control system design. Based upon the selected microprocessor type, a prototype modularized distributed microprocessor flight control system will be designed.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Flight Dynamics Lab.

1.0026, AIR-TO-AIR EFFECTIVENESS MODELING

R.A. Mercier, U.S. Dept. of Defense, Air Force, Flight Dynamics Lab., *Wright Patterson A.F.B., Dayton, Ohio* 45433 (DF141260)

Before substantial resources are invested in new technologies, there is the need to determine if the technology contributes to future Air Force capabilities. The Air Force has developed PACAM as air-to-air combat simulation model, to assess the utility of advanced fighter aircraft concepts. To date, this model has not been verified and has seen only limited use. The objectives of this effort are to verify PACAM and to use this model to evaluate the effectiveness of advanced fighter aircraft concepts.

This effort will be conducted in-house. AIMVAL-ACEVAL data gathered during Project Red Flag will be screened and reduced to provide baseline time histories for various air-to-air engagements. FXB will then run PACAM using the same starting conditions as the baseline cases. The results will be compared to identify required improvements in the model. All changes to the model will be coordinated with AFAL, ADTC/XR, and JTCG. After the model has been verified, it will be used to evaluate the effectiveness of advanced fighter aircraft concepts. Anticipated results from this portion of the effort include assessing design utility, identifying areas for improving the design, and identifying tactics development needs to effectively use these advanced concepts.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Flight Dynamics Lab.

1.0027, LAMINATED WING STRUCTURES

J.B. Monfort, U.S. Dept. of Defense, Air Force, Flight Dynamics Lab., *Wright Patterson A.F.B., Dayton, Ohio* 45433 (DF140090)

There is a continuing need to reduce costs and improve the structural efficiency of advanced military aircraft. Conventional design and construction techniques have been virtually pushed to their limits, with further improvements dependent almost entirely upon development of new alloys and material systems. The objective of this effort is to evaluate innovative design and fabrication techniques wherein additional system advantage can be achieved through laminating aluminum sheet by adhesive bonding to reduce acquisition and life cycle costs concurrently with weight savings and increased damage tolerance of primary airframe structure. The combination of economic and performance benefits realizable from improved airframes will provide the Air Force with a valuable tool for accomplishing the assigned mission with critical resources.

The Air Force Flight Dynamics Laboratory and the Air Force Materials Laboratory are jointly sponsoring contract F33615-75-C-5178 with General Dynamics/Fort Worth, MASIS Accession Number 678180, to design, fabricate and evaluate an adhesively bonded, laminated aluminum stub wing box based on the F-16 design criteria. As an integral part of this program three such wing boxes will be tested by the AFFDL, with non-destructive evaluation support from AFML, at Wright-Patterson AFB for static strength, fatigue and damage tolerance. All data and the wing boxes shall be returned to the contractor for analysis and inclusion of results in their final technical report.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Flight Dynamics Lab.

1.0028, CONTROL SYSTEM INDUCED AEROELASTIC INSTABILITIES

T.E. Noll, U.S. Dept. of Defense, Air Force, Flight Dynamics Lab., *Wright Patterson A.F.B., Dayton, Ohio* 45433 (DF134660)

Aircraft with active control systems can encounter instabilities which result from the interaction of the control system with the aeroelastic response if adequate control compensation is not provided. The objective of this effort is to substantiate analyses which account for the control system interaction. This effort will establish the confidence and reliability of AFFDL in-house analysis procedures. The ultimate payoff will be a reliable method for use in the design stage for predicting and preventing control induced aeroelastic instabilities thus reducing cost and increasing flight safety for a new aircraft.

Frequency and time domain computer programs developed under AFFDL contract F33615-73-C-3063 will be applied to an advanced fighter aircraft with an active control system to predict control induced aeroelastic instabilities. These analyses will involve the interaction of the structural response, the airloads, and the control system response. A final technical report will be prepared.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Flight Dynamics Lab.

1.0029, COMBINED ENVIRONMENTS RELIABILITY TEST

H.E. Reynolds, U.S. Dept. of Defense, Air Force, Flight Dynamics Lab., *Wright Patterson A.F.B., Dayton, Ohio* 45433 (DF136650)

Repair costs of Air Force aircraft electronics equipment attributable to environmentally induced failures have been found to be approximately 460 million dollars per year. Equipments typically fail in service six to eight times more often than expected from laboratory demonstrations. The objective of this effort is to develop a realistic but cost-effective combined environments test that could be used for both qualification and reliability test and evaluation. The use of this test in the development and acquisition of electronics equipment should significantly improve its field reliability and correlation between field and laboratory reliability.

Realistic assessment of and prediction of actual environmental conditions that equipment is subjected to in field service will be determined through acquisition and analysis of aircraft environmental data. Realistic combined environment profiles will be developed for evaluation and test of aircraft equipment for various classes of aircraft. Capability to 'fly the equipment in the laboratory' will be developed by combined environment testing under realistic temperature, airflow, humidity, altitude, and random vibration conditions representative of aircraft equipment installations. New testing standards will be generated to provide the tests required to increase the effectiveness of testing needed to assure that only reliable hardware is introduced into service.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Flight Dynamics Lab.

1.0030, DEFINE THE LOADING ENVIRONMENT OF AEROSPACE VEHICLES FOR THE DEVELOPMENT OF DESIGN CRITERIA

E.W. Turner, U.S. Dept. of Defense, Air Force, Flight Dynamics Lab., *Wright Patterson A.F.B., Dayton, Ohio* 45433 (DF131870)

One broad problem which the USAF must address is the design and fabrication of aerospace vehicles which have both high reliability and low life-cycle cost. Achieving these mutually conflicting goals requires a detailed knowledge of the loading environment to be used in developing valid design criteria, and advanced methods for computing the response of aerospace vehicles to this environment. The objective of this effort is to extend the present knowledge of the loading environment by acquiring and analyzing flight data, and developing techniques for computing the response of aerospace vehicles to the environment. This will lead to higher reliability and lower life cycle costs of aerospace vehicles.

A large collection of gust data is available from the previous critical atmospheric turbulence (CAT) recording programs. The aircraft structural integrity program (ASIP) is the primary source of operational flight loads data. Complementary data will be obtained from other recording programs conducted both by government agencies (including the AFFDL), and nongovernment agencies. The AFFDL recording programs will be conducted by installing special sensing and recording devices on both manned and unmanned flight vehicles, and flight simulators. Flight recorders will be developed when necessary to fulfill the future requirements of AFFDL recorder programs. Current data processing techniques will be used to reduce the data, and new techniques will be developed when existing techniques are inadequate. New methods will be investigated, and computer programs implemented to compute the response of aerospace vehicles to the gust and maneuver loading environment.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Flight Dynamics Lab.

1.0031, STRESS MEASUREMENT IN PARACHUTE CANOPIES UNDER BIAXIAL LOADING

H.G. Heinrich, University of Dayton, Graduate School, *300 College Park Ave., Dayton, Ohio* 45469 (DF142080; F33615-76-C-3145)

Current design practices for textile type canopies used in parachute recovery systems incorporate significant safety factors to account for the stresses resulting from dynamic loadings during the parachute opening process. As a result, parachute canopies are excessively heavy and bulky due to the required materials strength. The objective of this program is the development of a direct stress measurement technique for acquiring biaxial stress data on parachute canopies. The data acquired and engineering tool developed will contribute to the design of lighter and more reliable parachute recovery subsystems for AF weapons systems.

Model parachute canopies shall be instrumented with Omega stress transducers and the circumferential and radial stresses shall be measured during wind tunnel tests. Measured values shall be compared with the values calculated by existing parachute stress analyses.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Flight Dynamics Lab.

1.0032, A STUDY OF THE AERODYNAMIC INTERACTIONS OF THE TAIL ROTOR AND FIN 15710-E

P.F. Sheridan, Boeing Co., *P.O. Box 16858, Philadelphia, Pennsylvania* 19142 (DA0F9244; DAAG29-78-C-0021)

To conduct a study of wind tunnel model test data to gain an understanding of fin-tail rotor aerodynamic interactions, to identify the gaps in understanding the physical mechanisms at work, and to establish a basis for further analytical and test programs. Relevance -the investigation seeks to study and understand aerodynamic interactions between tail rotors and fins which have caused problems in vibration, performance and flying qualities and is therefore directly relevant to improving helicopter directional control techniques.

A study of all the relevant data acquired by Boeing-Vertol will be carried out and will include both fin and tail rotor forces and moments in both dimensional and non-dimensional forms. Flow visualization records will be examined in relation to the trends of the plotted data and correlative studies will be carried out.

SUPPORTED BY U.S. Dept. of Defense, Army Materiel Development & Readiness Command, Army Research Office

1.0033, DEVELOPMENT OF FLIGHT CONTROL SYSTEMS/FLYING QUALITIES CRITERIA FOR LIFT/CRUISE FAN V/STOL AIRCRAFT

C. Abrams, U.S. Dept. of Defense, Navy, Naval Air Development Center, Aircraft & Crew Systems Tech Directorate, *Warminster, Pennsylvania* 18974 (DN881124; N62269-77-C-0163)

To develop the criteria and specifications for an advanced flight propulsion control system and suitable pilot displays for a Navy multimission lift cruise fan aircraft. This effort is supported by work unit DH820B.

Investigations will be conducted to define flight control requirements for a lift cruise fan vehicle. Flying qualities criteria will be established for the design of a flight control display system suitable for all modes of flight including hover maneuvering, transition maneuvering, cruise maneuvering, take off and landing. The flight control development will address intergrated propulsive and aerodynamic control concepts, failure mode effects, pilot station controls and display actuation concepts and system reliability. The ability of the flight control display system to provide satisfactory flying qualities will be demonstrated through piloted simulation at the NASA Ames Research Center.

SUPPORTED BY U.S. Dept. of Defense, Navy, Naval Air Systems Command

1.0034, HEAVY-LIFT AIRSHIPS TECHNOLOGY SUPPORT

J.A. Eney, U.S. Dept. of Defense, Navy, Naval Air Development Center, Aircraft & Crew Systems Tech Directorate, *Warminster, Pennsylvania* 18974 (DN581478)

To explore and develop candidate heavy lift air vehicles pursuant to operational requirement OR 1019 SL.

Two vehicle concepts are under consideration, the 'rotor-balloon' with a rigid rotor affixed to an aerostat centerbody, and the 'quad-rotor' with four articulated rotors flanking an ellipsoidal hull. Both concepts are being carried through model testing and simulation phases. A preferred configuration, when determined, will be prototyped and flight tested.

SUPPORTED BY U.S. Dept. of Defense, Navy, Naval Air Systems Command

1.0035, NAVY STRUCTURAL FRACTURE CONTROL AND SERVICE LIFE MANAGEMENT PROGRAM

S.L. Huang, U.S. Dept. of Defense, Navy, Naval Air Development Center, Aircraft & Crew Systems Tech Directorate, *Warminster, Pennsylvania* 18974 (DN781434)

The objectives of this program are to augment the specifications for designing and accepting naval aircraft structures which will have a high degree of reliability and damage tolerance, and to formulate a new service life management system based on the existence of initial flaws and the technology for determining their rate of growth and the residual strength of structures in which they occur. Fracture mechanics concepts and NDI techniques will be used to quantify inherent and service induced damage and to evaluate their effect on structural behavior.

In order to achieve the stated objective of developing highly reliable fracture resistant air vehicle structures, new design and test specifications will be developed and implemented to insure structural integrity for current and future naval aircraft. A basic philosophical difference exists between this approach and the current procedure in that it is based upon the existence of initial flaws in the structure. The knowledge of the location, size and distribution of these flaws, inherent or induced during manufacture, is the starting point.

SUPPORTED BY U.S. Dept. of Defense, Navy, Naval Air Development Center

1.0036, ROTOR BLADE DYNAMIC RESPONSE AND BALLISTIC DAMAGE SURVIVABILITY
H. Zinberg, Bell Helicopter Co., *P.O. Box 482, Fort Worth, Texas* 76101 (DA0D4018; DAAJ02-75-C-0049)

To develop analytical techniques and modeling methods that will evaluate rotor blade survivability when subjected to ballistic damage in flight. The method shall be capable of evaluating composite and metal constructed main rotor blades for ballistic impacts up to and including 23mm HEI. The boundary conditions for structural stability and the flight regime necessary for 30 minutes safe flight after impact shall be established.

New computer programs will be generated or existing programs modified to account for reduced blade stiffness resulting from ballistic damage. Input data for programs will be blade section properties, location, impact energy and amount of material removed as a result of damage. Program will calculate blade residual strength, blade dynamic properties, and coupled rotor airframe dynamic properties. Static and dynamic tests will be performed on damaged blades and/or blade sections to verify analysis.

SUPPORTED BY U.S. Dept. of Defense, Aviation Research & Development Command, Applied Technology Lab.

1.0037, EXPERIMENTAL D-OPTIMAL DESIGN METHOD IN OPTIMAL AIRCRAFT DESIGN
J.A. Craig, General Dynamics Corp., *P.O. Box 748, Fort Worth, Texas* 76101 (DF141310; F33615-78-C-3011)

Computer aided aircraft designs are being increasingly applied for optimized aircraft designs. A significant problem area in computer aided aircraft designs is the selection of an optimal set of design vectors which are necessary for determining a quadratic regression for the aircraft performance parameters. A computer code for generating D-optimal designs, if accomplished, will exactly do the optimal screening of the design vectors, and the effectiveness, from the cost-savings point of view, of the D-optimal designs will be significant. Accuracy and reliability of the proposed work effort (i.e. computerizing the D-optimal design method) will enhance optimal aircraft designs for the Air Force missions.

The approach will be based on minimizing the variance of the response functions as well as by requiring that the variance of the coefficients of the quadratic regression be minimum too.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Flight Dynamics Lab.

1.0038, HT RM 78-17 - DEVELOPMENT OF ADVANCED STRUCTURES MAINTENANCE CONCEPTS
T.E. Condon, U.S. Dept. of Defense, Army, Aviation Research & Development Command, Applied Technology Lab., *Fort Eustis, Newport News, Virginia* 23604 (DA0E3814)

Development of maintenance concepts based on advanced structures concepts proposed or under development for application to Army helicopters of the 1980s.

Investigate and evaluate maintenance concepts applicable to advanced structures concepts. Additionally develop test and evaluation techniques applicable to the advanced structures concepts. An integral part of this program will be the development of field repair techniques and kits.

SUPPORTED BY U.S. Dept. of Defense, Aviation Research & Development Command, Research & Technology Lab.

1.0039, HT RM 78-20 - ENVIRONMENTAL DESIGN AND TEST GUIDE FOR ARMY HELICOPTERS
Unknown, U.S. Dept. of Defense, Army, Aviation Research & Development Command, Applied Technology Lab., *Fort Eustis, Newport News, Virginia* 23604 (DA0E3828)

The objective of this effort will be to develop an environmental design and test guide for Army helicopters based on the previous work performed by Rockwell International. The guide will be used to assist Army planners in the establishment of design and test criteria for future Army aircraft programs. This document will also be used by industry personnel to assist them in the design and test of their vehicles to meet environmental requirements.

Using the services of the Earth Sciences Laboratory, Fort Belvoir, VA, the combined and accelerated environmental design and test criteria and procedures will be developed where practical or a method developed to establish those criteria and procedures when it is not practical to establish generalized criteria and/or procedures. The previous work by Rockwell and this work will then be combined and a design and test guide prepared.

SUPPORTED BY U.S. Dept. of Defense, Aviation Research & Development Command, Research & Technology Lab.

1.0040, DYNAMIC RESPONSE OF COMPOSITE STRUCTURES TO NONNUCLEAR THREATS
J.G. Avery, Boeing Co., *7555 E. Marginal Way S., Seattle, Washington* 98124 (DF137670; F33615-78-C-3403)

With increased usage of advanced composites as structural materials in aircraft components, the effect of threat induced damage in a combat environment becomes increasingly important. Aircraft structural designs using composite materials tend to present some unique problems which need to be further explored. The objective of this program is to investigate the effects of nonnuclear threat mechanisms on aircraft structures fabricated from composite materials. As the result of this effort, the effects of threat damage mechanisms on composite structures will be understood and will provide a data base for the development of survivable composite structure design criteria and guides.

To be investigated is the damage that results from the interaction of nonnuclear threat mechanisms with composite structures and the effects that such damage has on the strength of the composite structures. Factors associated with the investigation will be threat types and the damage mechanism associated with each type of threat, various types of composite materials and structural concepts, the application of the various composite structural concepts, the damage produced by the various threat mechanisms and the effects on the strength of the structural composites produced by the damage. Data voids will be identified and test plans developed to fill these voids.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Flight Dynamics Lab.

1.0041, EXTENSION OF FLEXSTAB FOR ANALYSIS ACCURACY AND EFFICIENCY
J. Dornfeld, Boeing Co., *7555 E. Marginal Way S., Seattle, Washington* 98124 (DF138870; F33615-76-C-3170)

This work unit supports TPO 3, flight control, and major thrust FG02B, flight control system design techniques. Specifically this work unit will identify errors/or inefficiencies in, and add capabilities to, level 3.01.00 FLEXSTAB computer program systems. The objectives of this work unit are to (a) modify FLEXSTAB to allow the aeroelastic analysis of cantilevered, flexible wind tunnel models, (b) modify FLEXSTAB to include Kussner-Wagner indicial lift growth functions for increased accuracy when analyzing higher frequency modes and gust aerodynamics, modify FLEXSTAB to optionally allow a linear time response capability in addition to the current nonlinear time history analysis capability, (c) improve the accuracy of the hinge moment calculation, (d) modify FLEXSTAB to more efficiently handle, store, and operate upon matrices in order to effect a 50 percent - 80 percent cost savings for matrix operations, (e) correct all known and newly discovered errors in the FLEXSTAB coding and documentation. When this work unit is completed all errors and inefficiencies in level 3.01 FLEXSTAB CPS and documentation will either be corrected (money permitting) or identified in detail for later correction.

This work will consist of analytical and experimental studies to determine the best methods to modify FLEXSTAB to produce a more accurate and cost-effective prediction method. The approach is to (1) formulate dynamic load equations based on level 2.01.00 perturbation output, (2) incorporate these equations into the control-free analysis programs, (3) determine limits of applicability, (4) recommend other in-house and contracted efforts, (5) provide additional support. Reports will be prepared during the course of this effort to document significant accomplishments.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Flight Dynamics Lab.

1.0042, MICROSTRUCTURAL CHANGES FOLLOWING SUPERPLASTIC DEFORMATION OF TI-6AL-6V

A. Rosen, Technion, *Haifa, Israel* (DF289520; AFOSR-77-3441)

AF function - research in improved and lower cost air frame components. Deficiency - present methods for the fabrication of titanium components result in high cost. Furthermore, little is known of the post forming response of superplastically shaped titanium, a low cost approach. How research contributes - it is expected to find answers to the following questions - (1) What is the effect of temperature on the mechanism of superplastic deformation? It is well known that the volume fraction of beta is strongly temperature dependent, and therefore, the change of the alpha/beta ratio may influence the deformation mechanism. (2) If superplastic deformation is controlled by grain boundary sliding, what is the role of the alpha-alpha, beta-beta and alpha-beta grain boundaries? (3) What is the mechanism which eliminates void formation during grain boundary sliding? (4) Is there any change of structure due to superplastic deformation? (5) What is the role of plastic deformation on grain growth?

The aim of the proposed research is to understand the mechanism of superplastic deformation of Ti-6Al-4V by means of direct observation of the structure in the transmission electron microscope. Direct observation of the microstructure and the structural changes which take place during superplastic deformation is not feasible due to lack of appropriate equipment. Instead, this approach is to freeze - in the high temperature structure which develops during superplastic forming - and to compare it with the structure which develops under similar conditions, but without application of stress. Tensile testing will be carried out in vacuum at various temperatures and strain rates in a specially designed apparatus.

SUPPORTED BY U.S. Dept. of Defense, Air Force, European Office of Aerospace Research & Development

CHEMISTRY AND MATERIALS

Includes Chemistry and Materials (general); Composite Materials; Inorganic and Physical Chemistry; Metallic Materials; Nonmetallic Materials; and Propellants and Fuels.

3.0001, SULFUR IN THE CORROSION OF SUPERALLOYS 14925-MS

J.B. Wagner, Arizona State University, Graduate School, *Tempe, Arizona* 85281 (DA0F9141; DAAG29-78-G-0032)

Investigate high temperature degradation of metals in sulfur-containing gases, to contribute to an understanding of the transport of sulfur through oxides and to determine the role of surface finish and subsequent protectiveness to oxide films formed in SO sub 2-O sub 2 gas mixtures. Relevance - the research is relevant to the hot corrosion of turbine components and to the Army program to develop improved hot corrosion resistant coatings for high temperature alloys.

Oxidation of pure nickel and cobalt in SO sub 2-O sub 2 gas mixtures, with particular attention directed at the role of oxide morphology and metal surface preparation on the subsequent structure of the corrosion product. Radiotracer diffusion of sulfur-35 in cobaltous oxide single crystals to determine whether anomolous penetration profiles as seen on nickel surfaces is a general phenomena.

SUPPORTED BY U.S. Dept. of Defense, Army Materiel Development & Readiness Command, Army Research Office

3.0002, A STUDY OF MATERIALS PHENOMENA AND LOW-TEMPERATURE PROCESSES

R.A. Armistead, Advanced Research & Applications Corp., *1223 E. Arques Ave., Sunnyvale, California* 94086 (DF051030; F49620-78-C-0010)

AF function - the proposed research primarily falls in the 2.3 research objectives which deal with developing superconducting materials with higher transition temperatures, higher upper critical magnetic fields, lower AC losses and higher current carrying capabilities. Deficiency - new approaches to Air Force power generation and distribution and remote sensing and detection of electromagnetic radiation depend upon new and improved superconducting materials. Josephson junction devices are needed for ultrasensitive detectors of electromagnetic radiation especially in the ranges of 1-100 microns and 10-6 to 10-5 Gauss. Objective - the subject concerns nonequilibrium processes and Josephson tunneling in superconducting films. Contribution - this research is a part of a program in low temperature physics.

The studies in the Josephson tunneling I-V characteristics of superconductors in nonequilibrium state will be conducted in crossed film, superconductor/oxide/superconductor junctions. The crossed film junctions will be fabricated by thermal evaporation of Sn. A slow oxidation, and a second thermal evaporation of the second Sn electrode will form a complete Sn-SnO-Sn junction. These films make reliable junctions with easily attainable transition temperatures (37 degrees K). they are also useful for forming the first electrode and insulating layer of junctions using another material, for example, Pb or In, for the second superconducting electrode. Such systems allow the study of superconducting energy gaps from quite-different, more strongly coupled, superconducting materials.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Office of Scientific Research

3.0003, ENVIRONMENTAL DURABILITY OF FIBER-REINFORCED COMPOSITES 14414-MS

D.H. Kaelble, Rockwell International Corp., *1049 Camios Dos Rios, Thousand Oaks, California* 91360 (DA0E9297; DAAG29 77 C 0005)

To determine the physicochemical mechanisms of environmental durability and degradation of graphite-epoxy and fiberglass-epoxy composites under hydrothermal (high moisture and temperature) exposure. Relevance - the research is directly relevant to the degradation of the structure and properties of epoxy matrix composites, which are being used (or considered for use) in many Army components, e.g., aircraft, portable bridges, missile launch tubes and motor cases, tank wheels.

Determine the effects of moisture and temperature on the composition and bonding of the fiber-matrix interface; evaluate loss of bonding at the fiber-matrix interface by measurement of interlaminar shear strength; and determine the effects of moisture and temperature upon the bulk properties of the matrix epoxy, e.g., composition, adhesive aspects, and rheology.

SUPPORTED BY U.S. Dept. of Defense, Army Materiel Development & Readiness Command, Army Research Office

3.0004, CHEMICAL PHYSICS OF CHARGE MECHANISMS IN NONMETALLIC SPACECRAFT MATERIALS

J.E. Nanevicz, S R I International, *300 Ravenswood Ave., Menlo Park, California* 94025 (DF048670; F49620-77-C-0113)

AF function - operational and future Air Force space systems are required to perform their missions in extreme service environments. Deficiency - the interaction of a synchronous-orbit satellite with its environment activates electrification and electrical discharge processes producing electromagnetic noise pulses and effluents which deteriorate satellite materials, surfaces and components. Objective - the objective is to perform research to understand the mechanisms underlying spacecraft charging in polymeric and other nonmetallic dielectrics. How work contributes - it is expected that this research will contribute to the establishment of guidelines for the design and modification of satellite materials which are not degraded by the effects of electrical charging and which will minimize disruptions in Air Force space systems mission performance.

(a) Study nature, causes and effects of charging and discharging processes in typical spacecraft polymers and other non-metallic dielectrics under orbital conditions, (b) deter physics of critical electrostatic charging phenomena and properties of materials that affect electrostatic charging properties, and (c) study methods for modification of materials properties to improve their in-space performance characteristics.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Office of Scientific Research

3.0005, LABORATORY MEASUREMENTS OF PHOTOLYTIC PARAMETERS OZONE (O3)
Unknown, S R I International, *300 Ravenswood Ave., Menlo Park, California* 94025 (FA78WA-4263; FA161583 (TRAIS NO.))

The contractor will measure the absorption cross-section and quantum yields of all product branches on the photolysis and ozone (O3) as a function of temperature (between 200 and 300 K) and wavelength range. The experimental approach will be based on 1) a neodymium-YAG pumped doubled dye laser which shall be used as a photolysis source; 2) a multichannel analyzer system which will be used to monitor the O(1D) emission at 630NM and the O(3P) resonance fluorescence at 130.5 NM; 3) the temporal behavior; and 4) the absorption coefficients for ozone from 270 to 350 NM over a temperature range of 200-300 K which will be determined in a long path absorption cell.

SUPPORTED BY U.S. Dept. of Transportation, Federal Aviation Admin.

3.0006, FILM SYNTHESIS AND NEW SUPERCONDUCTORS
T.H. Geballe, Stanford University, School of Engineering, Dept. of Materials Science & Engineering, *Stanford, California* 94305 (DF050440; F49620-78-C-0009)

AF function - high temperature superconducting materials are needed for application in airborne multi-megawatt power generation and conditioning systems. Opportunity - research specifically directed toward the synthesis and characterization of high transition temperature metallic compounds can provide a greater margin of design efficiency and operational reliability than presently available superconductors. Objective - the research studies fundamental mechanisms which give rise to superconductivity, explores the occurrence of superconductivity in compounds and composites, synthesizes films with optimal superconducting transition temperatures, and seeks a model for predicting high temperature (above 23 degrees K) superconducting state in metastable metallic phases. How work contributies - the performance of high field magnets and solenoids, electric motor windings, superconducting rotors in power generators, transformers and induction energy storage systems could be significantly improved if the upper critical field, the current-carrying capacity and the critical transition temperature of the superconducting material could be enhanced.

Metastable phase equilibria at lower temperatures are being studied by utilizing the unique capability of the electron-beam codeposition apparatus to lay down intimate mixtures of two or more components on a substrate whose temperature is subject to independent control. The high superconducting transition temperature A-15 phases are being investigated. Particular attention is given to Nb3Ge, Nb3Si, and ternary compounds derived from them. The superconducting properties are being correlated with the new phases using sensitive thermal and electrical techniques as well as crystallographic and metallurgical methods.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Office of Scientific Research

3.0007, FUNDAMENTAL APPROACH TO PROBLEMS IN CERAMIC ENGINEERING
D.M. Esterling, George Washington University, School of Engineering & Applied Sciences, Dept. of Civil Engineering, *725 23rd St. N.W., Washington, District of Columbia* 20037 (DF046050; AFOSR-77-3114)

This proposed research primarily falls in the 2.1 research objectives which deal with failure processes. Basic research to identify new families of ceramic materials capable of economical consolidation to densities approaching 100 percent and possessing improved creep and thermal fatigue resistance is needed for extending limits of future generation expendable and recoverable high temperature turbine engine components. A rational basis for the development of alloys, nonmetallic materials, ceramics, and composites which are stronger is needed for all Air Force systems. Deficiency - failure processes such as fatigue, fracture, and creep are in most cases intimately related to the microstructures of alloys, polymers, ceramics, and composites. Understanding of these processes and properties mechanisms must be integrated with appropriate constitutive equations and appropriate failure criteria. Considerable progress can be achieved in structural reliability and integrity as a result of some basic studies. Objective - the objective of this research is to study the microstructure responsible for the mechanical properties of materials on an atomic scale. The areas to be investigated include the structure and energy of large angle grain boundaries, impurity-dislocation interactions and crack-grain boundary interactions. Contributions - this research is a part of a comprehensive program to use statistical mechanics on real systems.

An alternative approach to problems in ceramic engineering is proposed, exploiting the constructs and methodology of solid state physics. The analysis will be taken one level beyond the microstructure investigating atomic processes and their role in determining the microstructure. It is proposed to computer simulate crack tips, dislocation cores, and grain boundaries within a lattice (as compared to continuum) model employing realistic potentials. The present lattice model which is based on a variation of the lattice statics method will be improved. The potentials will be derived using recently developed techniques in quantum chemistry as well as the more established pseudopotential method.

3.0008, ORIGIN OF N-ALKANES IN JET FUELS DERIVED FROM SHALE OIL, COAL AND TAR SANDS
R.N. Hazlett, U.S. Dept. of Defense, Navy, Naval Research Lab., *4555 Overlook Ave. S.W., Washington, District of Columbia* 20375 (DN880122)

The purpose of this research is to determine how N-alkanes in the jet fuel range are formed in the thermal processes used to produce liquid fuels from shale oil, coal and tar sands. A further objective is to suggest variations of thermal processes or refining procedures which will result in a lower concentration of N-alkanes, thus relieving the jet fuel freezing point problem.

The original resource material will be analyzed to define the potential for N-alkane formation. Then thermal processes such as retorting, pyrolysis and delayed coking will be examined by varying system parameters such as temperature, pressure and time.

3.0009, RELATIONSHIP BETWEEN MICROSTRUCTURE AND MECHANICAL PROPERTIES OF INTERMETALLICS
J.J. Hren, State University System of Florida, University of Florida, School of Engineering, Dept. of Materials Science & Engineering, *220 Black Hall, Gainesville, Florida* 32611 (DF047770; AFOSR-77-3254)

AF function - requirements for gas turbine engines include strong, lightweight, oxidation resistant materials for high temperature operation. A need exists for materials to operate at higher engine temperatures (to improve operating efficiency), and for lighter weight materials (to decrease engine weight, engine operating stresses due to heavy components, and fuel consumption). The needed materials must have the same density as titanium combined with the mechanical properties and oxidation resistance of nickel base superalloy. Opportunity -intermetallic compounds in general, and the titanium aluminides in particular, have exhibited great potential for such applications. Unfortunately, nearly all intermetallic compounds are brittle at low temperatures, making their fabrication difficult and presenting potential hazards in service. However, recent reports indicate that some alloying additions can substantially improve low temperature ductility. Objective - this research will determine the intrinsic mechanisms of deformation and the available means for their control in a wide class of intermetallic compounds. How work contributes - initially; the investigation will be directed towards clarifying the source of improved ductility in the titanium aluminides.

The research will involve fabrication, testing, and detailed microstructural analysis of a range of alloys. Prime goals will be to

deduce the microstructural sources of these beneficial effects and to discover guidelines for more general application. The strength of these studies is founded on the use of advanced electron metallographic techniques.

3.0010, NAVY ENVIRONMENT - STUDIES OF DELAYED FRACTURE MECHANISMS IN ALUMINUM ALLOYS USED IN NAVAL AIRCRAFT AND BOAT STRUCTURES

J.A. Green, Martin Marietta Corp., *1450 S. Rolling Rd., Baltimore, Maryland* 21227 (DN723866; N00014-74-C-0277)

The investigators seek to determine the causes and mechanisms responsible for delayed failure in many strength aluminum alloys used in naval structures when stressed in the marine environment.

The effect of microstructural and compositional variations on a macro- and micro-scale on the delayed fracture behavior of Al-Zn-Mg alloys is being studied. Structure and compositional variations are achieved by heat treatment and characterized by standard metallurgical techniques. Tensile fracture tests are conducted in various environments and fracture characteristics are correlated with structure and composition. A description of the mechanisms of delayed fracture in terms of variations in material, stress and environmental conditions is sought.

3.0011, MATERIALS SUPPORT TECHNOLOGY - PHOTO AND IMPURITY EFFECTS IN AMORPHOUS COVALENT SYSTEMS AND FORMATION OF AMORPHOUS METALLIC ALLOYS

D. Turnbull, Harvard University, Cambridge Campus, Div. of Engineering & Applied Physics, *Cambridge, Massachusetts* 02138 (DN775040; N00014-77-C-0002)

Some amorphous metals have been shown to possess unusual physical or mechanical properties suggesting possible Navy use in soft magnet applications, photosensitive materials, high strength reinforcements, magnetic bubble materials, etc. This effort will investigate several factors which may affect the structure and properties of these interesting materials.

This program will explore the photosensitive nature of A-As2Se3 and A-As2S3 and compare the results to A-Se, which was previously shown to crystallize as a result of photoillumination. Factors affecting retention of the amorphous state in metals will be determined. Of special interest are compositional and thermal effects on formation and crystallization of these glassy metals. Accordingly diffusivity and viscosity behavior below TG will be determined.

SUPPORTED BY U.S. Dept. of Defense, Navy, Office of Naval Research

3.0012, MATERIAL SUPPORT TECHNOLOGY - GRAPHITE INTERCALATION COMPOUNDS

M.S. Dresselhaus, Massachusetts Inst. of Technology, School of Engineering, Dept. of Electrical Engineering, *77 Massachusetts Ave., Cambridge, Massachusetts* 02139 (DN775125; N00014-77-C-0053)

Intercalated graphite compounds have exhibited high conductivities. Research has been directed towards achieving conductivity equal to or greater than that for copper. Many naval systems could benefit from a light, strong metallic fiber. The objective of this program is to determine the electronic structure of these compounds in order to correlate the electrical behavior with their atomic structure and composition, with the view to being able to design better conductors.

Metallic graphite intercalation compounds are studied by Raman and infrared spectroscopic techniques to determine those lattice modes which can be identified with vibrations of the carbon atoms in the graphitic layers and other modes specific to each intercalate species. These results are combined with theoretical studies to determine the electronic structure of the compound when graphitic and intercalate layers are brought together to their equilibrium separation in the intercalation compound. Both acceptor and donor intercalation compounds are studied and special attention is given to the symmetry properties of the Raman and infrared spectra to provide information on the inplane ordering of the intercalate layer planes.

3.0013, PREPARATION AND CHARACTERIZATION OF INFRARED MATERIALS

A.F. Witt, Massachusetts Inst. of Technology, School of Engineering, Dept. of Materials Science & Engineering, *77 Massachusetts Ave., Cambridge, Massachusetts* 02139 (DF046960; AFOSR-77-3202)

AF function - aerospace communications surveillance and detection systems require electro-optical devices which exploit the special properties and interactions of infrared radiation with solid state materials. Opportunity - infrared materials research has high potential for airborne and satellite applications. Sophisticated electro-optical techniques and characteristics of narrow band-gap compound semiconductors offer promise for electro-optical microcircuitry in the spectral range 10 to 100 micrometers. Objective - the aim of this research is to optimize compositional homogeneity and to control compositional variations in III-V and II-VI semiconductor compounds. The goal is to establish quantitative relationships between growth parameters and materials characteristics and to utilize the special properties of these materials for electro-optical device concepts and components. How work contributes - infrared detectors and tunable infrared sources of coherent radiation require solid state materials with narrow band gaps, controlled carrier concentrations and doping to provide optimal performance characteristics for sensing and for communicating in an aerospace environment.

To obtain infrared materials with the specified compositional control requires basic modifications of conventional crystal growth systems. For the growth of intrinsic InSb the hot-zone of a Czochralski system is to be modified through the installation of a coaxial sodium heat-pipe. InSb with modulated carrier concentration is to be obtained by appropriate N-type current pulsing during rotational and/or non-rotational pulling. Heavily doped (Bi, Tl) InSb is to be grown in a modified Bridgman-Stockbarger system in which the onset of constitutional supercooling is delayed by means of differentially operated heat-pipes which permit the establishment of maximized thermal gradients across the growth interface. All materials grown are to be quantitatively characterized for compositional distribution, crystalline perfection and for potential application as infrared detectors or sources.

3.0014, ELECTROPLATING ON TITANIUM

C. Levy, U.S. Dept. of Defense, Army, Army Materiel Development & Readiness Command, Materials & Mechanics Research Center, *Watertown, Massachusetts* 02172 (DA0G4813)

The objective is to develop a method for applying adherent electrodeposits on titanium alloys.

Alloy composition electrodeposits will be plated followed by low temperature diffusion treatments of less than 1100 degrees F. Adhesion will be evaluated by metallographic examination and ASTM methods.

SUPPORTED BY U.S. Dept. of Defense, Army Materiel Development & Readiness Command, Materials & Mechanics Research Center

3.0015, DEVELOPMENT OF NEW FIRE RESISTANT POLYMERS

R.E. Singler, U.S. Dept. of Defense, Army, Army Materiel Development & Readiness Command, Materials & Mechanics Research Center, *Watertown, Massachusetts* 02172 (DA0D4697)

To develop high-strength, chemically resistant, thermally stable polymers with a phosphorus-nitrogen backbone which will be evaluated for use in nonflammable coatings, foams and insulation, hydraulic fluids, and other applications. Major thrust - survivability, night operations, aircraft and combat vehicles.

Exploratory synthesis will be continued in the area of poly (aryloxy and aminophosphazene) copolymers. Chemical modifications will be studied in attempts to prepare phosphazene terpolymers, suitable for cross-linking, and cyclolinear polyphosphazenes. These polymers will be investigated for both closed-cell and open-cell foam applications. Polymerization conditions will be manipulated in order to prepare phosphazene oligomers as fire resistant hydraulic fluids. The thermal mechanical behavior and morphology of these polymers will be investigated to determine structure-porperty relationships for the polyphosphazenes. The large scale laboratory synthetic effort will be continued to provide sufficient quantities of polymers for laboratory processing studies and long term environmental deterioration studies.

SUPPORTED BY U.S. Dept. of Defense, Army Materiel Development & Readiness Command, Materials & Mechanics Research Center

3.0016, RECYCLING EXISTING PAVEMENT MATERIALS FOR PAVEMENT REHABILITATION

T.D. White, U.S. Dept. of Defense, Army, Corps of Engineers, Waterways Experiment Station, *P.O. Box 631, Vicksburg, Mississippi* 39180 (DA0Z8026)

Current construction state of the art includes recycling processes for asphalt pavements. Recycling asphalt pavement can provide economic, logistic, environmental, and technical benefits. However, there is a lack of definitive criteria that would take advantage of functional properties of the recycled material. It is proposed that a study be initiated to develop design and construction criteria for recycling asphalt concrete. This objective would best be accomplished by a laboratory study of pertinent material and mechanical properties. Test data from this study would form a data base from which to generate criteria and means of evaluating the capability and performance of recycled asphalt paving materials.

The intent of this study is to develop criteria for re-use of existing asphalt concrete airfield pavements. The study will encompass a review of procedures for breaking up and re-using embrittled asphalt, laboratory tests on recycled mixtures, establishment of quality provisions for recycled mixtures, and preparation of a technical report containing criteria recommendations.

SUPPORTED BY U.S. Dept. of Defense, Corps of Engineers, Waterways Experiment Station

3.0017, WEAPONRY - PROCESSES AFFECTING COMBUSTION OF SOLID PROPELLANTS

L. Caveny, Princeton University, School of Engineering & Applied Sciences, Dept. of Aerospace & Mechanical Science, *Box 430, Princeton, New Jersey* 08540 (DN623049; N00014-75-C-0705)

The Navy missile arsenal contains a wide variety of solid propellant rockets, and it is the objective of this task to advance the understanding of performance behaviors of solid propellants, and thereby lay the scientific groundwork for solid propellant rocket developments of the future. The main emphasis here is on solid propellant combustion embracing the description and incorporation into theoretical scheme all processes, physical and chemical, which occur during the burning of a solid propellant. The fundamental studies of this task form the bases for selection of propellant ingredients and physical design of the solid propellant grain which may be used in Navy ordnance rockets, as well as in solid propellant rockets for any application.

The pressure dependence of the burning rate of RDX and RDX composite propellants will be studied emphasizing the kinetics of RDX decomposition and the rates of reaction of the decomposition products. These rate data will be used in models of the burning process that include reaction, momentum, energy, and mass transfer rates.

SUPPORTED BY U.S. Dept. of Defense, Navy, Office of Naval Research

3.0018, SOLID ELECTRODE STUDIES RELATED TO CORROSION PREVENTION, FUEL CELLS AND BATTERIES

S. Bruckenstein, State University of New York, Buffalo Campus, School of Arts & Sciences, Dept. of Chemistry, *3435 Main St., Buffalo, New York* 14214 (DF037220; AFOSR-74-2572)

AF function - Air Force operational environment's power generation is relied on through electrochemical power sources, such as batteries and fuel cells. Deficiency - the detrimental effects of corrosion on AF equipment is also involved with electrochemical reactions. Objective -research involves the study of solid electrode surfaces processes, and the phenomena that influence these processes. How work contributes -results will give a better understanding of the adsorption and formation of products on the surface of the electrodes, as well as the potential corrosion sites.

Emphasis of this research will involve 'underpotential' metal deposition. It deals with an adsorption of a metal ion with some charge transfer at a potential more anodic than the equilibrium potential of the ion in contact with its reduced form in the metallic state. The exact description of these adsorbed species on the electrode surface is to be determined. Sinusoidal hydrodynamic modulation (SHM) and small signal A.C. techniques will be employed in the underpotential adsorption studies. The principal experimental technique will involve the rotating ring-disk to separate out the partial currents for alloy dissolution from the cathodic process leading to the mixed potential.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Office of Scientific Research

3.0019, EFFECT OF BONDING CHARACTERISTICS ON METAL MATRIX COMPOSITE PROPERTIES

R.G. Carlson, General Electric Co., *1 Jimson Rd., Cincinnati, Ohio* 45215 (DF047990; F49620-77-C-0067)

AF function - Air Force propulsion systems of the future are expected to contain metal matrix composites because of their attractive mechanical properties at substantially reduced weight. Opportunity -however, a better technical understanding is required for design and application of this class of materials. In addition, this understanding is anticipated to provide for improved impact resistant materials for fan and compressor blades, and to allow for lower cost processing and fabrication of metal matrix composites. Objective - this research will develop an understanding of the metal matrix composites to effect a balanced increase in mechanical properties, placing specific emphasis on increased impact resistance. How work contributes - this technology can then be translated into composite systems in general, including resin matrix composites, and lead to more extensive application of composite materials to aircraft propulsion systems.

This program is directed toward understanding the basic bonding mechanisms of metal matrix composites, specifically between boron filaments and an aluminum matrix. The effort consists of three tasks -(1) surface preparation and characterization of single sandwich panels incorporating both aluminum and boron surface treatments, (2) upon extraction of correlative data, larger 8-ply panels will be selected and fabricated, and scrutinized by nondestructive evaluation, (3) the larger panels will be sectioned, and selected mechanical and physical properties will be evaluated in order to ascertain generic coupling/property behavior.
